Meanwhile, the leftist Aprista (People's) party, outlawed in 1948, was reorganized for more effective underground activity. Aprista leader Víctor Raúl Haya de la Torre, who had been a fugitive since the time of the Odría revolution, and had taken refuge in the Colombian embassy in January, petitioned for safe conduct out of Peru, which was denied by the military regime on Feb. 24. Safe conduct was similarly denied to Fernando León de Vivero and Pedro Muñiz, Apristas who had found sanctuary in the Cuban embassy; and Peru severed diplomatic relations with Cuba on Aug. 19, when it was discovered that León de Vivero and Muñiz had escaped to Havana.

The Odría government developed a program of relaxing controls over foreign exchange, imports and exports. Duty-free importation of agricultural machinery and implements was extended for five years by a decree dated May 25, and President Odría declared on June 2 that the country needed foreign capital to develop technical skill, transportation facilities and irrigation projects. Operations of the Peruvian International Airways were suspended on Feb. 28, when the company was unable to satisfy claims amounting to $800,000 due general creditors and $4,000,000 due note holders.

International conferences and fairs held in Peru during the year included the second Inter-American Conference on Indian Life, which opened at Cuzco on June 24; the fourth South American Conference on Broadcasting, which met at Lima in June; and a world's fair, sponsored by the National Tourist corporation of Peru, held at Lima during October and the first half of November. (G. I. B.)

Education.—In 1944 there were 7,647 public and private primary schools with about 717,000 pupils. The 61 public secondary schools had 12,474 students; there were also about 100 secondary schools, most of which were conducted by religious orders. University education was available at four public universities—Lima, Arequipa, Cuzco and Trujillo—and at the Catholic university of Lima. Appropriations for education in 1949 comprised 16% of estimated government expenditures.

Finance.—The monetary unit is the sol, valued at $0.0538 U.S. currency, free rate, on Oct. 19, 1949. The budget for the fiscal year 1949 balanced government revenue and expenditure at 1,150,000,000 soles. Estimated revenue included indirect taxes, 465,066,000 soles; direct taxes, 217,950,000 soles; and monopolies and state undertakings, 129,-492,000 soles. The direct public debt on June 30, 1948, totalled 1,714,-748,434 soles, made up as follows: external dollar and sterling consolidated debt, 595,049,590 soles; internal consolidated debt, 533.880,865 soles; internal floating and short-term debt, 585,817,979 soles. Notes in circulation on Oct. 31, 1949, totalled 792,000,000 soles; the gold reserve was $20,000,000. Sight deposits on Oct. 31, 1949, totalled 1,192,-000,000 soles; time deposits were 598,000,000 soles.

Trade and Communications.—Exports in 1948 totalled 1,018.413.802 soles; imports were 1,090,619,923 soles. Chief exports were cotton (26%), sugar (22%) and petroleum and products (18%). Principal customers were the U.S. (25%), Chile (19%) and the United Kingdom (16%). Chief suppliers were the U.S. (54%), Argentina (18%) and the United Kingdom (7%).

Railways (1947) totalled 2,612 mi., of which 2,101 mi. were privately owned and 511 mi. state-owned. In 1947, 5,560,713 passengers and 3,724,466 short tons of freight were carried. Motorable roads (1947) totalled 21,554 mi. Motor vehicles (1948) included 20,817 automobiles, 2,160 buses and 16,112 trucks. The principal domestic air line (Compania de Aviacion Faucett) carried 90,486 passengers and 5,867 short tons of cargo in 1948. According to *Lloyd's Register of Shipping*, the merchant marine had 40 steamers and motor ships (100 tons and over), aggregating 86,564 gross tons, on June 30, 1948. Telephones (1948) totalled 43,000.

Agriculture.—Agriculture engaged a large majority of the people; in 1949 about 3,800,000 ac. out of a total arable area of 29,500,000 ac. were under active cultivation. Production of cotton, the chief crop, in 1948 was about 65,950 short tons. Sugar output (1948) included 519,135 short tons, centrifugal, and 28,656 tons, open-pan. Rice production (milled) totalled 151,982 short tons in 1948, a record figure.

In 1946 there were 2,662,000 cattle, 17,288,000 sheep and 931,000 goats. There were more than 1,000,000 alpacas and about one-half that many llamas. In 1948, 8,588 short tons of sheep wool and 2,638 tons of alpaca hair were produced. Rubber production (1948) totalled 1,789 short tons, all of which was used locally. Other forest products included cube (barbasco root; exports, 1947: 5,807 short tons), tagua, quinine, copaiba and quillaia.

Manufactures.—There were in 1949 5 cotton spinning mills, 11 cotton textile mills, 7 rayon weaving mills and a rayon yarn plant. Production of tires in 1948 totalled 87,180 units, and the single cement factory produced 1,653,940 bbl. Paper production was 19,990 short tons. A total of 28 fish-canning plants was in operation. The cost-of-living index stood at 405 in Oct. 1949, and the wholesale price index at 582 (1937=100).

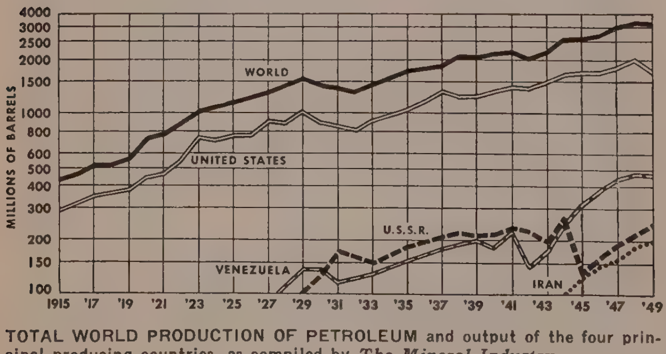
Mineral Production.—Production of the principal minerals in 1948 (value in parentheses) was as follows: copper, 19,917 short tons (57,864,998 soles); silver, 9,288,500 oz. (44,896,374 soles); gold 111,160 oz. (25,289,582 soles); vanadium, 1,006 short tons (3,596,901 soles). Crude oil production totalled 14,068,880 bbl., valued at 242,336,458 soles.

Petroleum.

The year 1949 removed completely the U.S. oil shortage scare of 1947–48. Notable additions to reserves were found in the United States, Canada and Venezuela. The calculated movement under the Economic Cooperation administration to keep U.S. oil exports down and to expand producing and refining facilities abroad in order to supply foreign demand from foreign oil also had a decided effect in deflating the U.S. shortage bubble.

Important Anglo-American oil conferences were held during 1949 on the difficult problems of the dollar deficit. Washington talks began in September, at a time when the sterling area was spending $400,000,000 a year on dollar oil, more than half for the United Kingdom. U.S. oil companies had been long established in foreign markets including the United Kingdom. Their crude oil and refined product supplies for these markets, formerly chiefly shipped from the United States, had been drawn increasingly from their operations in the middle east, Venezuela and other foreign sources. Late in the year it was reported the British government had ordered a drastic cut in British purchases of dollar oil. At the same time ECA officials met in Paris with representatives of Marshall plan nations in an effort to get them to cut back their petroleum refinery expansion programs.

Estimated U.S. oil production of 5,040,000 bbl. daily in 1949 indicated a slight decline from 1948. After early cutbacks, Venezuela oil output reached new all-highs in September and again in October—1,426,500 and 1,433,000 bbl. daily, respectively. During the same months middle east production (Bahrein, Iran, Iraq, Kuwait and Saudi Arabia) maintained figures of more than 1,300,000 bbl. daily.



TOTAL WORLD PRODUCTION OF PETROLEUM and output of the four principal producing countries, as compiled by *The Mineral Industry*

World Production of Crude Oil
(In thousands of barrels)

Year	United States	Per cent	Rest of world	Per cent	Total worl

Foreign oil production since the first recorded output—1857 through 1949—amounted to 61,600,000,000 bbl., of which U.S. interests produced 38,900,000,000 bbl., or 63%. Since 1945 the trend of oil production outside the United States had been substantially upward. World production in 1949 was estimated at 1,505,000,000 bbl., compared with 881,259,000 bbl. in 1945. Thus, in 1949, foreign oil production was 45% of the world's, compared with 34% in 1945; the United States, 55%, compared with 66% in 1945. The middle east, South America and Canada reported substantial increases in oil production during 1949. With foreign reserves substantially greater than those of the United States, and with increasing rates of production in such areas seeking world markets, imports of foreign oil into the United States increased 24% in 1949, while U.S. oil exports declined 11%.

Demand for petroleum and its products in the United States continued at near record-breaking levels. Total consumption, including exports, was at the rate of 6,105,000 bbl. daily, compared with the all-time peak of 6,129,000 bbl. daily recorded in 1948. Total demand, including exports, had increased about 40% since 1941, while supply during this period had expanded by 41%.

New capital expenditures in producing, refining, marketing and transportation facilities in 1949 exceeded $2,000,000,000; total expenditures of this kind during the three years 1947–49 had amounted to $6,400,000,000. Estimated gross capitalization of the U.S. oil industry exceeded $23,000,000,000 in 1949.

Exploratory drilling in the United States in 1949 was at the highest rate in the history of the industry, with 9% more wildcat wells drilled. A new deep drilling record exceeding 20,000 ft. was made. In 1948, 4,200,000,000 bbl. of U.S. petroleum liquid reserves were added, making the proved underground inventory nearly 27,000,000,000 bbl. at the end of the year, after a production of more than 2,000,000,000 bbl. of oil. Further substantial additions were made to reserves during 1949.

The ratio of reserves to production was about 13, approximately the same as for the preceding 24 yr. In fact, the ratio of reserves to production in 1925 was 10; since that date the United States had produced more than four times as much oil as was then reported to be in proved reserves, and it still had 27,000,000,000 bbl. in the unproduced underground inventory.

At the close of 1949 there were 443,600 producing oil wells and 64,750 natural gas wells in the United States, producing in 28 states. Petroleum refining capacity had been expanded since 1939 by more than 40% to provide for the increased consumer

LUID CATALYTIC CRACKING UNIT under construction, in 1949, at the ayway refinery of the Standard Oil Co. of New Jersey, in Linden, N.J.

emand. On Dec. 31, 1949, the nation's oil refineries had a ombined daily crude oil capacity of about 6,550,000 bbl., comared with a daily capacity at the close of 1939 of 4,721,213 bbl.

More than $100,000,000 annually was being spent by the U.S. il industry in scientific research. One-third of all the chemicals roduced in the United States were based upon petroleum or atural gas. (*See* also CHEMISTRY.) (L. M. F.)

Philadelphia. Philadelphia, Pa., was the third largest city in the United States in 1940 with a total poplation of 1,931,334. By Jan. 1, 1949, the population had inreased approximately 11.3%, to an estimated total of 2,150,000. There was an additional 1,450,000 population in the seven ounties of Pennsylvania and New Jersey which are immediately djacent to the city and commonly included in the Philadelphia etropolitan area. The administration of the city in 1949 was Republican; the mayor was Bernard Samuel.

During 1949, construction of public improvements in Philaelphia involved capital outlays totalling $65,000,000 and covred a wide variety of municipal services. Largest with respect o total outlay was the construction of further units in the rogram to abate river pollution by constructing intercepting ewers and disposal plants to treat all of the city's sewage. Waterworks projects included, in addition to other improvements of the pumping, filtration and distribution works, the rgest plant in the world to treat water by the ozonation rocess.

For the improvement of transportation facilities, work connued on extension of the Market Street subway and on station acilities of the Frankford elevated railroad. An outstanding evelopment was revision of the state highway system in Philaelphia to include the Schuylkill expressway, Philadelphia's first xpressway. With its connections, the expressway would comprise a major part of the city's highway system. Work progressed jointly by the city and state on the new Penrose Avenue bridge across the Schuylkill river and on the widening of Vine street as an approach to the Philadelphia-Camden bridge across the Delaware river. Hundreds of installations were made for better regulations of traffic. Bridges were completed over Cobbs creek and Frankford creek, and the first prestressed concrete bridge in the United States was started to carry Walnut lane over Lincoln drive.

In the city's program to improve and extend its recreation facilities, 8 recreation centres were rehabilitated; new buildings were erected at 13 centres; and 47 new sites were fenced and graded for immediate use.

A reception centre for dependent children was put in service; work proceeded on a new neurological building at the Philadelphia General hospital; one branch library was completed, and another was started; and a new Carnivora building was begun at the zoological garden. Plans advanced for the redevelopment of ten areas of the city and for the construction of public housing.

The level of industrial employment, which had attained a peak of more than 350,000 in 1947–48, dropped only slightly during 1949. Total bank deposits also attained an all-time high in 1947 but decreased slightly during the next two years. Approximately 50,000 new dwelling units had been constructed since 1940, and an additional 30,000 had been created by the conversion of existing single family structures into apartments. Residential construction decreased slightly during 1949, but there was a considerable increase in industrial and commercial construction. (B. SA.)

Philanthropy: *see* DONATIONS AND BEQUESTS.

Philately. In 1949 the stamp-issuing countries of the world celebrated the 75th anniversary of the formation of the Universal Postal union with a total of about 300 new stamps.

New Issues.—Most of the new issues of 1949 in the United States were primarily for postal purposes—largely because of a new policy whereby the post office became the authority for new issues. Besides three air-mail values in the U.P.U. commemorative set (10 cents, 15 cents and 25 cents), several other air mails were issued, including a new six-cent value to replace the old five-cent, and two commemorative air-mail six-cent values. One of the latter marked the founding of Alexandria, Va., in 1749; the other the anniversary of the first flight of the Wright brothers at Kitty Hawk, N.C. Other commemoratives included a centenary stamp for Minnesota, a stamp for the 200th anniversary of the founding of Washington and Lee university, Lexington, Va., a stamp to commemorate the first gubernatorial elections in Puerto Rico, a commemorative for the centenary of the death of Edgar Allen Poe, in the format of the writers series of a few years back, one for the tercentenary of the founding of Annapolis, Md., and a commemorative for the final encampment of the Grand Army of the Republic.

Bermuda issued a series of three stamps to commemorate the centenary of the first stamp, a postmaster's provisional, issued there. After a series of stamps in western Germany in each zone and subzone, an agreement to stabilize exchange resulted in the stamps of each state or district being declared legal for postage in all western Germany. Baden issued a stamp with the portrait of Carl Schurz.

Devaluation.—The devaluation of many currencies had little repercussion in stamps. Market prices recessed slightly in current issues for the countries affected, in terms of hard currencies. Some values, in Swiss gold centimes, were no longer valid for the international service for which they were originally designed.

Societies.—In Oct. 1949 the Chicago Philatelic society celebrated its 1,500th consecutive semimonthly meeting. More than 400 members and visitors attended the meeting, which was signalized by a commemorative medal.

The Junior Philatelic society of London, Eng., marked its 50th anniversary in Nov. 1949. From a charter list of 10 members, it had expanded to more than 3,000.

Stamps for the Wounded, a nonprofit, nonsectarian organization of all U.S. stamp collecting organizations sent teams of men and women to hospitals with stamps and materials that had been donated to veterans.

Bibliography.—Volume II of the *Encyclopaedia of British Empire Postage Stamps*, published by Robson Lowe Ltd. appeared, dealing with the stamps of British Africa. The 1950 volumes of the various standard catalogs appeared in 1949. A new printing of Mannel Hahn's *So You're Collecting Stamps* also appeared. (M. Ha.)

Philippines, Republic of the.

This republic situated in the western Pacific ocean east of French Indo-China, comprises an archipelago composed of almost 7,100 islands, totalling 115,600 sq.mi. The population by the census of Oct. 1, 1948, was 19,234,182. The chief city is Manila, the capital, whose metropolitan area held about 1,300,000 persons. Other sizeable cities are Cebu (167,000) and Iloilo (110,000). About 10,000 U.S. citizens and 12,000 occidentals from other countries live in the islands. By official count Chinese number about 140,000, but the actual fullblooded Chinese population exceeds 200,000. Most Filipinos are Catholic in religion (Roman Catholic or native Aglipayan Catholic). In the southern islands live some 800,000 Mohammedans, while about 425,000 Protestants and almost 700,000 pagans are widely scattered.

History.—Politics dominated the stage during the year 1949. Elpidio Quirino, having succeeded Pres. Manuel Roxas upon the latter's death in April 1948, became a candidate for the presidency at the elections in Nov. 1949. Party politics provoked many charges of corruption and dragged up the issue of wartime Japanese collaboration, so that the election campaign was a rough one. Senate president and Liberal party leader José Avelino, ousted from both posts on charges of selling war surplus property, led a rebel wing, President Quirino heading the main party. The strongest opposition came from Nacionalista party candidate José B. Laurel, wartime Japanese puppet president. In the election on Nov. 8, military pressure, violence and disorder resulted in protest concerning nearly one-half the total votes cast. On almost complete returns of Nov. 21 the count stood: Quirino 1,711,448, Laurel 1,282,994, Avelino 399,931. A short-lived rebellion broke out in Batangas, Laurel's home province, after the election. President Quirino's Liberal party won a majority in congress, controlling about 60 of the 100 seats in the house of representatives, and at least 15 out of the 24 seats in the senate. Inauguration of new officials took place on Dec. 30, 1949.

Agrarian Problems.—The Hukbalahap, originally a wartime anti-Japanese guerilla organization, had become dominated by Communists and had militantly espoused the cause of Philippine tenant farmers. The result of 1948 military punitive expeditions against them was to scatter the partisans throughout the mountain country of Luzon. Campaigns during 1949 made little headway toward eliminating the Hukbalahap, though they formed no major internal threat during the year. An unfortunate result of partisan activities was the highway ambush killing, in April 1949, of Mrs. Aurora Quezon, widow of the first Philippine president, Manuel Quezon.

Changes in agrarian legislation during 1947–48 made technically possible the peaceful amelioration of tenant problems, but landlord domination of central Luzon's rice lands prevented effective agrarian adjustment and maintained the basic unrest which could be exploited by the Hukbalahap. Expansion of colonial land settlement projects in the southern Philippines was undertaken during 1949 both to help increase agricultural production and to alleviate Luzon's agrarian problems.

Rehabilitation.—The Philippine bureau of public works, with the co-operation of the United States Public Roads administration, had by the end of 1949 rebuilt and extended the highway system. The United States War Damage commission expected to release about $185,000,000 between July 1949, and June 1950, in partial settlement of major public and private claims. Small claims were paid in full during 1947–48, leaving major claims to be liquidated by annual instalments during the period 1948–51.

Inflationary postwar construction costs prevented full restoration of many prewar buildings, public facilities and industrial plants. Two November typhoons during 1949, taking abnormal southern paths across northern Mindanao, Negros and Palawan Islands, destroyed about 75,000 homes, killed more than 500 people and did millions of dollars damage. However, the steady issue of U.S. funds to private persons and public agencies offset gradually declining price levels and continued to underwrite Philippine reconstruction to a considerable degree.

Finance and Trade.—The wartime destruction of homes, public buildings, factories and capital equipment and the disappearance of consumer goods created tremendous shortages in the Philippines, which were accompanied by greatly decreased productive capacity of raw materials and export commodities. Postwar trade showed an extraordinarily large volume of imports and a decreased volume of exports, in contrast to prewar trade which normally showed a surplus of exports. In 1949, most Philippine trade still was with the United States. Wartime losses had been offset somewhat, furnishing an extremely fluid purchasing strength. This liquid resource was devoted to the import of all types of consumers goods. Though agricultural productivity for home-use crops was above normal, by the end of 1949 the export volumes of sugar, abaca and tobacco had not yet returned to prewar levels. Only coconut products among the standard chief exports, exceeded prewar production. The 1949 annual income approximated $2,250,000,000, compared with about $1,750,000,000 during 1946. During 1947–48 adverse trade balances had reduced financial reserves. Despite import controls set up late in 1948 imports for the first half of 1949 exceeded those for the first half of 1948 and, on Aug. 31, 1949, international currency resources had dropped to $235,000,000. The latter part of 1949 saw increased controls over consumer imports and a still more restricted program was announced for 1950.

The cost of living had been falling steadily, and by Nov. 1949, was down to 339.3 as against a 1941 base of 100. The value of the Philippine peso, against a 1941 base of 100 centavos, had risen by the same date to approximately 44 centavos. In Dec. 1949 the domestic buying rate for U.S. dollars was 2.008 pesos per dollar; the domestic selling rate was 2.010 pesos per dollar.

Agriculture and Industry.—The year 1949 was the first of a five-year program of agricultural expansion and industrial development designed to even the balance of trade and maintain the advance in the standard of living. The 1948–49 rice crop of 2,660,000 short tons was one of the largest ever grown, but still was insufficient to feed the growing population. Increased production of rice, which was already the leading crop was one of the chief aims of the five-year program. Sugar production for the crop year 1948–49 was 728,000 tons, with 27 refineries operating. For the crop year 1949–50 there were expected to be 29 refineries in operation and the yield was estimated at about 830,000 tons, a vital part of the export program. Timber production exceeded the prewar normal during 1949, with a cut of 1,037,000,000 bd.ft., permitting a small export program.

The industrial phase of the new program was concerned with electric power development, the home manufacture of consumer goods, the production of fertilizers and the increased processing of products formerly exported in the raw state. During the year the manufacture of such items as cotton textiles, rubber shoes and clothing, glass, nails, paper, plywood and cement produced about half the prewar volumes. Most of them showed increases during the year as general parts of the program. Further expansion was inhibited by the lack of capital funds. (J. E. Sp.)

Philosophy.

New works displayed a wide range of vigorous intellectual activity in 1949, with emphasis on (1) study of great philosophers, (2) the problem of history, (3) scientific philosophy and the problem of human knowledge, (4) international co-operation among philosophers.

Great men who received scholarly attention represented every period of history. Some hitherto unpublished philosophical lectures of Samuel Taylor Coleridge were printed. A new life of

George Berkeley by H. A. Luce appeared as a companion volume to a projected new edition of Berkeley's works in nine volumes, one of which had been published. Valuable for the study of Immanuel Kant's ethics were two new translations from his writings in this field: *The Critique of Practical Reason and Other Writings in Moral Philosophy,* translated by Lewis White Beck, and *The Moral Law, or Kant's "Groundwork of the Metaphysic of Morals,"* translated by H. J. Paton. Publication in Paris of the works of great French philosophers in a new set of about 50 volumes, *Corpus Général des Philosophes Français,* was begun; the first volume to appear contained the philosophical works of Etienne Bonnot de Condillac. The bicentennial of the birth of Johann Wolfgang von Goethe was celebrated by philosophers along with all men of letters. A large number of books appeared, many of them consisting of selections from Goethe's writings. U.N.E.S.C.O. published a volume of tribute entitled *Goethe. Homage. 1749–1949.* Among other publications were Arnold Bergsträsser's *Goethe's Image of Man and Society,* Jean Boyer's *Pour Connaître. Le Pensée de Goethe,* and C. R. Joy's translation of Albert Schweitzer's *Goethe. Four Studies.* John Dewey published a new book, *Knowing and the Known,* with Arthur F. Bentley as coauthor.

Many-sided Albert Schweitzer increased his already large audience in the English-speaking world with the American publication in a single volume of the first two parts of *The Philosophy of Civilization.* Schweitzer's appearance at the Goethe celebration at Aspen, Colo., was widely noted in America. Among other interpretations of history, culture, and civilization were Karl Löwith's *Meaning in History: The Theological Implications of the Philosophy of History;* Reinhold Niebuhr's *Faith and History: A Comparison of Christian and Modern Views of History;* Huntington Cairns's *Legal Philosophy from Plato to Hegel;* Stringfellow Barr's *The Pilgrimage of Western Man;* and a translation into English of Bertrand de Jouvenel's *On Power: Its Nature and the History of Its Growth.* Diagnosis of the world's political ills, with therapeutic suggestions, occurred in the two several-authored books, *Ideological Differences and World Order,* and *Foundations for World Order.*

The announcement by Albert Einstein in Dec., 1949, that he had succeeded in working out a "generalized theory of gravitation" which would probably bring all known physical phenomena under one concept or law, was as much a philosophic as it was a scientific event. It was fitting that a distinguished volume entitled *Albert Einstein, Philosopher-Scientist* (the seventh volume in "The Library of Living Philosophers" edited by Paul Arthur Schilpp) should have been announced for publication in the same month. Other books of distinction in the philosophy of science were *Philosophy of Mathematics and Natural Science* by Hermann Weyl, *Modern Science and Its Philosophy* by Philipp Frank, *Scientific Autobiography and Other Papers* by Max Planck, *The History of Nature* by C. F. von Weizsäcker, *Natural Philosophy of Cause and Chance* by Max Born, *Studies in Philosophy and Science* by Morris Cohen, *Probability and Induction* by William Kneale, and English translations of *The Theory of Probability* by Hans Reichenbach, and *Philosophy of Nature* by Moritz Schlick. The "science" of *Cybernetics* (communication engineering) was introduced in a book of that title by Norbert Wiener. *Human Knowledge, Its Scope and Limits* by Bertrand Russell, published late in 1948, received widespread critical attention in 1949. In his 76th year Russell explored once more, in a major work of his long and distinguished career, the relation of sensory experience and theoretical knowledge, setting forth five postulates which he had come to regard as the minimum necessary to justify induction.

So numerous were the important books of the year, some of them posthumous, that a further selection of representative titles can only be arbitrary. Some were: *The Philosophy of Ernst Cassirer* (in "The Library of Living Philosophers"), Otis Lee's *Existence and Inquiry,* Whately Carington's *Matter, Mind and Meaning,* Gilbert Ryle's *The Concept of Mind,* Leon Brunschvieg's *La Philosophie de l'Esprit,* and translations into English of L. F. Vinding Kruse's *The Foundation of Human Thought,* Karl Jaspers's *The Perennial Scope of Philosophy,* and Leonard Nelson's *Socratic Method and Critical Philosophy.*

The debate over existentialism flourished. Catholic, Protestant, and atheistic existentialists opposed each other vigorously, while nonexistentialists opposed them all. There were new books on this subject by Gabriel Marcel, Helmut Kuhn, Jean Wahl and a number of others.

International co-operation among philosophers was evidenced in several ways, most notably by the East-West Philosophers' conference at the University of Hawaii, Honolulu. For six weeks Asiatic and American scholars (with one English representative) studied together to improve their understanding of the two great streams of thought. Progress in sympathetic response was reported. The aim was not to try to work toward a single philosophy for the whole world, but to achieve a satisfying degree of unity in diversity. Some success in moving toward this goal was announced. (E. L. Mn.)

Photography. Most of the World War II shortages of photographic equipment were definitely a thing of the past in 1949. Competition had set in, and it was again a consumers' market with many downward price adjustments

LOWER MANHATTAN illuminated by ten photoflash cartridges of 50,000,000 candlepower each, dropped from a B-17 in June 1949 during a U.S.A.F. test of new photographic equipment

among the various manufacturers. There was a big trend toward the use of miniature cameras, especially in combination with the colour films, new lantern slide viewers and projectors. Interest in the amateur and creative field of photography was also accelerated.

More than 67% of all photography in the United States was in the technical and industrial fields by the end of 1949. There were about 15,000 commercial and portrait studios; 4,000 photofinishing plants; 3,500 graphic arts establishments for the printing industry; 55,000 X-ray laboratories; 3,000 industrial photographic departments; 500 motion-picture producing firms; and 600 newspapers with newsphoto laboratories. The United States was exporting cameras and films at a rate of about $60,000,000 a year, or ten times the prewar rate.

Notable among the new applications of photography in the scientific field was autoradiography. By the end of the year more than 7,000 shipments of radioactive isotopes, over a three year period, had been made from the nuclear reactor at Oak Ridge, Tenn., to research workers in the United States and 21 foreign countries. This activity meant many new demands upon photography for recording experiments and progress in this field. George A. Boyd and others in the department of radiation biology, University of Rochester school of medicine and dentistry, Rochester, N.Y., carried on extensive work in autoradiography. In this type of photography, the sensitized film (Nuclear Track Emulsion B made by the Eastman Kodak Co.) is placed in contact with the radioactive isotope and allowed to make the image by prolonged exposure.

International Photographic Industry.—Great progress was made during 1949 in re-establishing international trade in photographic products. Germany was rapidly coming into full prewar production by making more than 78,000 cameras per month during the latter part of the year. About 28,000 of these cameras came from the Agfa Camerawerk, under U.S. administration, and more than 3,000 Leica cameras and about the same number of Rolleiflex cameras came from the western zone of Germany per month. A large part of this production was being exported to the United States.

Agfa Camerawerk introduced a line of new cameras such as the Karat and Isolette, sold in the United States under the names of Karomat 36 and Ventura, respectively. Both were of the miniature type, the Karomat 36 with built-in coupled range finder, using 35-mm. film and the Ventura made for use with film making 2¼ x 2¼-in. negatives.

At the International Trade fair in Utrecht, Netherlands, early in April, photographic equipment from both the east and west zones of Germany was on official display for the first time since World War II outside of Germany. From the Dresden works of Zeiss-Ikon came a newly designed Contax "S" camera. The important change in this 35-mm. miniature camera was in the eye-level reflex focusing method, which replaced the former built-in range finder. New models of the Kine Exakta camera were on exhibition, equipped with Hugo Meyer lenses.

Progress in the Netherlands' photographic industry was shown by products from De Oude Delft Optishe Industrie, with their new telephoto, wide angle and enlarging lenses, and the Philips Co. at Eindhoven. The latter company showed their new PF25N flash bulb, available in three different colour temperatures of 3,400°, 4,000°, and 6,000° K. Philips also had a small hand flash lamp outfit for use with their line of flash lamps. Flash photography was slow in developing on the continent, primarily because of the lack of equipment and supplies.

Franke and Heidecke displayed models of their Rolleiflex cameras. A new Magnar telescopic lens attachment was of interest. This auxilliary lens fitted over the standard 7.5-cm. Rolleiflex lens to give it an effective focal length of 30-cm. A new Rolleiflex was introduced later in the year with such features as a new Compur shutter with built-in flash synchronization, eye-level viewing and focusing, a full-image magnifier and a new carrying case.

Japan made steady progress in getting its photographic industry back into full production. By the end of the year photographic manufacturing had reached 60% of the prewar production. There were 36 important camera manufacturers employing more than 4,500 workers. The camera industry represented about 37% of the optical equipment industry in Japan. Main cameras for export were in the miniature camera class, using 16-mm. and 35-mm. films. Many were almost direct copies of German cameras like the Contax, Leica and Rolleiflex. The Japanese Motoca 35, Leotax Special and Canon Sil were similar to the Leica. Other cameras in the miniature class included the Nikon, Olympus 35, Mamiya 35, Steky, Minion 35 and the 35-mm. Konica. A number of these cameras were finding distribution in the United States.

United States.—A new du Pont Polymer Print film was a notable addition to the field of colour motion-picture photography. This film was designed to be printed from three black-and-white separation negatives and to be developed in colour during a single passage through a slightly modified conventional developing machine. Formerly the emulsion layers for colour-forming development contained at least three components—gelatin, silver halide and colour former. In the printing film worked out by du Pont, only two components were employed—silver halide and a water-sensitive synthetic polymer playing the role of both gelatin and colour former. The colour former is as insoluble as gelatin; water only swells it. When the polymer is swollen by processing solutions, the colour-forming groups, though bound up in a complex polymer molecule, remain highly reactive with the oxidation product of the developer. Colour prints can be made from separation negatives like the type used in technicolor cameras, or made from Kodachrome, Ektachrome or Ansco Color films. The new synthetic polymer base in this film has constant chemical properties, while the usual type of gelatin varies from batch to batch, requiring great care in film manufacture.

Du Pont also brought out a new cut sheet film for still photography, known as High Speed Pan Type 428 with an A.S.A. rating of 160 daylight and 115 tungsten. Ansco duplicating colour stock, type 232, was in production and being delivered to Hollywood.

A gigantic photographic map of the universe was in preparation at Palomar mountain during 1949 with the giant Schmidt telescope. This project was the joint work of the California Institute of Technology, Pasadena, Calif., and the National Geographic society.

Rolab studios in Sandy Hook, Conn., brought out a new Roger camera timer for time lapse cinematography and animation which consisted of a minute device, hour device, camera motor, frame counter, relay mechanism for intermittent and continuous operation, automatic light-control mechanism and instrument panel. Supplementary equipment included a voltmeter and ammeter for measuring light output, time limit switch, auxiliary light circuit, receptacle for panel work and remote-control button for single exposures and animation work.

Kodak Ektacolor film was made available. This new colour film, first announced in 1947, produces a negative whose colours are complementary to those which will appear in the final print. Ektacolor simplifies the making of colour prints and photomechanical reproductions by eliminating the need for masking and for separation negatives. This film was intended primarily for professional use with artificial light. It can be processed in the photographer's studio.

Kodak Pan Matrix film was also brought out in connection with Ektacolor. This new film permitted positive colour printing matrices to be made directly from Ektacolor transparencies by either contact printing or enlarging through filters without any intermediate steps. A special black-and-white proofing paper for use with Ektacolor film and a special Kodak Vacuum Register board to speed printing with Pan Matrix film were also available.

Kodacolor film, type A was a new colour roll film properly balanced for clear flash and flood illumination. No filters were required for its use with this type of lighting indoors. This film has the same emulsion speed as regular Kodacolor film. It is of the colour coupler type and has a wide colour-reproduction latitude.

A new Kodalith Blue-Sensitive film for the graphic arts was available. The new film, with no antihalation backing, was specifically made for those who want to reverse an image by exposure through the back of the film. The general characteristics of the new film were somewhat similar to Kodalith Ortho film, type II, except that the newer film was not an orthochromatic emulsion.

There was also a new Kodak Commercial Thin Base film for use in gravure printing and layout work where an extremely thin-based film is desirable for making continuous tone negatives or positives. Another sensitized product from this firm was Kodak Opal K paper, giving a bright lustre and rich full range.

A new model of the Kodak Tourist camera incorporating a radically new between-the-lens shutter with an accurate top speed of 1/800 sec. made it the world's fastest shutter of its type, with the widest speed range in the folding camera field. To attain this exposure speed the blades in the new shutter pivot and rotate through a partial circle inside the shutter housing. As the rotation progresses, the shutter aperture is opened and then closed. There is also a built-in flash synchronizer in this shutter.

The Kodak Reflex II camera was a new twin-lens reflex camera equipped with the new plastic Kodak Ektalite Field lens in the viewing system. The insertion of this flat, grooved lens beneath the camera's ground glass increased the over-all illumination on the ground glass 250% and corner and edge illumination by 1,000%. Critical focusing is speeded and made easier and composition is simplified because of the more brilliant image. A new automatic film stop was also incorporated into the camera.

The Eastman Kodak Co. brought out the new low-cost Kodak Pony 828 camera, producing eight pictures from each roll of film. There was also a new 8-mm. roll loading camera for home movie makers, known as the Cine-Kodak Reliant camera, and the new Kodascope Eight-71 projector equipped with a lumenized one-inch f/1.6 Kodak Ektanon Projection lens and a 750 or 1,000-w. lamp. Kodak also introduced a new Brownie Hawkeye camera to make twelve 2¼ x 2¼-in. negatives.

Compared with previous years there was not very much new equipment for the darkroom worker. However the Kodak Flurolite enlarger and the Kodak Hobbyist enlarger were important exceptions. The main feature of these enlargers was the integrating-sphere type of lamp house which combined the best features of the condenser type and diffusion type enlargers. The enlargers accommodate negatives up to 2¼ x 3¼ in. The Flurolite is a more versatile enlarger with many attachments while the Hobbyist is a more simple design to be sold at a lower price.

In the field of high-speed photography the new Kodatron Color Speedlamp was of importance. This new model had approximately 20 times the light output of the former Kodatron Studio model. The power output ranged from 1,000-w.-sec. with one power unit and one condenser to 2,736-w.-sec. with one power unit and three condensers.

Below: "Don't you think that the superiority of modern art is based on the fact that, by retreating into the realm of irreality, it invades the libido sphere of the subconscious mind?" Plates from *The Frenchman*, a photo-interview between Fernandel (Fernand Contandin), French comedian, and Philippe Halsman, photographer

A new Graflex 2¼ x 3¼ Century Graphic was produced in the field of miniature press-type cameras. Graflex roll film holders were made for use with the various Graflex cameras. The Super D Graflex single-lens reflex cameras were equipped with a highly specialized Fresnel lens for increasing uniformity as well as intensity of screen illumination in the picture viewing system. A 2¼ x 3¼ Century Graphic camera was made similar in design to the Speed Graphic cameras but without the rear focal plane shutter.

The Polaroid Land camera, introduced at the beginning of 1949, rapidly established itself in the photographic life of the nation. With this camera it was possible to expose and develop a finished picture right in the camera within one minute. By the end of the year nearly 7,000,000 pictures had been taken with these cameras. In addition to the overwhelming majority of cameras used for taking pictures for personal use, many were used in the industrial and business fields where the picture-in-a-minute feature was invaluable for recording purposes.

Stereoscopic photography made steady progress with the Stereo Realist camera and with the new Three Dimension Co.'s Stereo projector which was equipped with Polaroid filters to give unusual stereoscopic effects upon the projection screen.

Bausch and Lomb Optical Co. introduced nine new Animar motion-picture lenses for 8-mm. and 16-mm. photography. There were five standard and four telephotos. The important features of these lenses besides their optical qualities were the spread diaphragm stops for easier readability and the click stops for changing settings without looking at the lens scale. This manufacturer also produced a new series of high-speed projection lenses especially for large motion-picture houses and drive-in theatres, with a speed of f/2.0.

A new Cadet Exposure meter was made by the Weston Electrical Instrument Corp. This meter was designed for simpler operation in the lower price range. It was adapted for use with incident or reflected light readings.

General electric made a new photographic flash tube to operate at speeds of 1/5,000 sec., with an improved triggering circuit for use with lightweight portable power speedlamp units. A new 375-w. photoflood lamp was made with a narrower beam spread which gave more light on the camera subject than the wide-beam 500-w. reflector photoflood lamp. General Electric also produced an extremely powerful photographic floodlight producing light from 7 to 15 times the intensity of sunlight for use with high speed motion-picture work where speeds up to 8,000 pictures per second are required. This lamp produces 75,000 foot-candles of light, as compared with the normal 50-foot-candle level existing in the better indoor lighting systems.

Developments in electron microscopy were not spectacular, though there was a steady stream of new results. In the Radio Corporation of America laboratories at Princeton, N.J., the first quantitative method of testing the symmetry of electron microscope objectives was perfected. A new removable intermediate lens was developed to provide magnifications from 1,000x to 20,000x without changing lenses.

J. H. L. Watson and L. E. Pruess of the Edsel Ford institute succeeded in making some interesting motion pictures of the sublimation of special crystals under the influence of the electron beam in the electron microscope. They did this simply by photographing the fluorescent screen with sensitive film.

Considerable new work was done on the ultra-thin sectioning of tissue. C. E. Hall of the Massachusetts Institute of Technology, Cambridge, Mass., made electron micrographs of crystals made up of molecules of seed globulin. These are the smallest (6 mμ) molecules seen in crystalline form. J. L. Melnick of Yale university, New Haven, Conn., photographed virus-like bodies from human skin papillomas in what appeared to be a crystalline arrangement. In spite of his conservative pronouncements, it was generally accepted that this represented the first demonstration of an animal virus in crystalline form.

The George Eastman House, Inc., a public educational institute to further the knowledge of photography's means, accomplishments and potentialities in every field, was formally opened on Nov. 9 in Rochester, N.Y., with Oscar N. Solbert as director and Beaumont Newhall, curator.

The Museum of Modern Art photography department under the direction of Edward J. Steichen was active with important photographic exhibitions. The large exhibition known as "The Exact Instant" covered the events and faces in news photography during the preceding century. "Roots of Photography" was the next exhibition and included the works of David Octavius Hill, Robert Adamson and Julia Margaret Cameron. Ralph Steiner, Wayne Miller, Tosh Matsumoto and Frederick Sommer had photographs on display representing four phases of contemporary photography in an exhibition called "Realism in Photography." Other exhibitions included pictures to show the roots of French photography and later photographs by Lisette Model, Bill Brandt, Ted Croner and Harry Callahan.

A total of 92 recognized pictorial exhibitions were held throughout the world during 1949, as compared with 88 in 1948. According to the *American Annual*, 3,250 pictorialists exhibited 21,493 photographs, the average salon hanging 234 prints. A remarkable growth in the number of exhibitions devoted to nature photography was noted during the year.

The Progress medal of the Photographic Society of America, highest award in American photography, went to a pictorialist for the first time—J. Dudley Johnston, of London, England, for "inspiring leadership, fostering photographic societies, and absorbing knowledge of photography." Physics. During 1949, while science was still recovering from its exploitation during World War II, considerable advances were made along many lines, notably in microwave physics, in the interpretation of cosmic ray phenomena, in the application of molecular vibrations to the standardization of time intervals, in the cataloguing of the properties of radioactive materials, in low-temperature physics and in the theory of the nucleus. A few special topics described briefly below show the progress made in fundamental physics.

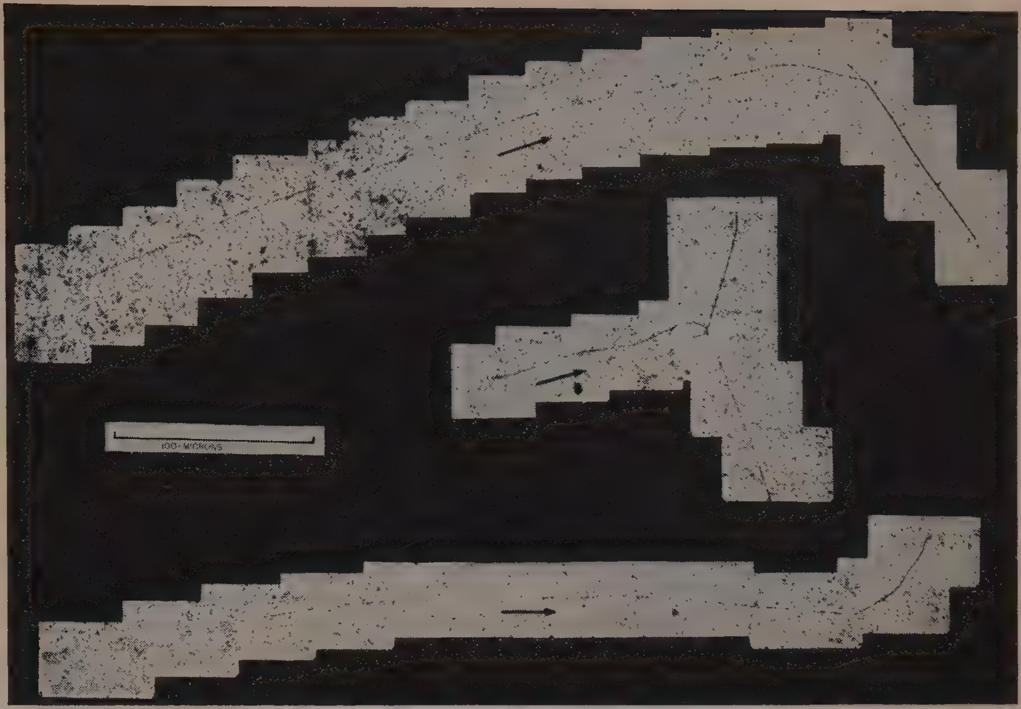
Several important groups of physicists turned their attention to the problem of abstracting the literature of physics. Especially since about 1938, it had become virtually impossible for a physicist to read in full, much less study, all the published papers that interested him, even if all the physics periodicals of the world were accessible. And to a research physicist, not to be abreast of the times was the cardinal sin. It was felt that the problem might be solved by a new abstract service of some kind. Most English-speaking physicists had relied on *Physics Abstracts,* issued monthly in England by the Institution of Electrical Engineers; but judged by modern standards that compilation was believed to have become inadequate in several respects. In order that a practical and acceptable solution of the problem might be reached, the American Institute of Physics, working with the office of naval research, spent the year 1949 in assembling the information necessary for answering questions like the following: How important are abstracts to physicists? How do they try to use the abstracts? What do they think of the abstracts they now have? What kind of abstracts would they like? The results of this study were awaited with interest.

Neutron.—The neutron, an uncharged particle of approximately the same mass as the proton, is a constituent of all atomic nuclei except ordinary hydrogen. The particle is unstable (or radioactive) when liberated into the free state by the breaking of nuclei, but its half-life was known only by theoretical estimate. The half-life had not been measured experimentally for the simple reason that it was impossible for neutrons to be imprisoned within a vessel as atoms of a gas could be. The neutrons, having no electric charge, would escape immediately through the walls of the vessel, no matter of what it was made. Without giving detailed reasons, it may be asserted that the only feasible method of determining directly the half-life of the neutron was by making measurements on a newly born stream of neutrons such as emerges from a nuclear reactor. The experiment would have no chance of success unless the stream of neutrons was very intense. Utilizing the neutron stream, probably the most intense in the world, emerging from the Chalk River (Ontario) nuclear reactor, J. M. Robson was able to measure the intensity of the positive decay protons by a focusing ion-spectrometer. The effect that was measured, and on which the half-life was based, was a proton current that stood out about 30% above the background of the counting devices used. In most experiments in nuclear physics, such a situation would be presumed to lead to fairly reliable numerical results. Robson's final figure was that the half-life of the neutron, as measured directly, lay between 9 and 18 min., in good agreement with theoretical estimates. (For example, in 1947, in the course of a formal lecture, H. A. Bethe estimated the half-life at 20 min.) Independent experiments carried out at the Oak Ridge (Tenn.) laboratories of the Atomic Energy commission, and reported in Nov. 1949, indicated that Robson's result was unlikely to be wrong.



PHOTOMICROGRAPHS of three typical mesons in a photographic emulsion, produced by a 335-Mev X-ray beam from the University of California synchrotron completed at Berkeley in 1949. These are some of the first mesons detected that are known to have been produced by X-rays; arrows show the directions of the tracks. Photomicrographs were useful in showing the identifying characteristics of tracks (the increase of grain density in the emulsion toward the stopping end of the tracks, etc.)

Radioactivity.—The following is quoted from an article by J. H. Webb which appeared in the *Physical Review*, Aug. 1, 1949.

> Following the detonation of the experimental atom bomb at Alamogordo, New Mexico, on July 16, 1945, a radioactive contaminant was encountered in strawboard material used by the Eastman Kodak Company for packaging photographic sensitive films. This paper board was manufactured in a mill situated at Vincennes, Indiana, on the Wabash River. A run of strawboard, produced on August 6, 1945, showed this new and unusual type of radioactive contaminant. X-ray film packed with this board showed fogged spots after about two weeks' exposure.
>
> Measurements of the contaminated spots of strawboard showed no alpha-activity but a fairly strong beta-activity. Absence of alpha-activity ruled out naturally radioactive materials. Measurements of the beta-activity showed a maximum energy of 0.6 Mev. and a half-life of approximately 30 days. Radiochemical studies of the active ash from the strawboard indicated that the material was of the rare earth series. The energy value and half-life of the beta-radiation are compatible with the isotope Ce 141.
>
> All studies point to the conclusion that the radioactive contaminant was an artificially radioactive material which found its way into the mill through the river water. The most likely explanation seems to be that it was a wind-borne fission product derived from the atom-bomb detonation in New Mexico on July 16, 1945.

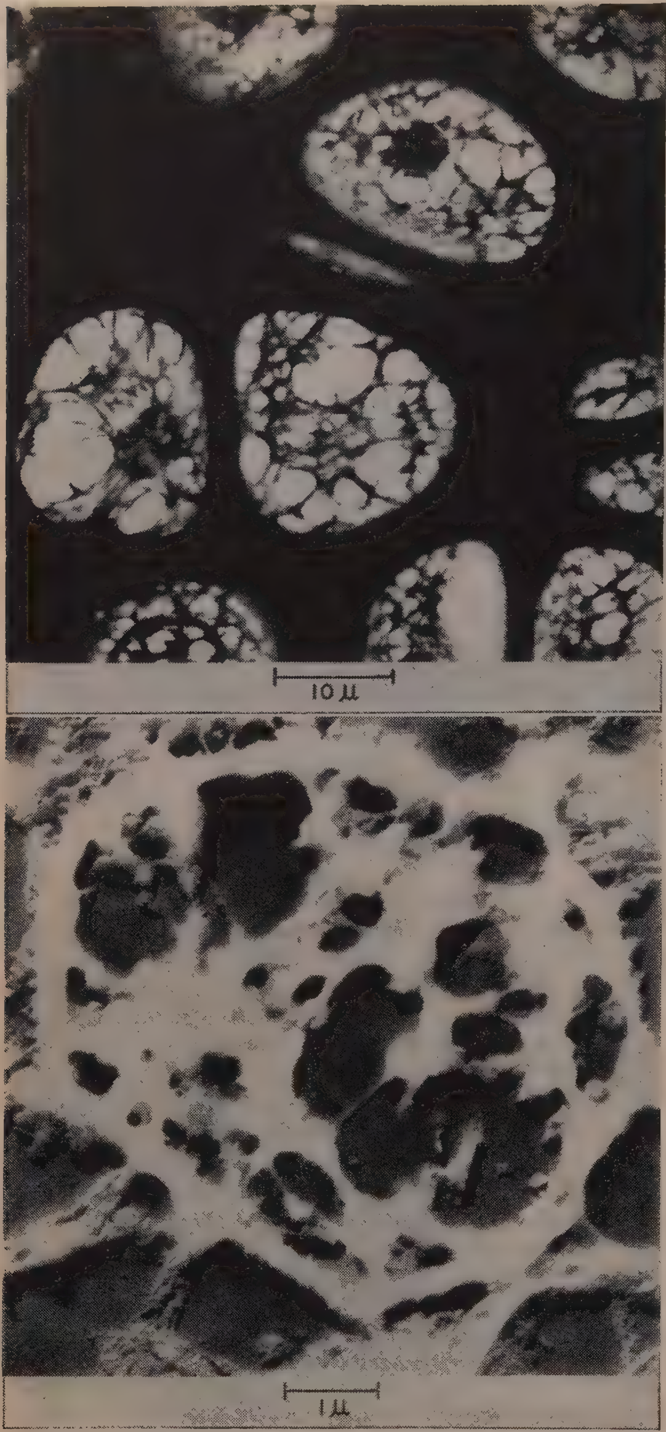
Similar effects were caused by strawboard manufactured in Sept. 1945 at a paper mill in Iowa, several hundred miles from Vincennes, Ind., and on a different watershed. The amounts of radioactive material involved were in all cases exceedingly small, and it was only because the strawboard happened to be used for packaging sensitive photographic film that it was detected at all. Presumably, specks of radioactive dust, perhaps precipitated with rain, were carried down by the rivers and filtered out during the manufacture of the strawboard.

A New Meson.—The photographic methods used in the discovery of new fundamental nuclear particles by C. F. Powell and his colleagues at the University of Bristol, England, since 1946, were adopted in many laboratories throughout the world. Since the examination of photographic emulsions for tracks that proclaim new phenomena is a time-consuming matter, further progress might, for a few years, be expected to be in proportion to the number of investigators engaged in the work. Powell's work established clearly the existence of both π and μ mesons, and the mother-daughter relationship between them. Between 1946 and 1949, a new heavy meson designated by the symbol τ was reported by several workers in the U.S.S.R., in England and in the U.S.

Of these reports, the one supported by the most definite evidence was that of N. Wagner and D. Cooper of the University of Maryland, Baltimore.

The various types of charged mesons are distinguished by the linear densities and the variations of linear densities of developed photographic grains along their tracks, and these differences are interpreted in terms of the different masses and energies of the particles. According to the best recent determinations, π and μ (primary and secondary) mesons have masses 286 and 205 times as great as the electron's mass. The τ meson was found to be much heavier—720 times the electron's mass—but apart from the fact that it might, at the end of its range, be captured by a nucleus which then exploded, or alternatively might end its travel without evidence of being captured, little was learned of its properties. It appeared to originate among the explosion products of a nucleus disintegrated by cosmic-ray action. No family connection of the τ with π and μ mesons was indicated, but if such a connection should exist, its nature might not be determined until an answer had been found to the question whether mesons occur with definite masses or with a continuously variable range of masses.

Terrestrial Magnetism.—To a first approximation, the magnetic qualities of the earth are the same as it would have if it were a "uniformly magnetized sphere." There seems also to be no doubt that the magnetic field that is measured at or near the earth's surface originates from sources inside the earth rather than from any happenings in space outside the earth. The next step in a proper understanding of the earth's magnetism—an explanation of the extent to which the earth's field differs from that of a uniformly magnetized sphere—is, unfortunately, one of tremendous complexity. Measurements have, of course, been made of these differences all over the land and oceans, but a



ELECTRON MICROGRAPHS of specimens prepared by a microsectioning method developed at the national bureau of standards, in 1949, for obtaining very thin sections of biological tissue. Top: cartilage from a frog's eye, magnified 1,500 times; bottom: cell nucleus from a frog's eye near the area of rods and cones (10,400 times)

satisfactory explanation of their patterns has been elusive. Furthermore, the patterns change slightly in a definite but complex manner from year to year.

Some new ideas on the subject were published during 1949 by E. C. Bullard, director-elect of the National Physical laboratory, England. Discarding the idea of any permanent magnetism, he sought to explain the observed phenomena in terms of large-scale electric currents within the liquid metallic core of the earth. In order that the magnetic effects might be reasonably permanent, it had to be assumed that inside the core of the earth the flow of electricity and the flow of material of which the core is composed must be such as to simulate a self-exciting dynamo, so that the flow of charge created the magnetic field across which liquid metal moved only to have more electric currents induced in it. Such a supposition was eminently reasonable, provided that a source of energy available for maintaining the mass-flow could be identified. Bullard suggested that either (1) the liquid core did not follow faithfully the precessional motion of the earth or what was more likely (2) thermal convection currents existed to carry heat from the core outward. The second of these assumptions was partially developed, without serious conflict with established facts, to explain the major part of the earth's magnetic field. Local irregularities in the field and secular changes thereof were then presumed to be the result of two further effects, the occurrence of local eddies in the liquid interior and distortion of the regular field by magnetic materials in the solid crust. Before the theory could be finally accepted, it would be necessary to prove that it was equally applicable to other astronomical bodies such as the sun.

Origin of the Elements.—The known elements are not all equally abundant in that part of the universe that is accessible to scientific observation. Striking regularities in abundances appear side by side with striking irregularities. For example, it has been proved that light elements are more abundant than heavy ones and that there is a gradual change in relative abundance from hydrogen (the lightest element) to the heaviest elements, covering a factor of about 10,000,000,000. At the same time there exist violent fluctuations of abundance from one light element to the next. To illustrate these generalities, it can be asserted that for every atom of gold in the universe, there are 10,000,000,000 atoms of hydrogen, 1,000 atoms of fluorine and 1,000,000 atoms of neon. Since all nuclei are composed of neutrons and protons, it seems clear that these regularities and irregularities of abundances must reflect the manner in which nuclei were originally formed from their constituent elementary parts. The problem was to discover how the elements originated.

M. G. Mayer and E. Teller summarized the existing situation, calling attention to the probability that light elements may have been formed by thermonuclear reactions, in the course of which new nuclei were built by the addition of protons to already existing nuclei. They emphasized strongly the conclusive evidence that, at the time of formation of heavy nuclei, the proportion of neutrons exceeded that which is now found; otherwise, the heaviest isotopes of the heavy elements would not be the most abundant. They then explored the hypothesis that heavy nuclei were formed by the disintegration of a cold nuclear fluid containing a great excess of neutrons. Considering this as a kind of fission and neutron-evaporation process operating on nuclei much heavier than now exist, Mayer and Teller predicted a theoretical distribution of isotopic nuclei in the range of atomic numbers 62 to 78, that agreed remarkably well with actual observations. In deriving this distribution of abundances among the isotopes of each of a series of elements the authors pushed the theory one step farther than it had been carried before.

(*See* also STANDARDS, NATIONAL BUREAU OF.)

Einstein's Unified Field Theory.—Physicists had been for 150 years acquainted with effects separately described as electricity, magnetism, light, gravitation. For example, a thunderstorm was an electrical phenomenon, the pointing of a compass toward the north a magnetic one, the scattering of light was optical, the falling of an apple to the ground was gravitational. When they were first discovered, all four types of effects were unrelated—in different compartments of knowledge. Through the work of Michael Faraday, James Clerk Maxwell and a host of others, the fields of electricity, magnetism and light were brought under one discipline, so that it was known, for example, how the movement of electric charges produces light, or the movement of magnetic fields produces electric currents. Gravitation alone remained isolated, having no apparent connection with electromagnetic or optical phenomena.

Albert Einstein's new "field theory" brought gravitation into the fold, as it were, providing a formal connecting link between gravitational, electromagnetic and optical effects. It was felt that many years might elapse before a point could be found at which his theory could be checked by experiment.

Physiology.

Natural Occurrence of Antithyroid Compounds.—In preceding years more than a dozen vegetables had been shown to be capable of producing goitre in laboratory animals under favourable circumstances. Many chemically pure substances have this property, and compounds containing any of six different radicles or groupings may be effective. The activity of a particular compound may be greater or less in man than in certain species of animals, and may vary with the environmental temperature and other circumstances. Some of these substances are used in medical practice to depress an overactive thyroid. While many such antithyroid compounds may occur in foods, it was still difficult in 1949 to determine their importance in relation to the occurrence of goitre in man.

The thyroid gland concentrates iodine by removing it from the blood which circulates through the gland. Radioactive iodine is similarly concentrated and its concentration in the thyroid can be shown by placing a Geiger-Müller counter over the gland and making serial counts of the gamma radiation. The rate of concentration of radioactive iodine in the normal individual is regular and predictable. When an antithyroid substance, either in a pure form or taken in the form of food, is administered the accumulation rate of radioiodine is slowed or stopped altogether. A series of 61 different foodstuffs were tested, and the yellow turnip was shown to be actively antithyroid. The active principle of natural antithyroid compounds in turnips was isolated and proved to be L-5-vinyl-2 thio-oxazolidone; its structure was established by synthesis. It has about the same activity as thio-uracil in man. While it occurs in the seeds of other Brassica it was not obtained from the edible portions of cabbage, kale, broccoli or cauliflower. It apparently occurs in a combined form in parts of the plant, and boiling may prevent its liberation. Rape-seed goitre is probably due to this compound. It may be responsible for the goitre of sheep fed on turnips and possibly for a late epidemic of goitre in western Europe among the people who had to subsist largely on Brassica vegetables.

Intravenous Infusions of a Combined Fat Emulsion into Human Subjects.—A 10% combined fat emulsion with a potency of approximately 1,300 cal. per litre was infused intravenously into 76 human subjects. A total of more than 250 litres was injected during the test; five patients received two litres of the emulsion during one infusion period instead of one. The constituents of the emulsion, which must be sterile and thoroughly homogenized, are solutions of protein hydrolysate, glucose, gelatin and refined coconut oil. The particle size was less than one micron. This precaution was taken to prevent pulmonary embolism which could result if the fat particles were too large to pass through the capillaries of the lungs.

Chills occurred with 9% of all infusions, the majority of which came concomitantly with a high-temperature reaction. This was the severest reaction encountered. The blood pressure generally rose during the infusion, followed by a moderate fall which persisted for two hours. The haemoglobin, haematocrit, red and white cells tended to fall below their initial values during the course of the infusion, returning to their initial values near the termination of the infusion. Counts were made of the tiny fat particles (chylomicrons) in the venous blood. The average counts rose from below 10 to over 350, reaching a peak near the mid-point of the infusion, which usually lasted several hours since the rate of the infusion was 20 to 80 drops per minute.

Microchemical determinations of the blood lipids showed a rapid rise and an equally rapid fall to normal limits within two hours after the infusion was completed. Other follow-up studies of the lungs, kidneys and liver did not indicate any serious toxic effects or late effects ascribable to the emulsion.

Measurement of Output of Individual Sweat Glands and Their Response to Stimulation.—The quantity of sweat produced depends on the output of the individual sweat gland and the number of glands actively secreting. The latter was determined by the iodine-starch-paper technique. Tincture of iodine was painted on the skin and allowed to dry; a piece of paper containing starch (such as white bond paper) was then applied to the skin for a short period of time. A dark spot appeared on the paper for each secreting sweat gland, presumably caused by the reaction between iodine and starch in the presence of moisture. The number of glands producing sweat in a given area and for a given time interval could be determined. The amount of sweat secreted was measured simultaneously in an adjacent area of the skin by the capsule method. A small metal capsule containing calcium chloride and absorbent paper was thoroughly dried, covered and weighed on a precision balance. The cover was taken off, the capsule inverted over the skin and taped down for the test period. Then the capsule was removed, the cover replaced and again weighed. The gain in weight was due to moisture collected in the capsule.

This research showed that the number of actively secreting glands was greatest on the back of the hand, less on the forearm and least on the arm. In the lower extremity the order was back of the foot, leg and thigh. The average output per gland per minute in a warm environment varied from .0021 to .0043 mg. Sweating responses were determined in the upper extremity while the feet and legs did a measured amount of work. This increased both the number of actively secreting glands and their total output. Mecholyl introduced into the skin by electric current (iontophoresis) increased still further the number of secreting glands and the average output per gland. Sitting in hot water caused increased sweating of the upper extremity. The results indicated that the first response of the sweating mechanism was to increase the number of functioning glands but if this is insufficient there follows an increase in the output of the individual glands.

Respiration in the Newborn Infant.—Proper treatment of respiratory insufficiencies occurring in the infant depends upon a knowledge of its respiratory exchanges. K. W. Cross developed a plethysmographic method in which the child lies comfortably in a closed compartment with its face protruding, so that it can breathe room air. To produce an airtight seal between the compartment and the child's head he copied a helmet used by the Japanese navy in World War II; it was a pneumatic cuff which when inflated framed the face. An ink-writing volume recorder was connected to the plethysmograph. Air moved into and out of the volume recorder with each change in the size of the chest.

The study was made on 26 normal babies under two weeks of age. The average rate was 28.6 (S.D. 5.2) respirations per minute. The average minute volume was 589 c.c. per minute. Evidence was obtained that there is a positive relationship between the weight of the infant and the volume of air breathed per minute.

Pieck, Wilhelm (1876–), German politician, was born at Guben, Brandenburg, Jan. 3. In 1905 he became secretary of the International Socialists in Bremen, where he was associated with Karl (Sobelsohn) Radek, the Communist writer. In 1906 Pieck was elected to the Bremen city parliament. He went to Berlin in 1907. During World War I he was arrested for illegal antiwar activity, and was sent to the front and finally to a punishment company. He deserted and escaped to Holland where he edited an antiwar paper, which circulated secretly in Germany. In Oct. 1918 Pieck returned to Berlin and played a leading part in the revolution. A 14-year period of political legality in the Prussian diet, the Prussian state council and the *reichstag* followed. Pieck organized the *Rote Hilfe* (Red Aid) for imprisoned Communist party members. After a short arrest in 1933 following the *reichstag* fire he fled to Moscow where he remained for 12 years. After his return to Germany in 1945 he assumed leadership of the Communist party and became chairman of the Socialist Unity party, the new amalgamation of the Communist party with extreme left Social Democrats. On Oct. 11, 1949, he was elected president of the Communist-dominated German Democratic republic in the soviet zone of Germany. (D. A. Sn.)

Pittsburgh. Business activity in the Pittsburgh district in 1949—production, trade and shipments—was 160% of the 1935–39 average, or about 14% less than in the preceding year. Industrial production was marked by a decline of 17%, in part reflecting prolonged strikes in the steel and coal industries. Steel operations were at 77.7% of capacity, down 17%, while coal production was 32% less than in 1948.

The number of persons employed in the first 11 months was reported by the Bureau of Business Research of the University of Pittsburgh at 113.1% of the 1939 average, or 10% less than in the corresponding period of 1948. Pay rolls were down 8%. Department store sales in the first 11 months declined 8%.

Progress was made on public and private building programs designed to change fundamentally the central business district. Land acquisition was completed for a park at the confluence of the Monongahela and Allegheny rivers. The Urban Redevelopment authority joined with a life insurance company in plans for three 20-story office buildings on 23 ac. adjoining the park. Ground was broken for a 40-story office building for the Mellon National Bank and Trust company and the United States Steel corporation. Three Mellon foundations made grants to the city totalling $4,000,000 to acquire and landscape as a park a block in the heart of the business district. Beneath it five floors of parking facilities, it was announced, would be built by the Pittsburgh Parking authority. The authority designated four other areas for public-parking garages to accommodate approximately 2,000 cars, to be built in 1950.

On the south side the urban Redevelopment authority announced plans for acquiring 165 ac. and making extensive changes in street patterns and land use. This development was to be accompanied by a multimillion dollar expansion by Jones and Laughlin Steel corporation.

Progress continued on highway improvements at the eastern approach to the city. Ground was broken for the western extension of the Pennsylvania Turnpike to the Ohio line.

The W. L. and May T. Mellon foundation made a grant of $6,000,000 to build and endow a graduate school of industrial administration at Carnegie Institute of Technology.

The city's population was estimated to have passed the 700,000 mark and that of Allegheny county to be 1,500,000, moderate increases since 1940. The U.S. census bureau fixed the Pittsburgh metropolitan area as including four counties of 3,053 sq.mi., with a population of 2,082,556. Taxable real estate in the county was $2,067,000,000, in Pittsburgh $981,082,764.

David L. Lawrence was re-elected mayor and Democratic candidates carried other local offices. (C. F. Ls.)

Pius XII (1876–), the 262nd successor of St. Peter in the see of Rome, was elected by the cardinals in conclave on his 63rd birthday, March 2, 1939, and was crowned as pope on March 12. (For details of his early life, see *Encyclopædia Britannica.*)

In 1949, in an allocution addressed to the secret consistory of the College of Cardinals, the pope declared the object of the trial of Joseph Cardinal Mindszenty was to disrupt the Catholic Church in Hungary and branded as completely false the assertion made in the course of the trial that the whole question at issue was that the apostolic see, in furtherance of a plan for political domination of nations, gave instruction to oppose the republic of Hungary and its rulers.

In a speech to delegates of the International Catholic Employers association, Pope Pius urged closer collaboration between management and labour. He told employers that "workers should be assigned a fair share of responsibility in the development of the national economy" and urged them to adopt an enlightened social policy in the interest of collectivity as a whole. He urged Belgian workers, who made a pilgrimage to Castel Gandolfo in September, to draft a "statute of public law and economic life." This was suggested because of the temptation to misuse the power of labour unions. He made it clear that labour unions had the blessing of the church provided they seek to "promote the Christian order in the labour world." A group of visiting businessmen were told by the pope the Catholic Church approved of nationalization of industry within certain limits. He said the mission of public rights was to serve the private rights, not to absorb them and that the national economy is not by nature an institution of the state.

On July 13 the Congregation of the Holy Office, headed by the pope, issued a decree against communism. It excommunicated all those defending and spreading the materialistic and anti-Christian doctrine of the Communists. Anyone who "knowingly and freely" enlisted in or supported the Communist party and read, or wrote, in any publication in support of Communist doctrine or activity was to be barred from the sacraments.

Roman Catholic jurists throughout the world were called upon by Pope Pius, speaking to the central committee of the Union of Catholic Lawyers, to abstain from passing sentences based on laws that the church considered unjust. In discussing divorce, the pope said: "The Catholic judge cannot pronounce, unless for motives of great moment, a decision of civil divorce (where it does exist) in a marriage valid before God and the church."

In speaking to members of the United States senate military appropriations subcommittee on Nov. 17, Pope Pius advocated rearmament, making a very careful distinction between force as an instrument for the enslavement of peoples and force as a means to resist aggression.

In his Christmas message the pope called upon all Protestant Churches to "return to the unity of Rome" and urged all Christians as well as Jews to support the Roman Catholic Church in the creation of a united front against militant atheism.

One encyclical was issued demanding internationalization of Jerusalem, freedom of education and worship for religious institutions and freedom of access for Catholic pilgrims in the new state.

On March 12, 1949, Pope Pius celebrated the tenth anniversary of his coronation as head of the Catholic Church. (*See* also Roman Catholic Church; Vatican City State.)

(J. LaF.)

Plague, Bubonic and Pneumonic.

Progress in the control of epidemics of plague, and in protection against this infection was reflected in the recommendations of 20 specialists who conferred in Washington, D.C., in Oct. 1948, and at a sanitary convention at Paris in November. They decided that search for previously unrecognized zones of enzootics should be continued; and, because of the widely spread use and efficacy of insecticides such as DDT (dichloro-diphenyl-trichlorethane) international prophylactic procedures could be reduced. They recommended a more intense comparative study of the relative values of immunizing vaccines prepared from killed bacilli or from live organisms; and the designation of laboratories of world-wide distribution for the conservation and supplying of strains of bacilli of tested antigenic value; and suggested preconizing prophylactic treatment with sulfamides, or with streptomycin in cases of pneumonic plague particularly, with the belief that such measures would at least reduce the period of observation of contacts.

Though there were no epidemics of large proportions registered during 1949, plague continued to smoulder on; cases were reported in Asia, including sections or provinces of Burma, China, India, Indo-China, Java and Thailand; in Africa, including Belgian Congo, Cape Colony, Madagascar, Orange Free State, Rhodesia, Tanganyika; in the Azores; in South America, including Brazil, Peru, Venezuela; in the United States, where two cases occurred in the state of New Mexico for the first time.

A resurvey was made of the extent and persistence of the infection among the field rodents of western United States by examination of fleas collected from rodents which were shot or trapped, or from their burrows and nests whether in use or deserted. The results of the investigation indicate that the enzootic had persisted or recurred over periods as long as ten years. Infected fleas were found in counties of midwestern states, which might indicate an extension of the enzootic zone eastward to more populous areas.

The longevity of *Pasteurella pestis* under favourable conditions may be of practical significance through its transportation in fleas hidden in cargo. Under suitable laboratory environment it will remain viable and retain its virulence over years. A set of 40 slope cultures of virulent bacilli was made on beef infusion agar in 1923. The tubes were stoppered with corks coated with a mixture of paraffin and vaseline and stored at temperatures of from 5° to 10° C. Subcultures were made in 1943, and from 33 of the originals growth was luxuriant. Twenty-five per cent of the originals were alive in 1948, and inocula made from their subcultures produced febrile reactions in guinea pigs. Three of these which died contained lesions typical of acute plague with bacilli in spleen and buboes. The reactions of the subcultures in carbohydrate media were the same as those of the originals.

Fleas infected with a virulent strain of *P. pestis* were stored *in vacuo*. Lots were removed from time to time, crushed, suspended in saline solution and injected subcutaneously into guinea pigs. The animals developed fever whose course was similar to that of the controls and died within three to four days. The tests were positive after storage of from 12 to 941 days, but were negative after 986 days.

With the extension in ship quarantine practices of the use of sodium fluoracetate (1080) as a poison by ingestion for the destruction of rats, or in other deratization measures, the question arose of the likelihood of invalidating the diagnosis of plague in rats presumably poisoned and found dead. The diagnostic procedure is that of reproducing the disease in guinea pigs by injecting them subcutaneously with a saline suspension of triturated bits of the liver and spleen of the suspected rat. The poison is so potent that it seemed enough might be carried over to the guinea pig to sicken or to kill it; or the poison might have a bacteriostatic effect on the bacillus. A preliminary test was made with rats found dead after the use of the poison (1080) on ships. Guinea pigs injected with the suspensions of rat liver and spleen remained well, but others injected with the stomach contents of the rats developed convulsions within an hour and died. A guinea pig which was inoculated with a virulent culture of *P. pestis* became febrile in two days with manifestations of plague. It was then poisoned by feeding it 1080. Thirty-five minutes later it developed convulsions and died. Upon autopsy it exhibited lesions of acute plague which were proved out by subsequent animal inoculation and by cultural methods. Tests in vitro of the poison revealed no bacteriostatic action on growth of the bacillus in cultures.

The procedures in practice for the limitation of human infection and for the control of epidemics in endemic areas continued to be those of destruction of the local rodents and their fleas; these measures had been effective if accomplished with thoroughness over prolonged periods. Such widespread programs were impracticable in large sections of the world, however, and the prophylactic inoculation of people with plague vaccines became regarded as the best preventive measure practicable. An experience in Africa, described in 1949, exemplified this opinion. In an endemic focus on the west watershed of Lake Albert, extending 100 km. parallel to its border in a zone of 40 km. width, primitive methods of deratization had been practised for ten years without diminution of the rodent population, although only one rodent species, *Mastomys coucha*, prevailed, and 3,000,000 had been killed. These measures were supplemented by the administration of 500,000 vaccinations over the years 1939–46. During this period (1940–46), 132 cases of plague were registered. Sixteen of these occurred among those who had received the vaccine (E.V. of Girard and Robic) three months to six years previously, and 116 were among the nonvaccinated.

The prophylactic value of any vaccine is challenged by the virulence of the organism against whose invasion the protection is designed. The determination of virulence is usually accomplished by repeated, painstaking, comparative laboratory tests on animals. It is evident that simpler tests are desirable either to replace or to curtail supplementarily this costly method, and experimentation was directed in 1949 toward the discovery and measurement of some chemical reaction of *P. pestis* which is allied to its virulence. This seemed to have been accomplished by the measurement of its catalase activity, which was determined by its ability to decompose hydrogen peroxide. The mean amount of decomposition which occurred among 14 strains of variable degree of virulence to mice was as 16.3, to 5.1 among

11 avirulent strains.

Plastics Industry. Consumption of U.S. plastics materials of all kinds in 1949 increased more than 50% over 1946, the first postwar year in which relatively exact figures for the industry were available. While the figures are subject to individual interpretation and to various methods of compilation, Table I gives a working comparison.

Table I.—*Plastic Materials Consumption in Pounds*

(Includes filler for all moulding, extrusion, film and sheeting materials. Other items such as adhesives and laminating varnish based on solid resin only. No protective coatings included except a small amount of vinyl)

	1946 Consumption and shipments	1949 Sales
Cellulose Products acetate and cellulose acetate butyrate	103,000,000	76,000,000
Nitrocellulose plastics	18,100,000	7,100,000
Other cellulosics	12,100,000	8,000,000
Phenolics	242,300,000	232,100,000
Urea and melamine*	58,200,000	112,000,000
Styrene and styrene derivative polymers and copolymers	66,800,000	203,000,000
Vinyl compounds†	167,000,000	360,000,000
Miscellaneous moulding‡	50,000,000	39,000,000
Miscellaneous for other purposes, except protective coatings	35,700,000	152,000,000§
Totals	753,200,000	1,189,200,000

*Urea and melamine moulding powder was included in miscellaneous moulding materials until 1949 when it was moved into the figures classified under ureas.

†Includes vinyl chloride, acetate, formal, alcohol, vinylidene chloride compounds.

‡Includes acrylic, polyethylene, nylon and other miscellaneous materials. No casein ncluded.

§This 1949 figure includes acrylic sheet, alkyd, coumarone indene, petroleum, silicone and other miscellaneous. About 70,000,000 lb. of it is coumarone indene and petroleum resins which were not included in the 1946 figures.

Production of the moulding and extrusion branch of the industry had increased more than fourfold since 1940, as shown in Table II.

The number and increasing size of injection presses and extruding machines sold in 1949 indicated that processors expected that branch of the industry to continue its expansion rate.

Phenolics.—Consumption and sales of phenolics rose rapidly to around 15,000,000 lb. monthly during the late fall months of 1949. One of the most obvious reasons for this increase was the moulding of larger pieces. Television cabinets were the most widely publicized of the new big pieces, but of the approximately 2,500,000 television sets produced in 1949, only a relatively small number were enclosed in phenolic cabinets.

Another possibility in developing increased use for phenolic moulding powder was in combination with rubber, although progress had been disappointingly slow. The largest volume of this material was in moulded shoe soles made from nitrile (Buna N) rubber and phenolic. GR-S and natural rubber were also used in combination with phenolic for the same purpose to produce a less costly but not quite so good sole. Another formula using 70 parts resin, 30 parts Buna N and 100 parts filler without any addition of sulphur, curing in 5 to 10 min., gave a material similar to ebonite, a natural rubber compound taking 30 to 60 min. to cure. Other compounds of the rubber-resin mixture were being used for the shanks of tools, connector plugs, grommets with undercuts and floor tile.

Table II.—*Production of Moulding and Extrusion Material in Pounds, Various Years, Compared with Sales in 1949*

(Includes filler)

	1940	1946	1947	1949
Phenolic	80,000,000	140,000,000	194,000,000	120,000,000
Urea and melamine	18,000,000	35,000,000	35,000,000	42,000,000
Thermosetting total	98,000,000	175,000,000	229,000,000	162,000,000
Acetate and butyrate	16,000,000	83,000,000	59,000,000	57,000,000
Other cellulose plastics	17,000	12,000,000	3,000,000	8,000,000
Polystyrene	1,800,000	67,000,000	95,000,000	178,000,000
Vinyl (includes saran)	1,000,000	62,000,000	73,000,000	82,000,000
Miscellaneous	1,500,000	15,000,000	26,000,000	39,000,000
Thermoplastic total	20,317,000	239,000,000	256,000,000	364,000,000
Totals	118,317,000	414,000,000	485,000,000	526,000,000

Source—U.S. census bureau; U.S. tariff commission; *Modern Plastics* estimates.

Vinyl.—Vinyl chloride and vinyl chloride copolymer resin compounds led all other plastics production with a 1949 volume in the neighbourhood of 300,000,000 lb., as compared with only 1,000,000 lb. in 1941.

The biggest outlet for vinyl in 1949 continued to be film for drapes and curtains, raincoats, shower curtains, tablecloths, chair cushions, aprons, nursery items and protective coverings for items ranging from typewriters to autos in transit to butcher aprons. Another fast-growing outlet was for inflatable products ranging from toys to mattresses.

The moulding and extrusion division of the vinyl industry in 1949 ran ahead of 1948 in volume, with wire and cable covering accounting for about 60% or 40,000,000 lb. out of a total of nearly 70,000,000. Next largest extruded product was garden hose, with about 50,000,000 ft. requiring about 6,000,000 lb. of resin.

Polystyrene.—Polystyrene moulding powder sales rose from 66,000,000 lb. in 1946 to nearly 180,000,000 lb. in 1949, and were nearly 20,000,000 lb. monthly in some of the later months of 1949.

New uses for styrene monomer were constantly being discovered (a new water paint was a good example) so that adequate supply was questionable. The limiting factor was benzol, with total production capacity of not much more than 170,000,000 gal. The uses for benzol were so varied and so great that a prolonged upsurge in demand for synthetic rubber, polystyrene, phenol or several other products of a benzenoid nature could create scarcities of serious dimensions.

The principal outlets for polystyrene moulded products remained about the same as in 1948: housewares and hardware, refrigerator and other industrial parts and toys.

Improved moulding technique provided only part of the explanation for the advances made by polystyrene. Without altering physical properties, producers were able to formulate better compounds by employing improved compounding methods and adding new types of lubricants. Higher heat resistance and greater clarity broadened the range of polystyrene applications. Better colouring methods plus the addition of metallic shades added to sales appeal.

Cellulosics.—Approximately 60,000,000 lb. of cellulose acetate were sold in 1949, as compared with the 80,000,000 lb. record for 1946. Flame-resistant acetate which, because of its high impact strength, was particularly adaptable for housings of electrical appliances came into wide use. Christmas tree light and ornament manufacturers adopted it as a safe material for their use. A higher heat-resistant acetate was developed which could withstand numerous boilings without undue distortion. Acetate also found increased use in toys, kitchenware, cutlery handles and toilet seats.

Cellulose acetate butyrate, propionate and ethyl cellulose did not show much change in 1949 over 1948.

Ethyl cellulose moulding powder continued to be used in specialty applications such as tool handles, toilet seats and vacuum cleaner parts.

Production of cellulose propionate, Forticel, remained small in 1949. So far, it had been used most widely for fountain pens

INFLATABLE PLASTIC BOATS, a vinylite novelty marketed in 1949

and telephone handsets and bases.

Cellulose acetate butyrate continued to be the most widely used of higher cost cellulosics. Extruded one-eighth-inch sheet moved more prominently into the field for spectacle frames and sun glasses, toys, soap boxes and other telescoping boxes and similar applications where stability was a prime requirement.

Urea and Melamine.—Consumption of melamine resin increased from 17,000,000 lb. in 1947 to 24,000,000 lb. in 1948, with a jump of unknown quantity in 1949; but since melamine moulding powder for dishware alone was used at a rate of several hundred thousand pounds in 1949, the increase was undoubtedly substantial. Urea moulding powder sales were about 35,000,000 lb. in 1949, a figure that had not changed much since the war. Buttons continued as the largest single outlet, about 30% of the total moulding powder volume. Urea closures and jar caps, particularly for cosmetics, were next largest.

There had been great improvement in urea moulding material. The improved powder was of more uniform bulk and granulation so that there was less scrap loss, fewer rejects and less difficulty in changing from batch to batch. Also, compounds had been developed to save up to 25% in curing time.

Urea and melamine glues declined in 1949, largely because of a decline in furniture production. Use of urea and melamine for paper and textile treatment continued to advance steadily.

Saran.—The biggest use of saran monofilament in 1949 was for woven automobile seat covers. Woven saran upholstery material was also under test as upholstery for seats in buses, railroad cars, original upholstery in passenger autos, public seating for both indoors and outdoors and home and hotel furniture. Other new uses, many of which were going through use tests, were bristles for brushes, radio grilles, women's shoe uppers, narrow webbing for furniture and belts, tobacco cloth, filter cloth and for mixing with other fibres to use in heavy drapes.

Polyethylene.—About 31,000,000 lb. of polyethylene were produced in 1949 and used in a variety of applications ranging from disposable baby bottles and lollipop sticks to heavy jacketing for telephone cable.

Electrical uses for polyethylene were still taking a large quantity of the output for such purposes as insulation in high-frequency wiring, coaxial cable spacers, lead-in wires, jacketing for telephone cable, oil burner and neon sign cables, an electrical tape for splicing and similar applications.

Acrylics.—Although there was considerable improvement in acrylic moulding powders and a reduction in prices there was no gain in over-all volume. The industry had developed three types of acrylic resin with varying properties to use where each was best fitted. First was a higher heat resistant material to withstand a heat distortion point of approximately 190° F. Next, a medium flow material with 174° F. heat distortion point and a soft flow material with a heat distortion point of 151° F. The third new addition to acrylics was red fluorescent material with decided improvement in resistance to fading and loss of fluorescence.

Chief outlet for acrylic moulding powder was still automotive parts—lenses, escutcheons, horn buttons and ornamentation. Moulded letters from two inches to two feet in height for outdoor signs were also thoroughly tested in 1949. Moulded boxes, containers, jewellery and cast display blocks containing embedments of all sorts continued to take the usual amount of acrylic.

Nylon.—Wire coated with nylon had innumerable uses, particularly because of the plastics' resistance to abrasion and fungus as well as heat resistance.

The use of nylon as a monofilament for brush bristles, fishing leaders and sutures was well established and growing. About 92% of all toothbrushes were now nylon bristle and practically all hairbrushes were nylon.

Nylon was widely used in 1949 for bearings or bushings because of its toughness, ability to operate without lubrication and resistance to corrosion. It was also being used in gears, bearings, shafts and cams and in office equipment. A precision instrument company was using nylon bushings in recording and controlling thermometers, pressure gauges, and the like. Pneumonia.

The year 1949 saw the introduction into general use in the United States of two new and highly effective antibiotics, aureomycin and chloromycetin. Staphylococci, which had become increasingly important as a cause of pneumonia, usually secondary to other types of infections of the lung, were found to be quite sensitive to penicillin during the first few years after that antibiotic became available. As the use of penicillin became widespread, however, increasing proportions of these staphylococci, both from pneumonias and from other sources, were found to be resistant to the action of penicillin. They also readily acquired resistance to the action of streptomycin.

Aureomycin proved to be more or less effective against almost all the bacteria affected by both penicillin and streptomycin, except that it is not nearly as effective as the latter against the causative organisms of tuberculosis. Aureomycin is also highly effective both in experimental animals and in human cases against infections with all of the known varieties of micro-organisms classified as rickettsiae. The most common of the diseases caused by the rickettsiae are the typhus fevers, Rocky Mountain spotted fever and Q fever. The latter is known to be an important cause of an influenzalike infection and a severe type of pneumonia, but any of the other rickettsial infections may be accompanied by extensive pneumonia, which may simulate other types of nonbacterial pneumonias and which reduce the chances of recovery from these infections. Both in experimental animals and in human cases of these rickettsial infections, treatment with aureomycin usually terminated the clinical course of the infections within a matter of 48 to 72 hours, and there were no deaths in adequately treated cases.

Still another group of infections against which aureomycin proved highly effective is caused by micro-organisms which previously had been included among the viruses but were later placed in a separate category. Psittacosis or parrot fever and the related infections sometimes referred to as "ornithosis" and which are acquired from other species of birds usually manifest themselves in the human being primarily as pneumonia. Such pneumonias were found susceptible to treatment with aureomycin.

Finally, the largest groups of cases encountered in schools, in colleges and among hospital personnel and possibly also among the general population are not caused by any of the agents mentioned and are usually referred to as "primary atypical pneumonias" or, loosely, as "virus pneumonias." The cause of these pneumonias had not yet been determined in 1949, but it was assumed to be a filtrable virus. The disease, which had been transmitted from human beings by means of bacteria-free filtrates of sputum from active cases, has a higher morbidity but lower mortality rate than any of the other types of pneumonia already mentioned. Reports from several large clinics in New York, Baltimore, Md., and Boston, Mass., indicated that it is quite promptly terminated by proper treatment with aureomycin. A controlled study carried out in an army hospital in California in which cases treated with aureomycin were alternated with similar cases treated with penicillin indicated that only the aureomycin had a specific effect in curtailing the disease.

Because of the favourable effect of aureomycin in Q fever, psittacosis and in the primary atypical pneumonias and particularly because the latter are generally referred to as "virus pneumonias" and the causative organisms of psittacosis and ornithosis are generally referred to as viruses, aureomycin was frequently considered by laymen in 1949 as being effective against virus diseases in general. Actually, aureomycin proved to be entirely without effect in infections with any of the well established viruses with which it had been possible to work in the laboratory, namely the viruses of encephalitis, mumps and smallpox. What is more important in relation to the pneumonias, aureomycin was found completely ineffective against the influenza virus, at least in experimental infections, and probably also in human infections caused by these viruses. The last statement requires some modification because in actual practice aureomycin proved to be effective in cases of pneumonia complicating influenza. Presumably it either prevented or terminated that aspect of the infection caused by the secondary bacterial invaders and which probably is responsible for the prolongation of the morbidity and for the great mortality of this disease.

Chloromycetin, although chemically distinct from aureomycin and derived from a different species of fungus, proved effective in test tube experiments against essentially the same range of bacteria and other micro-organisms that were affected by aureomycin. There are quantitative differences, however, and most of the bacterial incitants of pneumonia were found somewhat less sensitive to chloromycetin than to aureomycin. Like the latter, however, chloromycetin was highly effective against the various rickettsiae and against psittacosis infections. Clinical reports of the use of chloromycetin were as yet quite few in 1949, but they seemed to indicate that this agent too was effective against pneumonias caused by a large variety of infectious agents. Both of these agents have the common virtue that they are effective when given by mouth, and they are both free of any serious side effects.

Tests were carried out by United States public health service workers on the efficiency of various pasteurization methods in eliminating the Q fever rickettsiae from raw milk known to contain the infectious agent. So far as could be determined by the methods available, milk supplies pasteurized by the high temperature-fast time equipment were rendered free of infections although the same milk in the raw state was shown in each instance to be highly infectious (by guinea pig injections). Pasteurization by the method employing the holding vat without space heater was successful in eliminating rickettsiae from raw milk in only three of four experiments. In one of the four tests with this method, however, evidence of infection of the milk could still be demonstrated after the pasteurization. Of 20 guinea pigs injected with this pasteurized milk, 3 showed evidence of infection. In addition, 3 out of 32 specimens of milk from bottles of vat pasteurized market milk and 1 of 4 specimens of vat pasteurized market cream were found to be infected with Q fever, as shown by the guinea pig tests.

In the course of this study it was found that fresh milk was used without pasteurization in the preparation of butter, although the raw milk was known to contain living Q fever rickettsiae. Tests of the fresh milk, butter and buttermilk made from the infected raw milk all showed that the rickettsiae were still present and capable of infecting guinea pigs. Refrigerated butter was still infectious after 41 days.

In seeking out reservoirs of infection or other spontaneously occurring infections with the Q fever rickettsiae, various species of ticks had been found to harbour this organism. The latest discovery in this respect, of possible interest in the epidemiology of the human disease, was the finding of spontaneous infection of Q fever in some brown dog ticks of the species *Rhipicephalus sanguineus* collected in June 1948 from a dog in Phoenix, Ariz. This discovery was made by workers in the Rocky Mountain laboratory in Hamilton, Mont., where the American Q fever rickettsia was first discovered—also in ticks.

In northern California, human cases were found to be as frequently associated with sheep and goats as with cattle. Study of livestock, however, indicated that infection with Q fever rickettsiae in this region was much more prevalent in sheep (37.9%) and goats (43.6%) epidemiologically linked to human cases than the cattle similarly associated with human infections. Studies of the blood of the general sheep and cattle population, as sampled through animals received at slaughter houses indicated that the extent of infection in this group was small; 3.1% of the cows and calves and 3.5% of the sheep examined gave evidence of previous Q fever infection in their blood. The studies also indicated that sheep and possibly goats are epidemiologically related to human infections. This was further supported by the demonstration of rickettsiae in the milk of these species.

Just how the Q fever infection of man takes place was by no means certain in 1949, but an air-borne spread through dust contaminated with rickettsiae appeared to be the most likely method in certain of the outbreaks studied. In this connection, it was of interest that the Q fever rickettsiae had been recovered from the dust from sheep pens on a ranch where animals were known to be excreting organisms in the milk.

During 1949 Q fever was reported from new areas and under

EAST-WEST HIGHWAY connecting Warsaw with the suburb of Praga across he Vistula river; the road was officially opened in July 1949 and is viewed ere from the entrance to a tunnel forming part of the highway

ew circumstances. The wide distribution of this disease in urope, Africa, Australia and North America was demonstrated. reat Britain was one of the latest areas in which evidence of fever infection had been discovered. In the U.S., several cases f Q fever occurred among laundry employees who presumably cquired their disease from handling soiled towels and other tems from the Rocky Mountain laboratory. An outbreak was eported from Philadelphia, Pa., among workers who handled ool and animal hair in a dusty atmosphere. This was the first eport of Q fever acquired in the eastern United States.

oland. A People's Republic of eastern Europe bounded on the east by the U.S.S.R., on the south by Czechoslovakia, on the west by Germany and on the north by the Baltic sea. Area: (before Sept. 1, 1939) 150,052 sq.mi., (after Aug. 2, 1945) 120,359 sq.mi.—a reduction by one-fifth, the result of the annexation of 68,667 sq.mi. by the U.S.S.R., and of the establishment of a new western frontier along the rivers Oder and Neisse which, together with the partition of East Prussia between Poland and the U.S.S.R., gave Poland an area of 38,974 sq.mi. Pop.: (before Sept. 1, 1939) 35,339,000, (Feb. 14, 1946, census) 23,929,757, (mid-1948, est.) 23,900,000. Chief towns (pop. Sept. 1, 1948, if not otherwise stated): Warsaw, the capital (Sept. 1, 1949) 630,024; Lodź (July 1, 1949) 615,000; Cracow 307,400; Wrocław 299,000; Poznan 297,000; Szczecin (July 1, 1949) 185,000; Gdańsk 164,000; Katowice 163,000. Language: almost exclusively Polish. Religion: overwhelmingly Roman Catholic. President of the republic, Bolesław Bierut; prime minister, Józef Cyrankiewicz.

History.—The year 1949 was marked by the fulfilment of the first three-year plan of economic rehabilitation. In a speech on Nov. 11 before the central committee of the United Workers' (Communist) party, Bolesław Bierut, its chairman, announced that if the 1938 production figures were taken as 100, the index numbers for 1949 were as follows: total value of industrial production 174, industrial output per head of the population 244. For agricultural production Bierut said only that between 1946 and 1949 crops had increased by 62% and livestock by 81%, which, however, when compared with 1938, would mean that crop production per head stood in 1949 at 115 and meat and dairy products at 105.

Bierut was, of course, comparing the production of two different areas. To obtain a clearer picture of Polish achievements in the field of economic rehabilitation it must be remembered that the territorial shift to the west on the whole considerably increased the country's industrial production capacity, except in regard to petroleum, of which three-fourths of the production was lost. In 1938 Poland mined more than 38,000,000 metric tons of bituminous coal; in the formerly German part of Silesia prewar production amounted to 31,000,000 tons; as the total Polish coal production in 1949 was estimated at 72,000,000 tons, the actual increase was 4%. The prewar production of steel was 1,400,000 tons in 1938; in the same year the recovered territories produced 900,000 tons; as Polish production in 1949 was estimated at over 2,200,000 tons the prewar level was reached. Another sign of increased industrial potentiality was the output of electric power: in 1938 Poland produced 3,977,000,000 kw.hr.; its loss in the east amounted to 211,000,000 kw.hr., its gain in the west to 2,609,000,000 kw.hr.; as the actual production in 1948 was 7,512,000,000 kw.hr. the increase achieved was more than 19%.

Agriculturally Poland had lost in the east rather poor areas, while in the west it gained highly developed agricultural lands. But by 1949 production was still lagging behind the 1934–38 averages, the total bread grain production being 79%, of oats 72%, potatoes 88% and sugar beets 90%. This is shown by the following table.

Poland's Agricultural Production
(In thousand metric tons)

	Prewar crops*	Losses in the east*	Gains in the west*	Total production in 1949	
				Possible	Estimated
Wheat	2,171.9	956.3	997.5	2,213.1	1,814.7
Barley	1,371.3	498.1	815.5	1,688.7	1,050.4
Rye	7,253.4	2,048.7	2,763.6	7,968.3	6,493.0
Oats	2,656.5	988.6	1,761.4	3,429.3	2,473.0
Potatoes	34,558.2	11,434.1	13,985.1	37,109.2	32,629.0
Sugar beets	3,162.4	420.9	2,010.2	4,751.7	4,226.4

*Annual averages for 1934–38.

In the new six-year plan starting in 1950 Poland was expected to reach by 1955 a production of 90,000,000 tons of coal, 7,000,000 tons of steel (a threefold expansion in comparison with 1938), 23,500,000,000 kw.hr. of electric power (almost four times as much as in 1938). By 1955 Polish industry was to produce annually 12,000 tractors and 18,000 motor vehicles, but plans for consumption goods were on a more modest scale: the 1955 targets for cotton and wool yarn were 137,300 and 49,500 metric tons respectively, which meant only a 77% increase for cotton and 45% for wool. It was not expected that the agricultural output in 1955 would exceed the 1938 levels (described as possible in the table). If collectivization were forcibly introduced not only the 1938 levels would not be reached by 1955, but there would be a decrease from the 1949 production volume. This probably explains why by 1949 there were only 170 collective farms covering less than 1% of the arable land. Collectivization, therefore, was postponed and for the time being the Communists were cautious with the peasants.

The Moscow policy, adopted in 1944, of appointing soviet officers to all key posts in the army of the strategically most important European satellite state was crowned in 1949 when the soviet government put at the disposal of Poland Marshal Konstantin Rokossovsky (thenceforward Konstanty Rokosowski). On Nov. 7 he was accorded by decree Polish citizenship and rank of marshal in the Polish army and was appointed minister of national defense and commander in chief of the Polish forces in succession to Marshal Michał Rola Zymierski. With Rokosowski's appointment all important army posts were in the hands of officers who had made their military career exclusively in the soviet army, although some were of Polish descent. The Polish army was believed to consist of 6 army corps, 16 infantry divisions, 5 artillery brigades, 10 armoured regiments, 5 pioneer regiments and 6 signal regiments, totalling in all 250,000 men. There were also 11 brigades of Frontier Guard troops and 18 regiments of Home Security corps under the command of Stanisław Radkiewicz, minister of public security.

On Nov. 14 it was announced that Rokosowski had been coopted as a member of the central committee of the Communist party and that Władyslaw Gomułka, Marian Spychalski and Zenen Kliszko were expelled from the central committee and forbidden to be in charge of any state or party office. In Nov. 1949 an article by Edward Ochab in the Communist monthly *Nowe Drogi* (New Ways) accused Gomułka of "building a wall of mistrust between Poland and the Soviet Union." Spychalski, former deputy minister of national defense, and Kliszko, former chairman of the parliamentary group of the Communist party, both friends of Gomułka, were accused of enabling enemy agencies to secure responsible posts and act against the People's democracy. Among many high officials arrested was Józef Dubiel, former deputy minister of recovered territories and another friend of Gomułka. According to Bierut himself, Dubiel had already confessed to having been a Gestapo agent during World War II.

Education.—(1949) Schools: kindergarten 5,239, pupils 240,839; elementary 22,133, pupils 3,241,046; secondary, lower grade 335, pupils 197,110, higher grade 486, pupils 140,893; secondary vocational 1,131, pupils 183,440; teachers' colleges 149, students 31,000; universities (8), technical colleges (5) and other schools of higher education (14) had 92,444 students. Illiteracy (mid-1949 est.): 1,100,000.

Finance and Banking.—Budget (1949 est.): revenue and expenditure balanced at 612,058,000,000 zlotys. Currency circulation (Dec. 1948, last figure published): 128,800,000,000 zlotys. Deposit money (Dec. 1948): 150,300,000,000 zlotys. Monetary unit: zloty. Exchange rate: U.S. dollar, official, $1=100 zlotys, premium $1=400 zlotys.

Foreign Trade.—Value (official estimates published in Warsaw in U.S. dollars, 1948): imports $509,000,000, exports $528,700,000. Weight (in metric tons, 1948): imports 4,431,900, exports 32,094,300 including coal 24,752,500.

Transport and Communications.—Railways (Jan. 1948): 21,415 km.; freight traffic (in metric tons-km., 1948): 28,188,000,000; passenger traffic (in passenger-km., 1948): 19,848,000,000. Roads (April 1947): 96,605 km.; licensed motor vehicles (April 1948): cars 24,240, trucks 28,957, motorcycles 24,561. Shipping (May 1949): merchant vessels 46, total tonnage 164,989 gross registered tons. Freight traffic in Polish ports: (1948, total imports and exports) Gdansk-Gdynia 12,700,000 metric tons, Szczecin 3,200,000 metric tons. Telephones (Jan. 1948): subscribers 137,400. Radio receiving set licences (July 1949): 1,054,551 including 335,489 home loud-speakers.

Police.

One of the indices of the gradual return of western Europe to civil policing was the restoration of the International Criminal Police commission to full operating status from a Paris headquarters. This representative police agency had been based in Vienna prior to and during World War II, and hence had been "captured" by Adolf Hitler's police agents at the time of the German *Anschluss*.

Most important single police event in Great Britain was the inauguration of the police college at Ryton-on-Dunsmore, to which all forces might send students (total enrolment 225) from the intermediate ranks. Operating under the joint control of the home office and local police authorities, the police college aimed to improve the fitness of its students to hold higher rank. Students were nominated by local authorities from among those who had already given evidence of ability to rise in the service. The established standards and procedures of promotion were in no way affected by this major departure in police training.

Less satisfactory was the outlook for the general police service in England and Wales. While losses through resignations during the early years of police service had always occurred, usually at the rate of 10% or 12% of the total recruited, the postwar losses of police manpower had ranged between 25% and 50%. With total police strength at a low point, this impaired capability to hold recruits after schooling and indoctrination suggested the need for vigorous action in restoring the attractions of police service.

Also causing police concern was the continuing rise in crime, which in the words of an official agency had "touched the conscience of the nation."

Under the Police acts of 1946, 11 Scottish county constabu-

Table I.—*Numerical Strength of U.S. Municipal Police Forces*

(Number per 1,000 inhabitants)

Population groups of cities	1949	1948	1939
Group I—Over 250,000	2.41	2.33	2.19
Group II—100,000 to 250,000	1.73	1.67	1.47
Group III—50,000 to 100,000	1.71	1.65	1.36
Group IV—25,000 to 50,000	1.56	1.50	1.21
Group V—10,000 to 25,000	1.44	1.37	1.08
Group VI—Less than 10,000	1.35	1.29	1.11
Average police employees per 1,000 inhabitants	1.89	1.83	1.65

laries were combined in 1948–49 to form three new forces, with other changes of similar character impending. Similarly three county forces in Wales were amalgamated while one county borough in England set up its own police establishment separately from the county constabulary by which it previously had been served.

Police developments in the United States continued along lines of more manpower and more equipment. Numerical strength of police forces rose to the highest level in the nation's history, and this, combined with rising salary scales and pension costs, was reflected in total police expenditures without parallel.

Municipal police killed in line of duty in the United States totalled 64 in 1948, a slight decline from 1947 levels. Highest police fatality rates were in the west south central and south Atlantic regions, with New England cities showing rates less than one-tenth as high.

As measured by percentage of known offenses for which someone was arrested and charged, 1948 projected still further the slow but steady rise in municipal-police effectiveness during the past two decades. Yet the hard fact remained that levels of performance were less satisfactory for manslaughter and burglary than they had been in 1941, when the numerical strength of municipal police was about 10% lower.

Table II.—*Per Cent of Crimes Cleared by Arrest in U.S. Cities*

Uniform Crime Classification	1948	1947
Murder and nonnegligent manslaughter	90.9	88.1
Manslaughter by negligence	84.1	85.5
Rape	79.0	76.5
Robbery	41.8	41.1
Aggravated assault	79.2	79.6
Burglary	29.7	29.2
Larceny	22.7	22.4
Auto theft	27.3	29.2

The number of males arrested, charged and fingerprinted increased by 6.1% during the first half of 1949, as compared with a 3.5% increase for females. Persons under 21 years of age represented 15.3% of the total fingerprinted, but this did not reflect the full extent of youthful criminality because of widely varying policies in fingerprinting young persons. Out of the nation's total of fingerprinted offenders, 59.4% were identified by the national identification division of the FBI as having been arrested previously. In effect, about 250,000 persons fell into this repeater category in 1949 alone. Members of the white race constituted three-fourths of all persons fingerprinted by police, the rest consisting almost entirely of Negroes.

The International Association of Chiefs of Police held its annual congress in Dallas, Texas, during the second week of Sept. 1949. About 1,000 police administrators, most of whom represented U.S. and Canadian police forces, were in attendance. (*See* also CRIMES; FEDERAL BUREAU OF INVESTIGATION; SECRET SERVICE, U.S.)

Political Parties, British.

Parliamentary by-elections and local elections during 1949 supplied both the main parties with ample material for optimistic speculation about the result of the next general election, but no conclusive evidence of a sweeping change in public opinion. The six parliamentary seats contested between January and December were all held by the Labour party though with reduced majorities. In the county council elections in April the Labour party lost over 350 seats and the Conservatives gained correspondingly. Over 800 Labour seats were lost, mainly to the Conservatives, in the borough elections in May. Conservative satisfaction was tempered, however, by the knowledge that government supporters seldom turn out in full force at local elections. At Westminster the Labour party seemed more secure than ever, at least until the announcement of devaluation in September. The prime minister, Clement Attlee (*q.v.*), though constantly expected to reshuffle his cabinet, did not do so.

Thus fortified against opposition from within, the government carried out its legislative program with what seemed to its supporters a splendid steadfastness and to its opponents a remarkable indifference to the actual state of the country. The timetable, which had been carefully worked out, provided for the passage of the Parliament bill, reducing the delaying powers of the house of lords to one year, and the bill for the nationalization of iron and steel, by the end of 1949. According to the opposition, and to most independent observers, the object of the Parliament bill, which was to operate retroactively, was to enable the Iron and Steel Nationalization bill to become law in spite of the opposition of the upper house before the general election of 1950. The better part of two years had been expended on the ceremony of presenting these bills to the lords and laboriously repeating the arguments for and against them, and the process had almost reached its foreordained conclusion when the government announced that it had decided to introduce an amendment which would have the effect of postponing the application of the Iron and Steel Nationalization bill until after the general election. This met the requirements of the opposition and the house of lords fully and had indeed already been proposed by them.

The Labour Party.—Meantime, preparations for the general election continued. The government, like all parties which have successfully accomplished a revolution, was faced with the problem of what to do next. Some favoured a policy of safety first and the consolidation of gains already made. Others, notably a section of the rank and file of the trade union movement, wished to move from public ownership to workers' control and had begun to murmur that centralized bureaucracy was only one degree better than capitalist exploitation. Finally, convinced doctrinaires wished to continue nationalizing industries and differed about the point at which the process should stop. The party's program, embodied in a pamphlet entitled *Labour Believes in Britain*, attempted a compromise between these views. Industrial insurance, the cement industry, sugar refining, the wholesale meat trade, slaughter-houses, cold storage, water supply and what were comprehensively described as "all suitable minerals" were to be brought under public ownership. The chemical industry would be considered for nationalization. Shipbuilding and repairing would be dealt with by the appointment of a development council; and land would be acquired by the state, as indeed it always had been, when the public interest was deemed to necessitate it.

At a conference at Blackpool in June this program was approved by an overwhelming majority. A similar and even more striking success was achieved at the Trades Union congress conference in early September, when the government's demand for restraint on wage claims was approved by a majority of 6,500,000 to 1,000,000. After the devaluation of the pound the government was forced to make cuts in public expenditure which the opposition condemned as inadequate and Labour supporters accepted loyally but reluctantly. More serious still, it had to intensify its campaign for the freezing of wages. Here it was able to report considerable success by the end of the year. Faced by the financial and economic crisis, the government still declined to make any fundamental change in its domestic policy.

The Conservative Party.—The preparations of the Conservative party were hastened by a rumour which became current in the summer that the prime minister would appeal to the country in the autumn. The party was united in demanding a reduction of public expenditure, the restoration of incentives to production and the abolition of vexatious controls. Within this framework, however, there was much room for disagreement. Some members appeared to favour a policy of wholesale denationalization, accompanied by rigorous disinflation and the nearest possible return at home and abroad to the conditions of a free economy. Others held that the first duty of a government was to maintain a minimum standard of living, that the social services were sacrosanct and that economies could only be effected within the limits set by these conditions. Nationalization could not be wiped out, though its extension must be resisted and some attractive alternative to it found. In imperial and foreign policy, divisions also appeared. A group of members, under the patronage of Winston Churchill (*q.v.*), looked with disfavour on changes in the structure of the commonwealth designed to enable it to retain members who repudiated their allegiance to the crown; while at the same time many of them, including Churchill, crusaded passionately for a customs union with western Europe and the merging of Great Britain in some kind of western European union. (*See* EUROPEAN UNION.) Others felt that these two policies were incompatible.

After much deliberation the policies and principles of the party were set out in a pamphlet entitled *The Right Road for Britain.* The party decided against general denationalization but put forward practical proposals for improving the efficiency of the nationalized industries by decentralization. It demanded drastic reductions in public expenditure, combined with the full maintenance and some extension of the social services, and a vigorous defense policy. It thus seemed to rely entirely on the elimination of wasteful administration as a means of saving money. The alternative to nationalization was provided by the reaffirmation of the Conservative *Industrial Charter,* which set profit sharing and joint consultation as the ideals of British industry and committed the party, if returned to power, to encouraging their adoption by practical means. The program contrasted the centralized Socialist state administered from Whitehall with the Conservative ideal of a property-owning democracy in which every man would take an active part in the affairs which touched him most closely. To this end local government would be given increased powers and duties; and corporate and voluntary activity within the state would be encouraged. This program was enthusiastically approved at the party conference in London in October. As the weeks passed, however, party spokesmen insisted increasingly not on their long-term program but on the immediate crisis and the superior ability of a Conservative government to cope with it.

The Liberal Party.—The Liberal party, at its conference at Hastings in March, approved the executive's intention to put 600 candidates up at the general election and rejoiced at having already induced 300 to stand. Its program was approved by a large majority, and a new proposal for a flat rate of income tax on all incomes below £500 a year took its place beside federal union, proportional representation and free trade in the party's platform. A bitter controversy in which accusations of Communist and fascist tendencies were freely exchanged arose out of a proposal to cut out the compulsory clause in the scheme for profit sharing and joint control which the Liberals intended to apply to a great part of British industry in the event of their being returned to power. The supporters of compulsion pointed out that in addition to its other merits it was the only aspect of the scheme which distinguished it from the Conservative *Industrial Charter,* and the clause was approved amid scenes of considerable enthusiasm. Throughout the year Liberals continued to protest against any proposal for an electoral truce with the Tories.

The Communists.—The Communist party of Great Britain, assembled at Liverpool in November, demanded the reversal of all policies favoured by all other parties, calling for higher wages, more public expenditure, nonintervention in eastern Europe and the erection of a phenomenal number of houses in a phenomenally short time.

Sir Oswald Mosley's Union movement, which was widely regarded as a reincarnation of the Fascist party, maintained silence throughout the year, although there was some activity among local branches. (T. E. U.)

Polo.

Polo during 1949 possessed international style and quality of play which had been absent since the cessation of play during the war. Argentina sent two teams to the United States. The Venado Tuerto four visited the Pacific coast in the spring where they completed a successful tour against the best players in the west. The only game they lost was to a strong Hurricane team in the Pacific Open championship tournament. A second Argentine team, El Trebol (the clover) arrived in May and played in all the eastern tournaments through September. The team of Juan Reynal, Julio and Carlos Menditeguy and Horatio Castilla won their first six matches including the Inter-America cup in Chicago. They too succumbed to the Hurricane four in the final game of the National Open championship on International field in Westbury, L.I.

ERIC PEDLEY (1) of the U.S. polo team attempting a goal during the first of a series of matches between U.S. and Argentine players at Los Angeles, Calif., in April 1949. The Argentines won the international series 2 to 1

The outstanding team of the 1949 season was the Hurricanes, who captured the Pacific Open, the National Open for the second year in succession and the Monty Waterbury Memorial tournament for the third consecutive year. The line-up included Larry Sheerin, veteran Stephen "Laddie" Sanford, ten-goal Cecil Smith and Roberto Cavanagh of Venado Tuerto fame. Cavanagh was one of the best players in the Argentine and was invited to play with the U.S. champions by Laddie Sanford after their earlier meeting on the west coast.

The university of Miami, Coral Gables, Fla., team won the intercollegiate crown after completing an undefeated season and running its victory streak to 22 games over a two-year period over such opponents as Stanford, Princeton and Yale. Cornell was the outstanding team in the east. (W. Cn.)

Portugal. A republic of western Europe, Portugal forms part of the Iberian peninsula, and is bounded on the east and on the north by Spain. Area: 35,413 sq.mi., including Azores (888 sq.mi.) and Madeira (302 sq.mi.). Pop. (1940 census): 7,722,152; (mid-1948 est.) 8,402,000, including Azores (1940 census: 286,885) and Madeira (250,124). Chief cities (pop., 1940 census): Lisbon (cap., 709,179); Oporto (262,309); Funchal (54,856); Coimbra (35,437). Language: Portuguese. Religion: predominantly Roman Catholic. President: Marshal Antonio Oscar de Fragoso Carmona; prime minister: Antonio de Oliveira Salazar.

History.—After a heated electoral campaign, with threats of army intervention, Gen. José Norton de Mattos withdrew and on Feb. 13, 1949, Marshal Carmona was re-elected president for a fourth seven-year term. At elections for the national assembly on Nov. 13, the União Nacional (pro-government) party was again returned, with negligible opposition. About half of its candidates were civil servants. The new assembly could initiate revision of the 1933 constitution. The archives of the illegal Communist party were seized in Luso in March and its secretary-general, a lawyer, was arrested. In June a public security council was established to tighten preventive and repressive measures against subversive activities.

Features of the 1949 budget, which estimated receipts at 4,309,000,000 escudos, ordinary expenditure at 4,308,000,000 escudos and extraordinary at 1,358,000,000 escudos, were the provision of 317,000,000 escudos for increases in civil service salaries and a cut in public works in favour of development in Mozambique. It was announced in May that Portugal had forgone, in favour of other O.E.E.C. (Organization for European Economic Cooperation) countries, any claim to U.S. financial assistance.

A European regional conference of F.A.O. (Food and Agriculture organization of the U.N.) was held in Lisbon in March, and in April the 16th International Geographical conference. The exchange of diplomatic missions with Pakistan with the rank of legations was agreed on in September.

Following consultations with Spain, Portugal adhered to the North Atlantic treaty (*q.v.*) in April, with the reserve that no use of bases would be granted in time of peace. Salazar stated that the value and significance of Portugal's adherence would be affected by the inclusion or exclusion of Spain. The close understanding with Spain was underlined by the five-day visit to Portugal of Gen. Francisco Franco (*q.v.*) in October.

CAMPAIGN POSTERS for Gen. Jose Norton de Matos being torn down in Lisbon, Port., after he withdrew as presidential candidate on Feb. 11, 1949. Pres. Carmona was then re-elected on Feb. 13 without opposition

The Anglo-Portuguese monetary agreement was extended in April for a year. Great Britain continued to be Portugal's chief supplier and, after the Portuguese colonies, its best customer. A fall in imports from Great Britain was envisaged in a new trade program aiming at approximate equilibrium in payments between the two areas. A one-year trade agreement was signed with France in October, totalling 600,000,000 escudos in each direction. Duties on all imports from abroad, certain agricultural chemicals and food excepted, were increased in June by 60%. In September a fund was created to stimulate exports.

Heavy rainstorms in September ended the longest drought in the country's history, which had severely hit the cotton and woollen industries through cuts in hydroelectric power. Much wheat also had to be imported. A vast reconstruction plan for the centre of Lisbon was approved. Antonio Egas Moniz (*q.v.*), the Lisbon neurologist, shared with a Swiss physiologist the Nobel prize for physiology and medicine. (W. C. An.)

Education.—(1946–47) Primary schools: 10,248, pupils 533,344, teachers 13,747; private elementary schools: pupils 59,698; secondary schools (*liceus*): 43, pupils 20,965, teachers 1,154; private secondary schools: pupils 24,800; technical secondary schools: 58, pupils 39,521, teachers 1,481; commercial schools: 8, pupils 3,150, teachers 204; universities: 3, students 8,568, professors and lecturers 464; institutions of higher education: 3, students 5,846, professors and lecturers 281. Illiteracy (1940) 49%.

Finance and Banking.—Budget: revenue (1950 est.) 5,271,500,000 escudos, expenditure 5,268,300,000 escudos. National debt (1947): internal 10,621,000,000 escudos, external 3,101,000,000 escudos. Currency circulation (Sept. 1949): 7,850,000,000 escudos; (Sept. 1948) 8,170,000,000 escudos. Gold reserve (March, 1949) U.S. $146,000,000; (March 1948) U.S. $184,000,000. Bank deposits (July 1949) 17,230,000,000 escudos; (July 1948) 17,830,000,000 escudos. Monetary unit: escudo. On Sept. 22, 1949, the exchange rate of 28.9 escudos per U.S. dollar was established.

Foreign Trade.—Imports: (1948) 10,351,000,000 escudos; exports: (1948) 4,295,000,000 escudos.

Transport and Communications.—Roads (1947): 16,080 mi. Licensed motor vehicles (Dec. 1948): cars 51,700, commercial vehicles 21,200. Railways (1947): 2,240 mi.; passenger traffic 47,023,722 metric tons; freight traffic 5,210,802 metric tons. Shipping (July 1948): number of merchant vessels of 100 tons and upward 320, total tonnage 471,438. Telephones (1948): 114,818. Radio receiving set licences (1948): 974,192.

Agriculture and Fisheries.—Main crops (in metric tons, 1948): wheat 322,000; barley 88,000; oats 99,000; maize 317,000; rye 131,000;

potatoes 994,000; rice 89,000; dry beans 40,000. Livestock: cattle (Dec. 1945) 950,000; sheep (Dec. 1947) 4,000,000. Fisheries total catch (1948): weight 180,606 metric tons; value 669,000,000 escudos. Production (1948): meat (in metric tons) 70,800; milk (in metric tons) 330,000; olive oil 315,930 hectolitres; wine 8,162,000 hectolitres.

Industry.—Fuel and power (in metric tons, 1948): coal 386,000; lignite (in metric tons) 103,000; manufactured gas 1,234,000 cu.ft.; electricity 805,000,000 kw.hr. Raw materials (in metric tons, 1948): lead 1,650; tin content of cassiterite 710; iron pyrites 556,135; wolfram 2,511; antimony 84; sulphur 9,826; manganese 280; chromium 170; baryta 396; sulphur pyrites 9,826; cork 140,442. Manufactured goods (in metric tons, 1948): cotton yarn 31,486; cotton piecegoods 24,452; refined sugar 63,896; sulphuric acid 200,069; superphosphates 302,845; cement 500,000.

FILMS OF 1949.—*Iberian Peninsula* (Encyclopædia Britannica Films Inc.).

Portuguese Colonial Empire.

Under this heading are grouped the Portuguese possessions in Africa and Asia. Total area (approx.): 803,835 sq.mi.; total population (mid-1948 est.): 12,998,000. Certain essential facts and figures relating to the Portuguese colonies are given in the accompanying table.

History.—In July 1949 the Indian Congress party president, echoing Pandit Jawaharlal Nehru's statement of Nov. 12, 1948, declared that neither the French nor the Portuguese possessions in India could have a separate existence from the Indian union. A conference held at Belgaum, India, had earlier demanded the accession of Gôa to the union. (Portuguese India had been given in Dec. 1946 the status of a metropolitan province.)

The garrison at Macao was reinforced in August from Portugal and Portuguese Africa to a total of about 6,000. In November, as the Chinese nationalists withdrew from the neighbourhood, many stragglers and a number of nationalist gunboats and armed junks sought refuge in Macao, drawing some Communist shelling.

On Jan. 1 the Portuguese government redeemed the Beira (Mozambique) concession, and port and railway passed to the Mozambique colonial administration. An international conference of African transport, covering railways, inland waterways, roads and ports, met in Lisbon, Port., in May with a view to the co-ordination of developments throughout the territories of central and southern Africa. A plenary conference in Africa was to follow. Coal deposits believed sufficient to supply the whole Portuguese empire were discovered at Maniamba, Mozambique.

Considerable developments in public works were recorded in the African colonies (and in Timor) and, taken in conjunction with the provision of government-paid passages for emigrants and their families going to guaranteed employment, were reflected in substantial increase in emigration from Portugal.

The minister for colonies reaffirmed in February that Portuguese policy continued firmly opposed to the modern trend toward autonomy and eventual independence for colonial territories.

(W. C. AN.; X.)

Post Office.

United States.—Revenues of the post office department for the fiscal year 1948–49 amounted to $1,571,851,202.12. Estimated postage that would have been collected if the service had been on a regular pay basis in the case of penalty and franked mail, free-in-county mail, differentials in second-class mail matter and free matter for the blind and the cost of aircraft service over the postage revenue derived from air mail amounted to $120,118,663.

The expenditures of the department for the fiscal year amounted to $2,149,322,128.38, of which amount $147,013,101.84 was on account of prior years. There was $120,671,703.36

unpaid on account of the 1949 fiscal year. This left a total expense of $2,122,980,729.90, resulting in a gross operating deficit on an accrual of $551,129,527.78. This amount did not include pending retroactive payments to railroads, but did include a 25% interim increase granted participating railroads by the Interstate Commerce commission. It also included the estimated increased cost for pending establishment of permanent rates on air mail routes by the Civil Aeronautics board.

The tremendous increase in the volume of mail handled by the post office department for other branches of the government had been a matter of concern to congress and the department for a number of years. Thousands of tons of forms, pamphlets, circulars and supplies were sent by government departments and establishments free of postage under the penalty privilege.

Congress passed an amendment to the penalty mail law providing that all envelopes, wrappers, cards and other articles bearing the indicia for matter mailed free of postage by all government departments and agencies should be procured or accounted for through the postmaster general. During the fiscal year ended June 30, 1949, 1,470,000,000 free pieces weighing 177,000,000 lb. were mailed for other government departments—an increase of 52,000,000 pieces but a decrease of 2,500,000 lb. from the fiscal year 1948.

On June 30, 1948, war savings stamps were on sale at 41,607 offices. Sales from July 1, 1948, to June 30, 1949, amounted to $15,067,254.50. During the fiscal year 6,459,306 savings bonds with a sale value of $368,181,468.75 were sold. At the close of 1948, bonds were on sale at 26,503 post offices.

Through the 41,607 post offices and 3,724 stations being conducted under contract agreement, as well as 2,083 stations and branches, there were received, transported and delivered 43,380,000,000 pieces of mail matter during the fiscal year having a weight of 11,623,000,000 lb., an increase of 3,000,000,000 pieces and 1,300,000,000 lb. from the previous fiscal year.

Delivery service was established in 143 additional cities during the fiscal year, thereby increasing to 4,413 the number of cities in which this service was operated.

During 1949 it was impossible to deliver 18,142,721 letters—an increase of 23% from the previous year. A total of 4,075,970 were returned to the senders. Letters containing valuable enclosures numbered 374,234, of which 102,442 contained money amounting to $209,272.18. There were also 718,156 unclaimed parcels and articles found loose in the mails. A total of 592,944 were returned to the senders. The remaining 125,212 parcels were sold at public auction and $135,532.56 was realized.

On June 30, 1949, there were 155,314 mi. of domestic air mail routes in the United States—an increase of 25,221 mi. over June 30, 1948. Three new domestic air mail routes were established. The domestic air mail rate was raised to six cents, effective in Jan. 1949. A four cent air mail postal card was authorized for the first time in that year. Foreign air parcel post was inaugurated on March 15, 1948, and domestic air parcel post on Sept. 1.

Rural Delivery.—The rural delivery routes in operation on June 30, 1949, required a total daily travel of 1,480,710 mi. by rural carriers in providing service to approximately 30,120,663 patrons. Operation of the service resulted in an expenditure of $152,800,000 for the fiscal year compared with $132,159,009 for the previous year. Amounts saved through consolidation of routes were utilized to establish new routes and provide extension of existing routes.

Postal Savings.—Postal savings depositors numbered 3,964,509 for 1949—a decrease of 3.6% from the preceding year. The balance due depositors by outstanding certificates of deposits was $3,277,173,306—a decrease of $101,797,489 or 3%. In addition there was held in trust for depositors accrued interest of $113,251,238 and unclaimed deposits of $228,964, making a total of $3,390,653,508. At the end of the fiscal year, postal savings certificates were on sale at 8,195 depositories, including 982 branches and stations, and savings stamps were on sale at all post offices and practically all branches and stations.

HIGHWAY POST-OFFICE COACH built for the U.S. postal department in 1949 by the Twin Coach Co. of Kent, O. It was designed for economical handling of large quantities of mail on routes not served as efficiently by smaller size units

Buildings.—During the fiscal year ended June 30, 1949, the post office department operated 3,262 government-owned buildings. No new buildings were completed during this period.

(I. Gg.)

Canada.—Revenues for the 1948–49 fiscal year showed an increase of $4,343,850 to $95,957,468, highest in Canadian postal history. There were 12,000 post offices in operation with 42,000 employees. Money order and postal note business was the highest on record: 28,851,065 transactions, totalling $415,703,754. During 1949 new stamps issued included: commemorative four-centers, (1) entry of Newfoundland into Canadian confederation, (2) Halifax centennial, (3) Princess Elizabeth's marriage; regular series, new King George VI issue for one-cent, two-cent, three-cent, four-cent and five-cent stamps, showing his majesty in civilian clothes. "All-Up" service—carrying of ordinary mail by air—was further expanded to include Newfoundland. Direct air mail service, on the 20th anniversary of Canadian air mail, was established to Bermuda and Trinidad, to Australasia and the orient. Rates on gift parcels for the United Kingdom were substantially reduced to encourage flow of food packages to lighten British austerity. (C. Cy.)

Great Britain.—The total value of post office transactions in Great Britain with the public during the year ended March 31, 1949, was £3,053,595,000. This was a reduction of about £32,405,000 on the figure for the preceding 12 months, and was more than accounted for by a decrease in the savings bank deposits.

Postal.—The number of letters and letter packets posted during 1948–49 was estimated to have been 8,050,000,000, an increase of 450,000,000 on the traffic for 1947. The number of parcels handled during the year dropped from 243,500,000 to 239,601,000. This latter figure included 16,024,000 received from abroad, of which about 13,000,000 were gift parcels, mostly food and mainly from the British Commonwealth of Nations and the United States. On May 1, 1949, the inland registration fees were raised by one penny at each step of the scale. The minimum fee became 4*d.* covering compensation up to £5, 5*d.* covering compensation up to £20, then by 1*d.* at each step up to the maximum of 2*s.* for £400.

Air parcel services were started in April 1949 to many countries in Europe, and on June 1 the arrangements whereby first class mail (letters, letter packets and post cards) could be forwarded by air or surface route, whichever offered the earlier delivery, were extended to include Germany. A reduced air postage rate of 4*d.* a half-ounce was introduced on July 1 for second class mail (printed papers, commercial papers, samples, literature for the blind and small packets) to Canada, the United States and Mexico, thus extending this facility to include the whole of the western hemisphere. Some additional internal air mail services were introduced during 1949 and, in co-operation with British European Airways, the post office continued to study the problem of using helicopters for inland mail services.

Savings Bank.—Deposits for the year ended March 31, 1949, amounted to £371,869,000, a decrease of £54,959,000 on the sums deposited in 1947–48. The number of separate deposit accounts at the end of March 1949 was 23,562,000; on Dec. 31, 1948, the total amount due to depositors stood at £1,948,051,000. In the first three months of 1949, 22,050,000 savings certificates were purchased.

Personnel.—In March 1949 post office personnel numbered 348,224, with a wage bill (including national insurance contributions) of £113,250,000 a year. (For telecommunications, which in Great Britain constitute part of the operations of the post office department, *see* the article Telegraph. *See* also Philately and Photography.)

Potatoes.

Total production of white potatoes in the U.S. in 1949 was again large at 401,962,000 bu., although 12% smaller than the 454,654,000 bu. of 1948, and compared with an average for the decade of 393,403,000 bu. In response to government request for acreage reduction to 1,938,000, the harvested acreage reached a new record low of 1,901,000, compared with 2,109,000 in 1948 and an average for 1938–47 of 2,730,000. Per-acre yields dropped slightly below the 1948 record, averaging 211.4 bu. against 215.5 in 1948 and only 145.5 for 1938–47.

An average price of approximately $1.40 per bushel was estimated for the crop, as compared with $1.55 for the 1948 crop; prices during 1949 varied between a high of $1.81 per bushel in the spring to $1.30 in October. The smaller crop with a support price of only 60% of parity meant that market prices for the most part were above support levels, acquisition under the government program promised to be smaller than for the 1948 crop but estimates of the probable loss ranged as high as $60,000,000. As of June 30, 1949, the Commodity Credit corporation reported that 101,926,292 cwt., or 38% of the 1948 crop of potatoes, of estimated value of $228,184,686, had been placed under price support. In Nov. 1949 the secretary of agriculture announced a 1950 price-support program based on 60% of a recomputed parity, or about $1.60 per hundredweight (96 cents per bushel). The national acreage allotment goal for commercial production for 1950 was set at 1,137,800 for a prospective production of 335,000,000 bu.

Estimated world potato production in 1949–50 of 8,000,000,000 bu. was 9% below the 8,800,000,000 bu. of 1948–49 and 4% below the prewar average. Acreage yields dropped to about 150 bu. compared with 168 bu. in 1948–49 and 164 bu. prewar. Acreage devoted to potatoes amounted to 53,300,000, 6% above prewar and slightly larger than the 52,200,000 ac. of 1948–49. Europe produced 55% of the crop, in spite of the fact that adverse weather in the western areas reduced the crop of that section 27% compared with 1948.

U.S. Potato Production by Leading States

(In thousands of bushels)

State	1949	1948	1947	Average, 1938–47
Late crop				
Maine	67,050	74,305	64,400	52,728
Idaho	34,560	45,000	28,600	35,048
New York	30,660	38,035	33,090	30,558
Pennsylvania	19,158	19,425	17,985	19,275
North Dakota	18,530	20,000	20,480	17,787
Colorado	18,150	21,450	18,500	15,506
Michigan	17,160	16,350	12,390	19,054
California	16,200	14,965	11,900	11,418
Minnesota	16,000	17,280	16,940	18,648
Wisconsin	13,600	13,050	10,080	13,292
Oregon	11,890	12,710	9,500	9,569
Washington	10,080	12,600	9,800	8,449
Intermediate Crop				
Virginia	9,126	11,529	9,450	8,808
New Jersey	8,554	13,629	13,514	10,793
Kentucky	2,730	2,542	3,366	3,750
Missouri	2,432	3,128	2,120	3,792
Early Crop				
California	30,030	32,400	26,040	17,430
North Carolina	7,869	10,430	8,840	9,128
Florida	5,428	3,745	3,272	4,240
Texas	3,686	4,356	4,536	4,419
Alabama	3,432	3,640	3,330	4,382
Tennessee	2,250	2,322	2,880	3,273
Arkansas	2,080	2,366	2,520	3,262

Sweet Potatoes.—The U.S. sweet potato crop of 1949 amounted to 54,232,000 bu., 8% more than the 50,204,000-bu. crop of 1948, but 15% below the 63,626,000-bu. average for the previous decade. The 542,000 ac. harvested exceeded the record low of 516,000 ac. in 1948, but was the second smallest of the century. The average yield of 100.1 bu. per acre exceeded the 97.4 bu. of 1948 and the 89.7-bu. average of the decade. The Texas yield of 105 bu. per acre against 65 bu. in 1948 was notable. Louisiana, as usual, was the leading producer (8,330,000 bu.), followed by Georgia (6,030,000 bu.), North Carolina (5,876,000 bu.) and Texas (5,775,000 bu.). The season average price to producers for the 1949 crop was estimated at $2.14 per bushel, not much below the $2.22 per bushel for the 1948 crop. (*See* also Food Supply of the World; Vegetables.)

Presbyterian Church.

The western section of Reformed Churches throughout the world holding the Presbyterian system, within the United States of America, numbered 12 branches of Reformed Churches in 1949 and included 18,431 ministers, 18,479 churches and 4,234,288 communicant members.

The western section of the World Presbyterian alliance took steps in Feb. 1949 to promote the union of churches with emphasis on the reunion within the Reformed and Presbyterian Churches. Negotiations toward union were in progress between the Presbyterian Church in the United States (Southern) and the Presbyterian Church in the United States of America; and between the United Presbyterian Church of North America and the Reformed Church in America. A union of the Evangelical and Reformed Church with the Congregational-Christian Church was scheduled to form the United Church of Christ.

One of the great undertakings assumed by the member churches of the western section was the raising of funds for restoration of religious activities in countries ravaged by World War II. In the Presbyterian Church, U.S.A., alone, the cash returns reported in May 1949 amounted to $23,155,444. Extended Christian service through ministers and lay workers and the restoration of places of worship were made possible through these funds. The churches also undertook to help displaced persons in European countries.

Protestantism continued to make unusual strides in the Latin American countries. The first Inter-American Evangelical conference, which met at Buenos Aires, Arg., from July 18 to 31, 1949, was composed of approximately 70 official delegates from 17 countries of Latin America. Two major tasks of the Evangelical churches in Latin America were the dissemination of the Bible and the combating of secularism. In these tasks the Presbyterian and Reformed delegates held a special meeting to promote more united action in Latin America.

In the area of spiritual advance the emphasis upon evangelism produced significant results within the ranks of Presbyterian and Reformed Churches. The spiritual awakening brought many unchurched to a sense of their spiritual needs and resulted in increased membership. Through the New Life movement in the Presbyterian Church, U.S.A., many young people enlisted in the work of the church. The Westminster fellowship, the Geneva fellowship and the Westminster foundations did much to enlist the support of young people in Christian life and work. The women, through their local and national organizations, enlarged their mission work. The National Council of Presbyterian Men, organized in 1948, continued to educate Christian laymen in the work of Christian missions and in the vital relationship between protestantism and freedom.

Europe.—From the distraught conditions of the Reformed Churches in Europe a new life and a new structure were arising. The meetings of the Council of Reformed Churches at Geneva, Switz., in Aug. 1948 had initiated a more widespread influence. The extent of this Reformed influence was stated thus: "that of all the non-Roman Communions the Reformed is the most catholic both in geographical extension and in variety of race and language." Representatives to the council came from France, the Netherlands, Switzerland, Italy, Germany, Czechoslovakia and Hungary (with the largest Reformed Church on the continent). Delegates were present from Scotland, Ireland, England, Northern India, Ceylon, South Africa, Australia, New Zealand and America. Headquarters of the alliance opened in Geneva in Jan. 1949. This World Presbyterian alliance offered assistance to the European Reformed Churches in providing funds for the rebuilding of churches and for the sending of ministers into new areas. The alliance also enlisted women and youth through their organizations to further Christian brotherhood and ecumenical understanding. (*See* also CHURCH MEMBERSHIP.) (W. B. PU.)

Presidents, Sovereigns and Rulers.

The following list includes the names of those holding chief positions in their countries as of Jan. 1, 1950:

Country	Name and Office	Accession
Afghanistan	Mohammad Zahir Shah, King	1933
	Sardar Shah Mahmud Khan, Prime Minister	1946
Albania	Dr. Omer Nishani, Chairman of the Praesidium of the People's Assembly	1946
	Col. Gen. Enver Hoxha, Prime Minister	1944
Arabia, Saudi	'Abd-al-'Aziz Ibn-'Abd-al-Rahman Ibn-Faisal Ibn-Sa'ud, King	1927
Argentina	Gen. Juan Domingo Perón, President	1946
Australia	William John McKell, Governor General	1947
	Robert Gordon Menzies, Prime Minister	1949
Austria	Karl Renner, President	1945
	Leopold Figl, Chancellor	1945
Belgium	Leopold III, King (in exile)	1934
	Prince Charles, Regent	1944
	Gaston Eyskens, Prime Minister	1949
Bolivia	Mamerto Urriolagoitia, President	1949
Brazil	Gen. Eurico Gaspar Dutra, President	1946
Bulgaria	Mincho Neychev, Chairman of the Praesidium	1947
	Vasil Kolarov, Premier	1949
Burma	Sao Shwe Thaik, President of the Union of Burma	1948
	Thakin Nu, Prime Minister	1948
Canada	Field Marshal Viscount Alexander of Tunis, Governor General	1946
	Louis Stephen St. Laurent, Prime Minister	1948
Ceylon, Dom. of	Lord Soulbury, Governor General	1949
	Don Stephan Senanayake, Prime Minister	1948
Chile	Gabriel González Videla, President	1946
China	Li Tsung-jen, Acting President of the National Government	1949
	Yen Hsi-shan, Premier	1949
China, People's Republic of	Mao Tse-tung, Chairman of the Central People's Government of the People's Republic of China	1949
Colombia	Mariano Ospina Pérez, President	1946
Costa Rica	Otilio Ulate Blanco, President	1949
Cuba	Carlos Prío Socarrás, President	1948
Czechoslovakia	Klement Gottwald, President	1948
	Antonín Zápotocký, Prime Minister	1948
Denmark	Frederick IX, King	1947
	Hans Hedtoft, Prime Minister	1947
Dominican Rep.	Gen. Rafael Leónidas Trujillo y Molina, President	1942
Ecuador	Galo Plaza Lasso, President	1948
Egypt	Farouk I, King	1936
	Hussein Sirry Pasha, Prime Minister	1949
Ethiopia	Haile Selassie I, Emperor	1930
	Bitwoded Makonnen Endalkatchou, Prime Minister	1944
Finland	Juho K. Paasikivi, President	1946
	Karl August Fagerholm, Prime Minister	1948
France	Vincent Auriol, President of the Fourth Republic	1947
	Georges Bidault, President of the Council of Ministers (Prime Minister)	1949
Germany (East) German Democratic Rep.	Wilhelm Pieck, President	1949
	Otto Grotewohl, Minister-President (Premier)	1949
(West) Federal Rep. of Germany	Theodor Heuss, President	1949
	Konrad Adenauer, Chancellor	1949
Great Britain	George VI, King	1936
	Clement R. Attlee, Prime Minister	1945
Greece	Paul I, King	1947
	Alexander Diomedes, Prime Minister (resigned Jan. 5, 1950)	1949
Guatemala	Juan José Arévalo, President	1945
Haiti	Dumarsais Estimé, President	1946
Honduras	Juan Manuel Gálvez, President	1949
Hungary	Arpad Szakasits, President	1948
	Istvan Dobi, Prime Minister	1948
Iceland	Sveinn Bjornsson, President	1944
	Olafur Thors, Prime Minister	1949
India, Dom. of	Chakravarti Rajagopalachari, Governor-General	1948
	Jawaharlal Nehru, Prime Minister	1947
Indo China		
Cambodia	Norodom Sihanouk, King	1941
Laos	Sisavang Vong, King	?
Viet-Nam	Bao Dai, Emperor and Premier	1949
Viet-Nam, Democratic Rep.	Ho Chi Minh, (Communist) President	1945
Indonesia, Rep. of the United States of	Achmed Soekarno, President	1949
	Mohammed Hatta, Premier	1949
Iran	Mohammed Riza Pahlavi, Shahanshah	1941
	Mohammed Said Maraghei, Prime Minister	1948
Iraq	Feisal II, King	1939
	Abdul-Ilah, Prince Regent	1939
	Ali Jawdat al-Ayyubi, Prime Minister	1949
Ireland, Rep. of	Sean T. O'Kelly, President	1945
	John A. Costello, Prime Minister	1948
Israel	Chaim Weizmann, President	1948
	David Ben-Gurion, Prime Minister	1948
Italy	Luigi Einaudi, President	1948
	Alcide de Gasperi, Prime Minister	1946
Japan	Hirohito, Emperor	1926
	Shigeru Yoshida, Premier	1948
	Gen. Douglas MacArthur, Supreme Commander for the Allied Powers	1945
Jordan	Abdullah ibn Hussein, King	1946
	Tawfiq Pasha Abu-Huda, Prime Minister	1947
Korea (South) Rep. of Korea	Syngman Rhee, President	1948
(North) Democratic People's Rep. of Korea	Kim Il-sung, Premier	1948
Kuwait	Sheikh Sir Ahmed ibn Jabir al-Subah	1921
Lebanon	Sheikh Bishara al-Khuri, President	1943
	Riad Bey al-Sulh, Prime Minister	1946
Liberia	William V. S. Tubman, President	1944
Liechtenstein	Franz Joseph II, Sovereign Prince	1938
	Alexander Frick, Chief of Government	1945
Luxembourg	Charlotte, Grand Duchess	1919
	Pierre Dupong, Premier	1937
Mexico	Miguel Alemán, President	1946
Monaco	Rainier III, Prince	1949
Morocco	Sidi Mohammed ben Youssef, Sultan	1927
	Gen. Alphonse-Pierre Juin, French Resident General	1947
Nepal	Tribhubana Bir Bikram Jung Bahadur, King	1911
	Gen. Sir Mohan Shumshere Jung Bahadur, Prime Minister	1948
Netherlands	Juliana, Queen	1948
	Willem Drees, Prime Minister	1948
New Zealand, Dom. of	Lt. Gen. Sir Bernard Freyberg, Governor General	1946
	Sidney George Holland, Prime Minister	1949
Nicaragua	Victor Manuel Román y Reyes, President	1947
Norway	Haakon VII, King	1905
	Einar Gerhardsen, Prime Minister	1945
Oman (Muscat)	Sir Sayyid Said bin Taimur, Sultan	1932
Pakistan, Dom. of	Khwaja Nazimuddin, Governor General	1948
	Liaquat Ali Khan, Prime Minister	1947
Panamá	Arnulfo Arias Madrid, President	1949
Paraguay	Federico Chaves, President	1949
Peru	Gen. Manuel Odría, President of the Military Junta of Government	1948
Philippines, Rep. of the	Elpidio Quirino, President	1948
Poland	Boleslaw Bierut, President	1947
	Jósef Cyrankiewicz, Prime Minister	1947
Portugal	Marshal Antonio Oscar de Fragoso Carmona, President	1928
	Antonio de Oliveira Salazar, President, Council of Ministers (Prime Minister)	1932
Rumania	Constantin Parhon, Chairman of the State Praesidium	1948
	Petru Groza, Prime Minister	1945

Zanzibar	(Sir) Sayyid Khalifa bin Harub	1911
	Sir Vincent Goncalves Glenday, British Resident	1946

Prices.

In the United States a gradual decline in the general levels of both wholesale and retail prices which began in the late summer of 1948 continued throughout 1949. By December, wholesale prices had declined 10.6% and retail prices 4% from the postwar highs in Aug. 1948. Wholesale prices of all major commodity groups had fallen, the most substantial decreases being registered in farm products (21.3%), chemicals and allied products (16.4%) and food (16.1%). At the retail level, decreases in the prices of food (9.0%), apparel (7.8%) and housefurnishings (6.7%) were somewhat offset in the cost-of-living index by the relatively small increases in rent, miscellaneous, and fuel, electricity and refrigeration, all of which attained new postwar highs at the end of the year. Despite the general over-all decline in prices during the year, the wholesale price index was slightly more than 100% greater in Dec. 1949 than in Aug. 1939; and the consumers' price index was 70% greater than that of Aug. 1939.

Wholesale prices for each major group of commodities shown in Table I, except as indicated below, reached their postwar highs in 1948: farm products, chemicals and allied products and the miscellaneous group of commodities in January; textile products in April; food in August; building materials in September; fuel and lighting materials in November; and housefurnishings in December. Only hides and leather products and metal and metal products reached their peaks other than in 1948, the months being respectively Dec. 1947 and Jan. 1949.

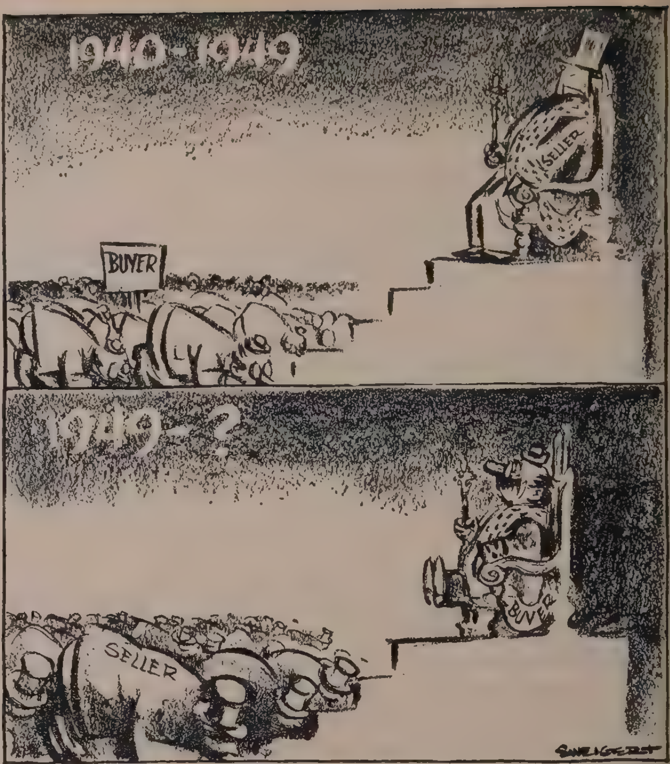
Table I.—*Per Cent Increase in Wholesale Prices, by Major Commodity Groups, United States, Prewar Prices to Postwar High Points*

Commodity group	High post World War II increase from Aug. 1939*	High post World War I 1920 increase from July 1914
All commodities	126	148
Farm products	227	138
Foods	182	137
Textile products	122	252
Fuel and lighting materials	90	277
Metals and metal products	88	99
Building materials	128	218
Hides and leather products	119	192
Chemicals and allied products	87	123
Housefurnishing goods	73	164
Miscellaneous	69	102

*As explained in the text, except for two commodity groups the high point was reached in 1948. The peak month varied with the different commodity groups.

Source: Computed from data published by the bureau of labour statistics of the U.S. dept. of labour. Except as otherwise indicated, all computations presented in this article are based on such data.

As shown in Table I, wholesale prices generally advanced less percentagewise after World War II than after World War I, the notable exceptions being farm products and food prices. The smallest relative increases were registered by three groups, in the following order: fuel and lighting materials, housefurnishing goods and textile products. The only commodity group for which price increases were roughly comparable during both periods was metal and metal products.



GRAPHIC PICTURE, by Sweigert of the *San Francisco Chronicle*, of the reversal of buyers' and sellers' markets which took place during 1949

On the retail level, as reflected by the cost of living indexes of the bureau of labour statistics, the postwar peak in the prices of all items was reached in Aug. 1948 when the index was 77% above that for Aug. 1939. Food prices reached their highest levels in July 1948, and apparel and housefurnishings in October. The prices of the remaining three items in the cost-of-living index—rent, fuel, electricity and refrigeration, and miscellaneous—continued to rise to new highs at the end of 1949.

Table II.—*Per Cent Increase in Cost of Living (Consumers' Retail Prices), by Major Items, United States, Prewar Prices to Postwar High Points*

Item	High post World War II increase from Aug. 1939*	High post World War I 1920 increase from July 1914
All items	77	101
Food	132	126
Apparel	101	176
Rent	17	51
Fuel, electricity, etc.	43	49
Housefurnishings	98	†
Miscellaneous	55	82

*For all items the high point was reached in August, for food in July, for apparel in October, and for housefurnishings in October—all in 1948. The high for each of the other three items was attained in Dec. 1949.

†Not available.

Source: Computed from data published by the National Industrial Conference Board for the years 1914–20 and the bureau of labour statistics for the period beginning with 1920.

When compared with the increases in the cost of living during the World War I period (*see* Table II), the price rise for all items was not as severe during the World War II period—77% as against 101%. Only in food (which, however, is a sizable item in the budget of a moderate-income family for which the cost of living index is computed) was the price increase in the later period greater (132% compared with 126%); in rent the increase was one-third as great and in apparel less than two-thirds as much.

As shown in Table III, wholesale prices for all commodities were, at the end of 1949, 102% greater than in Aug. 1939, 62%

greater than at the start of the war in Dec. 1941, and 34.3% greater than at the ending of price controls in June 1946. However, wholesale prices had declined 6.7% during 1949. The downward trend was continuous throughout the year except for two slight upturns in March and September. At the beginning of the year, prices dropped 2.6%, largely as a result of heavy nventory liquidations, which were carried out in an orderly manner. The return to a shorter work week, cutbacks in production and high levels of consumer expenditures prevented a greater decline in industrial and raw material prices, and government support programs prevented a greater decline in the prices of farm products and foods.

Table III.—*Per Cent Change in Wholesale Prices, by Major Commodity Groups, United States, Selected Periods, 1939–1949*

Commodity	Per cent change Nov. 1949 from Post-war high	Dec. 1948	June 1946	Dec. 1941	Aug. 1939	Postwar high from Dec. 1948	Dec. 1948 from Dec. 1947

Consumers' prices, which levelled off during 1948, fluctuated sporadically during 1949, and at the end of the year were 2.3% lower than at the end of the previous year. Retail prices were still 25.7% above the June 1946 level, at which time price controls were removed, 51.6% above the level of Dec. 1941, and 69.9% above the Aug. 1939 level.

Declines in the prices of food, clothing and housefurnishings more than offset the increases in other consumers' prices shown in Table IV.

Table IV.—*Per Cent Change in Consumers' Prices (Cost of Living), by Major Commodity Groups, United States, Selected Periods 1939–1949*

Commodity	Per cent change end of 1949 from Post-war high	Dec. 1948	June 1946	Dec. 1941	Aug. 1939	Postwar high from Dec. 1948	Dec. 1948 from Dec. 1947

Fuel, electricity and ice .	0.0	+1.4	+26.4	+34.2	+ 43.3	+1.4	+7.8
Housefurnishings	−6.7	−6.6	+18.8	+58.8	+ 84.4	+0.1	+3.8
Miscellaneous	0.0	+0.8	+21.4	+44.2	+ 54.7	+0.8	+6.6
All items.	−4.0	−2.3	+25.7	+51.6	+ 69.9	+1.8	+2.6

The most important single item in the consumers' price index is food. Had retail food prices declined during the year as much as wholesale food prices, the cost-of-living index would have been lowered substantially. Table V, showing monthly changes in the various groups comprising the cost-of-living index, indicates the importance of the two items, food and rent. The three peaks attained by the index of all items during the year—those in April, June and September—largely reflect sudden upturns in the prices of food and rent.

The downward trends of wholesale and retail prices during 1949 are summarized in Table VI and in the chart below.

Some of the decrease in wholesale prices resulted from the reduction in exports caused by dollar shortages abroad. Since foreign demand in the postwar years was largely for commodities which were in shortest supply, this demand had a very strong influence on domestic prices. The decrease in exports largely reflected the revival of foreign economies on the one hand and inability to pay for imports from the United States on the other. The devaluation of foreign currencies during the year also exerted downward pressure on wholesale prices since in most cases devaluation abroad did not lead to a proportionate increase in prices of foreign exports to the United States. Other factors which tended to have a depressing effect upon prices were inventory liquidations, the overcoming of nearly all shortages in strategic raw materials, the decline in new plant expansion and competitive pressures. Factors tending to sustain high prices were the continued high-level government and individual expenditures, temporary scarcity of commodities where output was curtailed by labour disputes, rent decontrol and foreign demands subsidized by the United States. In general, the continued high levels of wholesale and consumers' prices were sustained by the continued high level of economic activity in the United States which was buttressed by large government expenditures for national defense, foreign aid and farm price support programs. (*See* also Income and Product, U.S.)

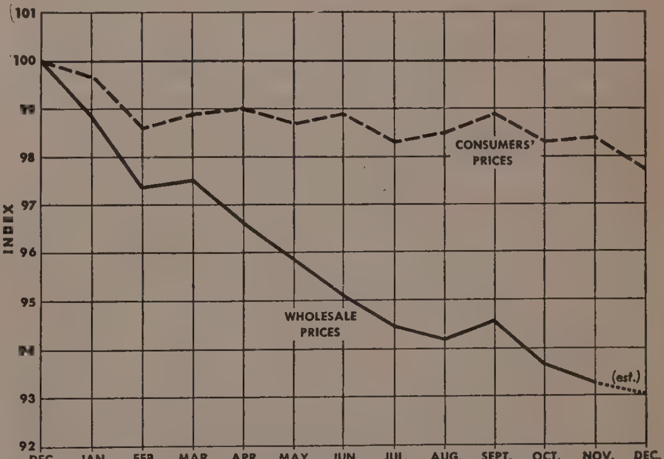
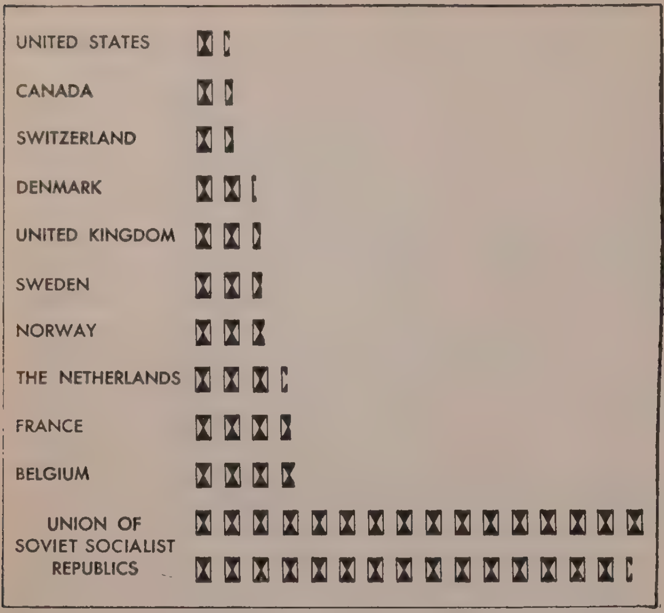
(W. V. Wr.)

Great Britain.—The course of prices in the United Kingdom in 1949 was dominated by the devaluation of sterling in September. The upward movement in prices had been general and continuous from the end of World War II until the middle of 1948.



WHOLESALE AND CONSUMERS' PRICES in the United States, Dec. 1948-Dec. 1949 (Dec. 1948=100) (Source: U.S. Department of Labor, Bureau of Labor Statistics)



WORKING HOURS required to buy a pair of shoes, by countries. Each hour glass represents eight hours of work at the average rate of pay in the manufacturing industries (Source: Department of Commerce)

The rise in prices was then halted, and during the following 12 months prices were generally stationary or falling. A slow but definite downward movement in general price levels (apart from adjustments in subsidies and taxation) was the characteristic feature of the middle months of 1949. This trend was violently changed by devaluation. Although only partial and immediate effects were reflected in price index numbers by the end of 1949, the prospects then were for continued and (in some sectors) large price increases for many months to come.

The downward movement in prices during the months before devaluation in Sept. 1949 was most clear in prices of imports. Early in 1949, import prices stood at a level three times that of 1938; at the time of devaluation they had been lowered by more than 5%. Prices of imported foodstuffs declined equally with raw material prices. The prices of United Kingdom exports remained firm during this period of falling import prices. As a result, the decline in the prices paid for imports was matched by an improvement in the terms of trade. At the end of 1948, terms of trade were almost 20% less favourable than in 1938; by the time of devaluation in 1949 this differential had been reduced to little more than 10%.

The trend of domestic prices was less easy to follow since the prices were affected by changes in subsidies, in indirect taxation and in controls. Prices received by domestic farmers, inclusive of all government payments, were largely a matter of agreement between the farmers and the government; apart from seasonal variations, they did not differ much between 1948 and 1949. Prices of commodities, both at wholesale and at retail, were affected between April and June by a set of adjustments, following the budget and the declared policy to limit the total amount of subsidies and trading losses by the government. The main adjustments were in iron and steel prices and in the prices of some basic foods—meat, butter, margarine, cheese and eggs. There were also budget changes, particularly in the prices of beer and matches.

Among wholesale prices, the group of prices of basic foodstuffs (cereals, meat, fish and dairy produce) was increased from 50% to nearly 75% above 1938. This was almost entirely the result of the limitation of subsidies. Similarly, iron and steel prices, under governmental control, were adjusted to give an average increase from less than 70% to more than 85% above 1938. In addition, prices of industrial materials declined fairly rapidly in the first nine months of 1949, and food prices at wholesale showed no more than normal seasonal changes (*e.g.*, in fruit and vegetable quotations). The general index of wholesale prices at the beginning of 1949 was 218% of 1938, practically the same figure as at mid-1948. In Aug. 1949 the recorded index was 225% of 1938, but elimination of the effect of adjustments in prices of iron and steel and of subsidized foods would reduce the figure to about 210% of 1938. This figure was comparable with the index at the beginning of the year, indicating that the underlying movement in wholesale prices was downward. The fall amounted to about 3% or 4% in eight months and was mainly the result of declining prices of nonferrous metals, textile materials and other (nonfood) agricultural and forest products.

The adjustments in subsidized food prices raised the index of retail prices of all foods from 50% to about 60% above 1938. The index of all retail prices, affected also by the reduction in the price of beer and the increase in the price of matches following the budget, was raised from about 175% of 1938 to nearly 180% of the prewar level. Otherwise the general level of retail prices remained almost unchanged during the nine months before devaluation.

By the end of 1949, recorded index numbers of prices reflected the consequences of devaluation to a limited extent. The longer-run effect of devaluation, to be expected during 1950, could only be roughly guessed.

Europe.—As in 1948, the greatest stability in prices, both at wholesale and at retail, was in the Scandinavian countries, and the movement was very slight. In the Netherlands, wholesale and retail prices rose toward the end of 1948 but became more stable in 1949. The two countries with hard currencies, Belgium and Switzerland, experienced a considerable amount of deflation, and prices declined in 1949, particularly at the wholesale stage. Of the two main countries where inflationary pressure was strongest, France was the more successful in controlling prices. In Italy, although there was no repetition of the inflation experienced up to 1947, prices were by no means stable. Prices fell and then rose again in 1948, with some reaction in 1949.

British Commonwealth.—The movement of prices in countries of the British Commonwealth of Nations was similar to that in the U.S. or the United Kingdom. Both wholesale and retail prices reached a peak in the middle or during the second half of 1948; the trend was subsequently stationary or downward until the devaluation of sterling in 1949. Price declines were most evident in Canada, India and Pakistan. In Australia and South Africa, there was a greater stability in price levels, and price rises were slightly more numerous than price falls after the middle of 1948. (*See* also Agriculture; Business Review; Consumer Credit; Food Supply of the World; Stocks and Bonds; Wages and Hours; and articles on individual commodities.) (R. G. D. A.)

Primary Education: *see* Education.

Prince Edward Island. Smallest province of Canada, 2,184 sq.mi., Prince Edward Island lies in the Gulf of St. Lawrence nine miles from the mainland. Pop. (1941) 95,047; (1949 est.) 94,000. Provincial cap.: Charlottetown; pop. (1941) 14,821.

History.—Important legislature of 1949 included: a new workmen's compensation act modelled closely on the Nova Scotia act; repeal of the controversial 1948 act which had required all labour unions to be provincially autonomous, and which had required all employees to be provincial residents; payment of allowances for the first time in provincial history to needy mothers, if husbands were incapacitated or had deserted;

extension of apprenticeship act to cover garage mechanics. The 1937 law banning sale of margarine was brought into force by proclamation.

The public accounts for the fiscal year ending March 31, 1948, were reported early in 1949. They showed total ordinary revenue of $5,231,699 and an actual surplus on current account of $355,990. Tabling the 1949–50 budget in March, the government announced expected island revenues of $5,961,605, and expected expenditures of $7,402,640, which would increase the public debt by about $1,000,000. Main 1949–50 expenditures: health and welfare, $2,000,000; public works, $800,000.

Education.—The 1949–50 budget allocated $840,000 for education. Latest revised statistics were for 1946 provincially controlled schools: total enrolment, 18,085; average daily attendance, 14,321; teachers, 668; total revenue, $642,357.

Communications and Travel.—To help boost the tourist trade, the government voted nearly $2,000,000 for 1949–50 highway expansion. To complete dieselization of the island's railways, 18 diesel-electric locomotives were put on order by the Canadian National Railways. Tourist trade for 1948 was valued at $40,000,000, with 12,000 more visitors than in 1947.

Agriculture.—Crops during 1949 were better than average, with potato shipments during the first nine months almost double the shipments for the same 1948 period. Dairy production for 1948 included 4,500,000 lb. of creamery butter, which was 22% over 1947 production. In 1948, 50,000 ac. of potatoes produced about 10,000,000 bu. but they sold for about $3,000,000 less than the smaller 1947 crop of 43,500 ac. Cheese production for 1948 reached 706,000 lb., 6% over 1947. Chick production fell to 486,000 against 616,000 in 1947.

Fisheries.—Successful shipment of live lobsters in cans was continued and there were expectations that the 1949 harvest would exceed that of 1948 which had in turn been 360,000 lb. greater than for 1947. Although 1948 fish landings were down to 33,000,000 lb. compared with 37,358,000 lb. in 1947, the 1948 values were $310,000 higher than 1947 values of $1,880,000. The 1948 oyster catch was 669,000 lb. greater than that of 1947. (C. Cy.)

Principe: *see* Portuguese Colonial Empire.

Printing.

Announcements of phototypesetting mechanisms continued during the year 1949. One, unofficially named Lumitype, was designed for book, magazine and newspaper composition. Public demonstrations of a laboratory model were held by Graphic Arts Research foundation. The machine was the invention of two French communications engineers, René A. Higonnet and Louis Moyroud. Joined with the foundation were Vannevar Bush and Samuel Caldwell. Bush was the inventor of the telephonic relay system which is employed in a limited manner in the phototypesetting machine.

There are five basic parts: (1) an electric typewriter, (2) a memory unit, (3) a counterjustifier which is an electrical computing and control system, (4) an automatic photographic unit, and (5) an automatic stripping machine. The typewriter types characters on paper just as is done on the conventional machine; also, as each character is typed its set-width is coded and stored in a memory device. The system used is based on units of 0.01 in. (actually two-tenths of a millimeter). Thus, as each line is typed an indicating dial records by increments progressively the units occupied by letter characters and the word spaces. Having typed the maximum number of words which will go into the line, the operator depresses a special key. Switching elements in the counterjustifier add the number of units required for words and spaces between words. The total number of units is subtracted from the maximum number of units required to fill the line. The excess space required to fill the line to constant width is then automatically distributed evenly between the words.

The counterjustifier then sends its signals to the automatic photographic unit. In the photographic unit is a continuously revolving vertically positioned glass disk six inches in diameter. Inset radially through the disk are photographic negatives of all the letter characters in the usual type font. Set at right angles to the disk is a high-speed stroboscopic lamp which emits flashes of two-millionths of a second duration. The lamp rays arrest the movement of the negative letter character in the revolving disk during exposure to the film. At the other side of the disk and also at right angles to it but in line with the apertures in the whirling disk is a lens system and the sensitized film. When an impulse is created by one of the coded characters a beam of light, triggered by a photoelectric cell, passes through the selected negative in the whirling disk into a lens system focused on the photographic film. Letter characters are photographed on the film at six exposures per second. After development, the film can be printed down on sensitized or Ozalid paper for proofreading.

The automatic stripping mechanism makes corrections in previously composed matter, inserts folios, page numbers and running heads and automatically photographs a new film all ready to be used by the platemaker. The proofreader's corrections are made on a new film and a code mark is placed at one side of the line or lines containing errors on the original film. The original film and corrected film are fed into the stripping machine simultaneously. The machine photographs a new film from the original composition until one of the code signals indicated by the proofreader tells the machine to shift to the corrected film. After the corrected line or lines have been photographed on the new or third film, the stripping machine is shifted back to the original film. Operation is at a speed of ten average-width lines per second.

Introduction of the Hadego Photocompositor invented by Ir. H. J. A. de Goey, Haarlem, Neth., for display line typesetting in negative or positive film form was made. With the exception of the photographic operation, the machine is based upon the principle of the U.S. Ludlow hot-metal machine. Matrices consist of 48-pt. white letter characters upon a black background affixed to clear plastic blocks. Letter characters are assembled like hot-metal matrices in a stick; the stick containing the line is placed before the camera and the exposure is made. Letter characters may be reproduced photographically on the film down to 19 pt. or up to 115 pt. Leading between lines on the film may be obtained from 0 to 24 pt. The film holder carries a film 11½ in. by 16 in.

An announcement of the Justowriter was made. This equipment eliminates the necessity of manually retyping lines to obtain equidistant line length. It consists of two units, an electric typewriter and an automatic retyping machine. The product of the latter is evenly justified lines of type matter in column form ready for use by the platemaker. When typing matter initially, the operator leaves the right-hand margin unjustified with respect to uniform line length. In addition to typing lines on paper as is done on the standard typewriter, the machine on which initial typing is done produces a punched tape, similar to Teletypesetter tape. When composition has been finished, the tape is inserted in the automatic typing machine which produces typed copy with lines of equidistant line length with spacing between words.

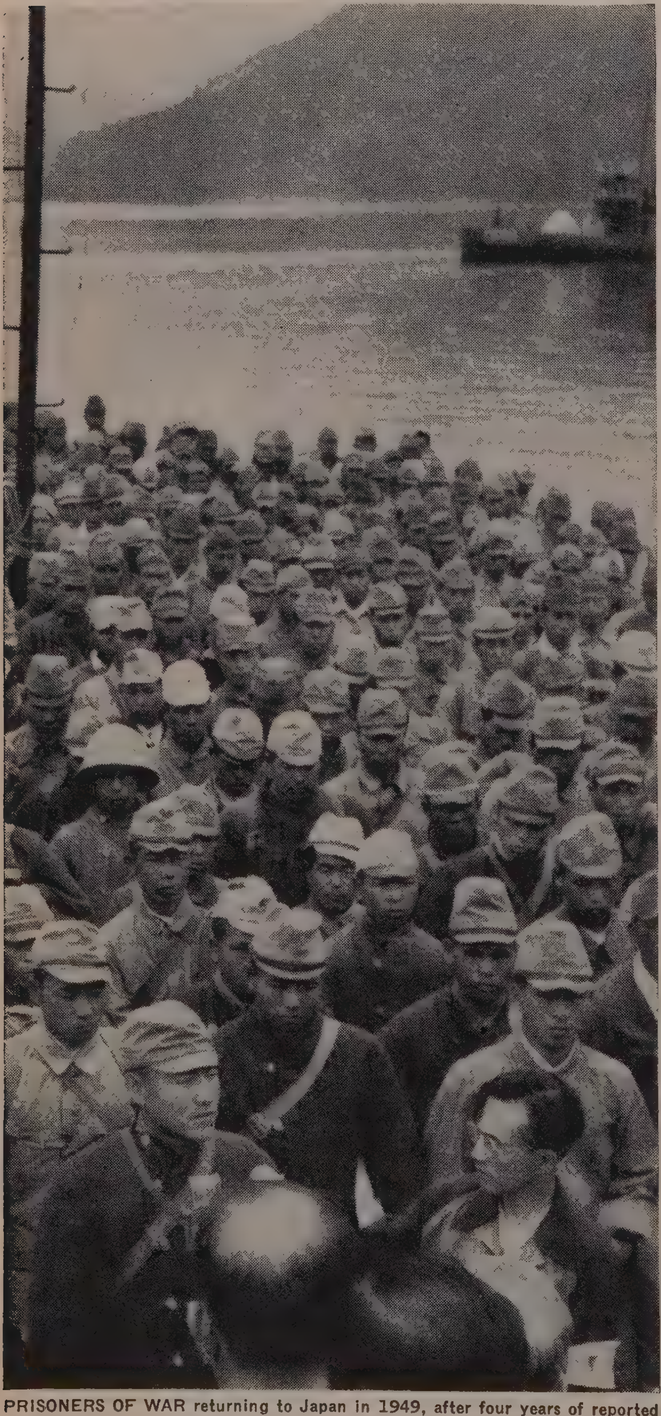
An early technical problem in photomechanical platemaking was the conversion of a black and white photograph in a colour process set of plates. With the Flexichrome process announced in 1949, this work would revert in many instances from a highly skilled etching process to one of semiart and photographic method. In other words, it is a copy preparation method. The black and white photograph to be reproduced in colour is photographed to the wanted size on a sheet of special stripping film. The film is developed and fixed; it is then put through baths which bleach out the silver image, dye and swell the film gelatine surface, after which the film is mounted on a paper support. Colour is applied by an artist similarly to colouring a photograph. Colour is blobbed on the gelatine film. Colouring a Flexichrome print actually is a matter of good colour selection rather than skilful application. In the processing, the gelatine on the film takes on various heights or thicknesses. The varying thicknesses of gelatine absorb the colour medium in varying amounts. A colour may be changed after it has been applied and retouching with colour art mediums may also be used on the print for colour improvement. After the photograph has been coloured, it is ready to be colour-separated by the photo-engraver or offset-lith platemaker by the usual methods.

Films of 1949.—*Here's How We Print* (H. A. Klein). (M. Si.)

Prisoners of War.

Albania, Poland and the U.S.S.R. alone of all the nations which participated in World War II still retained prisoners of war at the end of 1949. The total number was not known but was estimated to exceed 1,000,000.

France completed repatriation of all prisoners of war held by that country in metropolitan France, the French zone of Germany and North Africa on Dec. 31, 1948. However, approximately 130,000 former prisoners remained as civilian workers, and a certain number still were held for legal reasons.



PRISONERS OF WAR returning to Japan in 1949, after four years of reported Communist indoctrination in the P.O.W. camps of Siberia, U.S.S.R.

Yugoslavia announced that there were no longer any prisoners of war in that country. As in France, a certain number remained as civilian workers, and others were held for legal reasons.

Czechoslovakia completed its repatriation of prisoners of war in 1949.

Poland, which held 40,000 prisoners of war at the end of 1948, still retained several thousand whose repatriation was promised by the end of 1949.

Albania held throughout 1949 the 250 prisoners of war it reported in 1948 without any indications as to when they would be repatriated.

The U.S.S.R. repatriated a certain number of both German and Japanese prisoners of war during the year, but the total number repatriated and the total number of prisoners of war still held by the U.S.S.R. was not known. Steps taken by various governments and by the International Red Cross to hasten repatriation of these prisoners brought responses that repatriation was being effected as rapidly as possible.

Representatives of 58 nations (including the U.S.S.R.) meeting in Geneva, Switzerland, April 21–Aug. 12, 1949, completed the revision of the 1929 Prisoner of War convention. Twenty-nine states signed the revised convention in Geneva on Dec. 8, 1949, and during the following few weeks, 22 others deposited their signatures. (*See* also Red Cross.) (H. W. Dg.)

Prisons.

During 1949 the state of New York reopened Greenhaven, a maximum security prison which the army operated during World War II. In Ohio plans were initiated for the construction of a new reformatory and two additional units at the state hospital, one for defective delinquents, the other for psychopaths. In Massachusetts sufficient money was appropriated to build a modern state penitentiary to replace the century-old Charleston prison, which had long been condemned.

California opened a new medium security prison at Soledad and a combined medical and reception centre in Vacaville, in the northern part of the state. In southern California, a reception centre was started at Chino. The state also announced plans for a new women's institution and a special institution for youthful offenders. Virginia reported that it would erect a medium security prison of the farm type in the near future.

Utah started to build a new prison which was to be completed in 1950. Idaho opened its first parole camp, which has a twofold purpose: to aid men who will soon be paroled and to develop Idaho's lands near St. Maries. Selected prisoners, supervised by parole officers, not guards, are thus prepared to bridge the gap between the routine life of the prison and the free community. The federal prisons, also emphasizing preparation for parole, began to allow some prisoners to live in special quarters set up within an institution and to wear civilian clothes. In addition, the federal bureau of prisons started a program under which public spirited citizens would offer constructive guidance to released inmates.

In Texas, more than $4,000,000 was appropriated for the improvement of the state's correctional system. Construction work started in April. The Huntsville prison was remodelled, a textile mill was erected and laundries and bathhouses were set up at the institutions located in Wynne, Goree, Darrington, Retrieve, Clemens and Harlem. More important, the prison farms were modernized and considerable equipment was purchased.

In Michigan, under a new program inaugurated in May, each mate at the Jackson prison was assigned an adviser. As a esult, every man within the walls acquired a personal link with l administrative functions of the institution. Counsellors were iven office space readily accessible to inmates, and they could herefore understand administrative procedures more clearly nd discuss personal problems in a friendlier atmosphere.

New Jersey opened the first unit of its new diagnostic centre here ample facilities were provided for the examination of wbreakers and other maladjusted persons. At the reformatory Bordentown, a project believed to be unique in the annals f U.S. penology, proved successful. Ten inmates completed a ourse of study in Braille and continued their education. New ersey also further developed and experimented with the use f group psychotherapy, a rehabilitative procedure which proved promising that it was being practised in other states.

(S. A. L.)

Great Britain.—In England and Wales overcrowding and nderstaffing continued through 1949. The daily average prison opulation remained about 20,000, almost double the prewar gure. Two more prisons were opened, at the Verne, Portland, or Star class prisoners and at Eastchurch, Kent, for civil risoners and short-sentence Stars; in both open camp conitions obtained.

The statistical results of the system reported in 1949 showed slight improvement. Of those who from 1930 to 1945 came prison for the first time for offenses serious enough to warant the taking of fingerprints, the percentage of reconviction t the end of 1947 was below 20% for ordinary prisons and bout 10% for special training prisons.

The Borstal system, less affected by overcrowding or underaffing, maintained its steady recovery from war and postwar ifficulties along established lines. Vocational training was exanded to some 50 classes in a dozen trades. Week-end home eave for boys was reintroduced. Statistical results showed that, p to Dec. 31, 1948, of those discharged during the years 942–46 about 74% of boys and 81% of girls had not reverted crime.

The most important event of 1949 was the coming into force f those sections of the Criminal Justice act, 1948, which diectly affected the prison system. The abolition of penal serviude, hard labour and the triple division of imprisonment left nly the single sentence of imprisonment for all offenders not ealt with as persistent offenders: for these the act provided wo forms of sentence; viz., corrective training (2–4 yr.) and reventive detention (5–14 yr.). The restrictions on the imrisonment of persons under 21 resulted in a fall in the young risoner population, enabling the closing of two more young risoner centres. Young prisoners with sentences of three onths or over were now released on a conditional licence. In onsequence, the prison system was substantially reorganized. here were now local prisons (reception and short term), egional prisons (special training of selected prisoners) and entral prisons (long term), including six open prisons.

Scottish prisons did not suffer from overcrowding, the poputtion remaining 20% above 1938 level. The Scottish Advisory ouncil on the Treatment and Rehabilitation of Offenders pubshed a far-reaching report on the Scottish prison system. *See* also Crime.)

Propaganda. The outstanding propagandas of 1949 were those of the "cold war" between the Union of Soviet Socialist Republics and the United States of America, their allies and *de facto* allies. The latter included the Russian Orthodox Church, which gave God's blessing to the Soviet Union and communism as, in the days before 1917, it had given God's approval to the Russia of the czars; and the Roman Catholic Church, which saw communism and the Soviet Union as deadly evils and conveyed God's blessing to nations opposed to them.

The "cold war" began in the closing days of World War II. It expressed the determination of the Soviet Union and the United States to hold the gains in territory, military potential and influence they had achieved in World War II. Historically, the "cold war" was not new; it was a resumption of the hundred years' war of the competing propagandas of capitalism and communism which had begun a century earlier, when Karl Marx and Friedrich Engels had issued their *Communist Manifesto.* This potent propaganda pronouncement had offered high standards of living and freedom from oppression and discrimination to all the workers and races of the world.

On Sept. 5, 1949, according to the Associated Press, Harold MacMillan, British conservative, read to the European Consultative assembly at Strasbourg, Fr., a memorandum which he said Winston Churchill had sent to the British war cabinet in Oct. 1942, urging the unification of Europe as a barrier against "Russian barbarism."

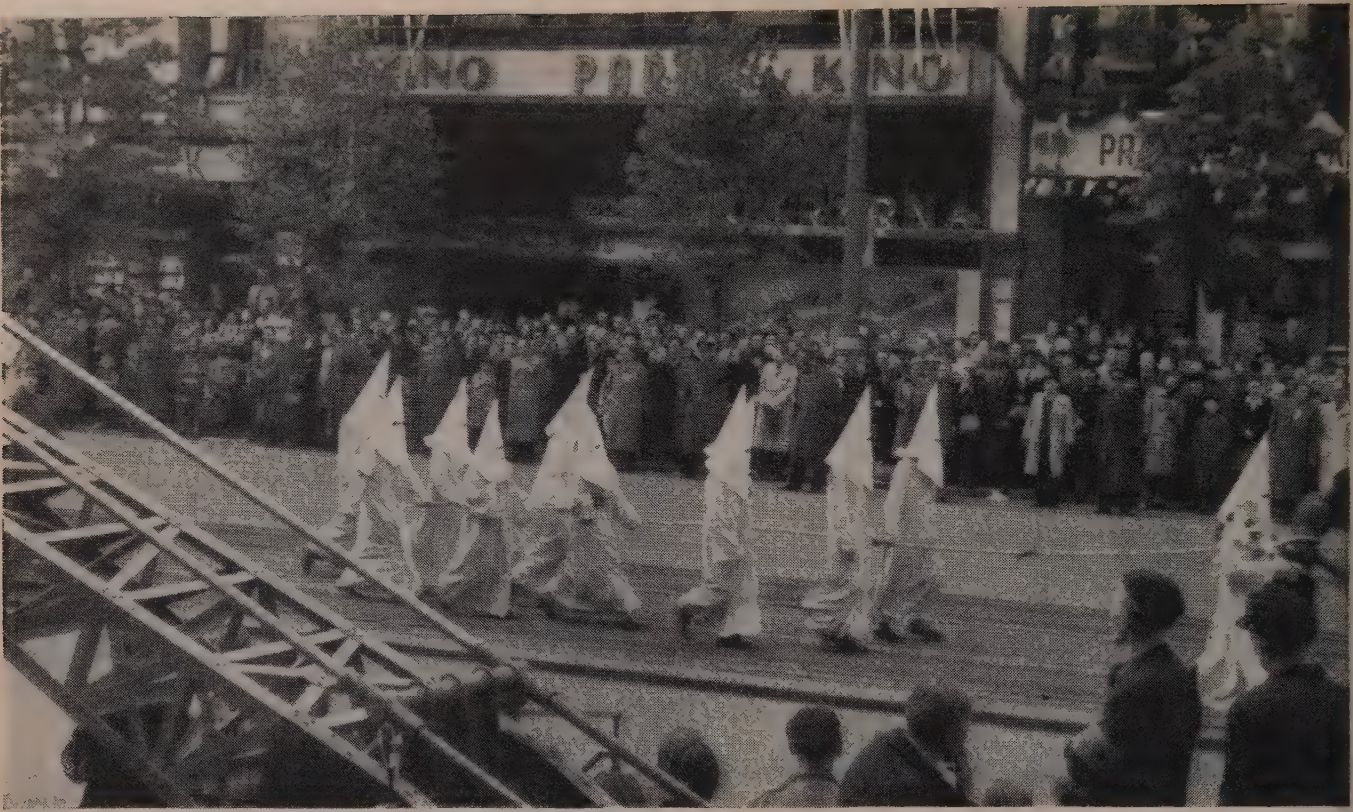
"Cold war" allies and *de facto* allies of the Soviet Union in 1949 included the new Communist states of eastern Europe (with the exception of heretical Yugoslavia), eastern Germany, Communist China and north Korea, Communist parties throughout the world and the Russian Orthodox Church.

Allies and *de facto* allies of the United States included Great Britain with its Socialist government; the capitalist nations of western Europe, including western Germany, and the Vatican state which, through the Roman Catholic Church with its 400,000,000 members, was especially powerful in the ideological war, for it was able to influence policy making in the U.S. and its allied nations, and to disseminate counterpropaganda in the new Communist states.

Both the U.S.S.R. and the United States had effective propaganda machines. That of the U.S.S.R. was described in Nov. 1949 by Gen. Walter Bedell Smith, former ambassador to the Soviet Union, as follows: "For an American to appreciate the volume and effect of Soviet propaganda, it is necessary for him to remember that the government owns and controls *all* media of information—newspapers, books, magazines, radio, ballet, theaters, motion pictures and . . . television. The government uses these media without limitation to create and change public opinion, both at home and abroad, and to these have been added . . . all media of information in the satellite countries. . . . The vast propaganda machine, since the Spring of 1946, has made the United States and Great Britain in particular and Western civilization in general, the object of a campaign that in viciousness and intensity is without parallel in time of peace. As directed against the United States . . . we are depicted as the virtual heirs of what the Soviet propagandist calls 'the maddened, rapacious Fascist beast.'" (*My Three Years in Moscow,* J. B. Lippincott Company; published also by William Heinemann, Ltd., London, Eng., as *Moscow Mission 1946–49.*)

Within Russia, General Smith wrote, the Kremlin's propaganda offensive was devoted largely to destroying the reservoir of good will for the United States that was created in the Soviet Union during the war and the long-standing admiration felt by the Russian people for U.S. industrial and scientific progress.

By the close of 1949 the anti-Communist propaganda machine



SAMPLE of the propaganda used by Communists in Czechoslovakia in 1949. Hooded Klansmen are shown holding a Negro in chains (extreme right) during a political parade staged to illustrate life in the United States

in the United States approached that of the Soviet Union in efficiency of dissemination, in name calling and in political acts calculated to inspire fear, ensure conformity and prevent counterpropaganda. It had the co-operation of all the major news services, most of the newspapers, all of the major broadcasting companies, the motion-picture industry, the chamber of commerce of the United States, the American Federation of Labor and the Congress of Industrial Organizations, veterans' organizations, most schools and universities and the Roman Catholic Church. To the media available in the United States had been added those of the Marshall plan and North Atlantic treaty nations.

Within the United States, propaganda efforts were likewise devoted to destroying the reservoir of good will for the Soviet Union created in the U.S. during the war. The attorney general of the United States was authorized to make public the names of organizations he considered subversive. In June 1949 the Educational Policies commission of the National Education association declared that all Communists should be excluded from employment as teachers; in Oct. 1949 Japan was purging teachers charged with being "red" at the behest of the United States. Propaganda to discredit the Roosevelt administration and the Yalta agreements for soviet-United States postwar co-operation continued through the year. In December radio commentator Fulton Lewis, Jr., charged that in 1943–44 Harry Hopkins, with the help of Henry A. Wallace, had shipped uranium to the U.S.S.R. This was but another incident in the "cold war" record of spy hunts, purges and political trials, and diplomatic "tough talk." Political trials which had served the Soviet Union for years as propaganda weapons were frequent and spectacular in 1949. For example, in the United States 11 leaders of the Communist party were convicted of having conspired to teach and advocate the overthrow of the United States government; and Alger Hiss, state department official in the Roosevelt administration, was being tried in December, accused of having sworn falsely that he was not a Communist, had not given secret documents to Communist spies. (Hiss was convicted in Jan. 1950 and sentenced to five years' imprisonment. The verdict was appealed.)

In Communist China, U.S. consular representatives were imprisoned, tried on vague charges and ordered deported. In Hungary Laszlo Rajk, the former premier, received the death penalty for plotting with foreign agents, and Joseph Cardinal Mindszenty, charged with treason, received life imprisonment. Trials of Catholic priests and church dignitaries in eastern Europe to curtail Vatican influence in government and education were a prelude to the Vatican's decree of excommunication, issued July 13, 1949, against Catholics who became Communists or who aided communism. On Nov. 17, addressing members of the U.S. senate military appropriations committee, Pope Pius XII supported the U.S. arms program for western Europe and singled out the Soviet Union as responsible for the fear of war.

In neither the United States nor Great Britain was approval of the "cold war" unanimous. The *Wall Street Journal* saw in the huge arms program of the United States a parallel to Hitler's guns-instead-of-butter economy. James P. Warburg, U.S. economist, urged reduction of military expenditures and advocated that communism be stopped not by trying to contain it by physical force, but by promotion of economic recovery and social justice. The American Society of Friends made public a study of U.S.-soviet relations with suggestions for peaceful settlement of differences. U.S. publicists Scott Nearing and Lawrence Dennis, differing widely in ideology, saw exploitation of the fear of communism and Russia as a propaganda device for making "welfare states" of both Britain and the United States, after the pattern of Germany's national socialism.

U.S. church groups who were alarmed by the growing influence of the Roman Catholic Church, particularly in education and in the making of national policies, in 1949 completed organization of Protestants and Other Americans United for Separation of Church and State. The American Civil Liberties union in its 1949 report declared that the "cold war" and its propaganda had placed civil rights in greater danger than at any other time in the 29 years of the union's existence.

Citing the mounting hysteria, Robert M. Hutchins, chancellor of the University of Chicago, said in a convocational address: "We ought to be afraid of some things. We ought to be afraid of being stupid and unjust. We are told we must be afraid of Russia, yet we are busily engaged in adopting the most stupid and unjust of the ideas prevalent in Russia, and are doing so in the name of Americanism. The worst Russian ideas are the police state, the abolition of freedom of speech, thought, and association and the notion that the individual exists for the state." Hutchins added that labelling a thing or a person Communist because Communists happen to favour it or agree with him involves the negation of thought of any kind.

In England, in March 1949, complaints were being made against the dean of Canterbury, Hewlett Johnson, for advocating friendly relations with the U.S.S.R. The archbishop of Canterbury, Geoffrey Francis Fisher, when asked why he did not remove the dean from his post, said: "In this country we greatly value the right of freedom of speech. . . . Its suppression is one of the grave charges against those totalitarian and police states which enjoy the Dean's confidence."

By autumn of 1949 it appeared that "cold war" propaganda was not likely to "contain communism" or end capitalism, and that a "hot war" threatened catastrophe to west and east alike, what with the Communist victories in China and the U.S.S.R.'s probable possession of atomic weapons and bacteria bombs. Anne O'Hare McCormick, writing in the *New York Times*, declared that the real "iron curtain" was the profound distrust that existed between the U.S.S.R. and the western powers; that the one way to prevent war was "to create a modicum of confidence between the two big powers."

Neither Russian nor U.S. propaganda was creating that confidence. "Letter from Warsaw" in the *New Yorker* magazine of Oct. 22, related that the "Voice of America" broadcasts offended both Communists and non-Communists. James Reston, Washington, D.C., correspondent, wrote in the *New York Times* of Oct. 27 that the blunt language of U.S. diplomacy was sounding slightly "like a stuck whistle."

Most Communist propagandas seemed equally ineffective in the United States.

One Communist propaganda, however, that advocated that people in nations everywhere follow the Soviet Union's example in ending racial discrimination was not increasingly effective the world over—not primarily because it was soviet propaganda, but because it was Christian doctrine and soviet practice. U.S. failure to end the disparity between its preachment of "liberty and justice for all" and its practice with respect to racial discrimination was widely utilized by the Soviet Union. Such events as the Peekskill riots of Sept. 1949 were publicized by Communists (and by many non-Communists) to reveal a major U.S. weakness. To meet such propaganda, President Truman had repeatedly asked congress to adopt a civil rights program. Congress adjourned until 1950, with no action taken. Meanwhile, however, local programs to end discrimination on the basis of racial or religious difference, such as the one evolved by a group of eminent U.S. educators in Springfield, Mass., during the war years, were being adopted in communities throughout the United States. One effect of anti-Communist propaganda in the United States which linked the names of respectable and influential citizens of high prestige to Communist fronts, real or alleged, lay in the fact that Communists could point to the association with soviet ideals of many eminent Americans. This represented prestige by association (prestige for the Communists), as well as guilt by association.

FILMS OF 1949.—*Propaganda Techniques* (Coronet Instructional Films). (C. R. MR.)

Protestant Episcopal Church.

The most significant event in the history of this church during 1949 was the meeting of the general convention, its supreme legislative body, which convenes once every three years. The outstanding action of this convention was the authorization of a budget for the National council (the executive body), totalling $5,500,000 per year for the ensuing triennium, of which $500,000 was for world relief. To this latter cause the church had given more than $1,000,000 per year, or a total of $3,500,000, for the triennium ending in 1949.

The budget authorized in 1949 represented an increase of $2,000,000 per year. Most of the increase was to go to the overseas department, which supported missionary work in 27 dioceses and districts located in 19 countries; to the home department for domestic missions; and to the department of Christian education. The work of the church throughout Latin America had grown steadily, as illustrated by the fact that in southern Brazil the one missionary district was divided into three, each having its own bishop.

According to the *Living Church Annual, 1950*, the church during 1949 broke several records: church members (all baptized persons), 2,512,265; communicants, 1,671,366; confirmations, 80,021; clergy, 6,547; postulants (those listed by the bishops as desiring ordination), 1,079; lay readers, 5,537; and total contributions, $69,311,977, an increase of $8,200,000 or 13.4%.

Church schools, with 56,641 teachers and 489,423 scholars, increased 6.28% over the preceding year, but had not yet regained their prewar enrolment of 60,000 teachers and 500,000 scholars. Marriages declined (33,667 in 1949 compared with 35,233 in 1948) as did baptisms (104,928 in 1949 compared with 110,618 in 1948).

In spite of having the largest number of clergy in its history, the church was still shorthanded. Parishes and missions increased from 7,864 in 1948 to 7,909 in 1949. However, the theological seminaries were unable to accept all applicants, indicating a still further increase in the number of clergy and the likelihood of the church's being better able to meet in the near future the trend toward expansion. Psychiatry.

A distinct trend in psychiatric thought was seen to develop in 1949, culminating in the awarding of the Nobel prize to two pioneer investigators in the field of physiologic psychiatry. Although emphasis was still placed by most psychiatrists on the psychologic interpretation of mental abnormalities, much of the scientific work of the year was concerned with the basic physical and biochemical reactions of the brain. It was widely recognized that psychologic phenomena ultimately must be based on such reactions, and that if further advancements were to be made they would be along the lines of the physiologic explanation of the function and chemistry of the brain cells and their appendages. Otherwise, psychiatry might tend to become exclusively a field of conflicting philosophic opinions forming a barrier to prevent progressive development much to the detriment of the subject in general. Thus, to put psychiatry and psychodynamics on a firm structural foundation, attention was focused on a balanced program of all inclusive research into the physical causes of mental disease.

Scholars pointed out that with the gradual increase of scientific knowledge the number of mental disorders formerly classified on a functional basis was steadily decreasing. W. B. Terhune estimated that in the standard classifications of 1949 at least three-fifths of mental abnormalities were now accepted as being organic in origin. Many psychoses formerly thought of as functional were attributed to infections, intoxications, trauma, circulatory disorders, convulsive states, faulty metabolism, nutritional disorders, or defects in glandular secretion. Other physical factors were found to influence the psychoneuroses, such as semistarvation or avitaminosis. These causes were particularly potent in colouring the mental state of former prisoners of war and displaced individuals from overrun countries. Many childhood disorders were also shown to be of a physiopsychic nature, and realization came to psychiatrists that psychologic explanations for abnormal behaviour of children as well as adults were not entirely satisfactory without an added evaluation of genetics, constitution and bodily disease processes. Psychiatric illness, like other diseases, began to be recognized as fundamentally structural, psychodynamics describing but not explaining mental disorders. Psychotherapy was thought to be only one way of influencing the physiology of the nervous system; the treatment of bodily disease was considered equally important. Terhune went so far as to conclude that all mental disorders resulted from a disturbance in the normal physiology of both the psyche and the soma with resultant pathologic processes, the whole being greatly influenced by disturbing evironmental factors.

Some of the principal investigations on the function of the brain were carried out by W. R. Hess of Zurich, Switz., a physiologist, winner of one-half of the Nobel prize in medicine for 1949. Hess's later researches had been largely centred on that part of the brain known as the diencephalon, or midbrain, lying on the base of the skull and thus particularly inaccessible to the neurosurgeon. Investigations therefore were confined to animal experimentation. He found that in the diencephalon were grouped nerve cells which have to do with co-ordinating the harmonious interplay of all the organs of the body through the autonomic nervous system. Based on his previous studies of circulation and respiration, Hess re-evaluated the physiologic importance of the diencephalic nuclei as a brain centre of vast usefulness. Of the two divisions of the autonomic nervous system, the sympathetic section appeared to play a decisive part in preparing the individual for activity, while the other section, known as the parasympathetic system, was of importance in relation to economy of action and repair of structures. Both of these divisions, under the control of the nervous central exchange in the diencephalon, exerted their influence both in the psychic field as well as on the bodily organs. By artificially disturbing the equilibrium of the diencephalic nuclei in his animals Hess was able to dampen sympathetic control without interfering with the activity of the parasympathetic centres. Under these conditions, instead of preparing the animal for activity, artificial sleep was produced, thus allowing for better economy and repair through the relaxing of the parasympathetic influence. Psychiatry was therefore furnished with a concrete example of the fact that influences stemming from the diencephalon exerted an influence in activating the psychic function of sleep. Previously the cortex of the brain, the supposed site of the mind, was considered as fundamentally dominating and controlling all bodily processes, a one-way pathway from cortex to lower centres. From the investigations of Hess conclusions were drawn that the co-ordinating centres in the brain stem might in turn influence the psychic functions. These observations were considered by many as fundamental to the concept of physiologic psychiatry. What previously had been suspected in regard to the effect of vegetative processes by way of the autonomic system regulating the activities of the higher cerebral functions was confirmed.

The work of Egas Moniz of Lisbon, Port., was also recognized by the awarding of a Nobel prize. His work, also based on physiologic experimentation, dealt with the relation of frontal lobes, the area of the brain partially concerned with the highest mental processes, to the other parts of the brain. A radical surgical procedure, cutting the connecting pathways, was devised and applied to man. First announced in 1936, this operation, later known as prefrontal lobotomy, had been performed extensively since that date in all advanced centres of psychiatry throughout the world. The evidence presented in 1949 would indicate that the operation, now modified into various patterns, had opened up a whole aspect of brain function and greatly affected psychiatric thought. Psychosurgery, as the whole subject was now designated, is now accepted as a form of treatment, greatly to the betterment of patients with the more serious and prolonged types of mental aberration. Much work on the subject still remains to be done, for the selection of cases most favourable for lobotomy still was considered by most psychiatrists as a puzzling and unsolved problem.

T. O. Caspersson also indicated by his studies on the chemistry of brain cells the answer to some of the most perplexing problems in psychiatry. With the aid of an ultra-violet spectrophotometer he was able to study the protein material within a nerve cell and found a close relation between the function of a cell and its protein formation. Examination of cells from the frontal lobes of persons subjected to the operation of prefrontal lobotomy revealed a decrease in protein substance in those patients who had suffered from severe mental disease. This led to the treatment of certain psychoses, particularly the depressed patient, with stimulants of protein metabolism, such as malononitrile and sodium thiosulphate, with encouraging results. Although still in the experimental stage of investigation, the work of Caspersson was considered provocative and worthy of further research. Psychology.

D. O. Hebb's *Organization of Behavior* attempted to restate some of the facts of psychology in terms of modern physiological theory about the brain. It had been somewhat unfashionable for two decades to talk about the relations of the nervous system to behaviour, and much was written about a science of psychology independent of physiology. Hebb was one of a number who returned to an interest in neurological theory as a source of hypotheses about complex processes like thought, expectation, attention, interest, consciousness and memory. The book starts with the recognition of a number of puzzling facts, such as the observation that great areas of the cerebrum in adults may be damaged or removed without interfering with certain intellectual functions. The neurological theory developed attempts to incorporate this sort of fact as well as the psychological evidence on learning, motivation, emotion, perception, intelligence, thinking and concept formation. The theory assumes that learning consists in structural changes in central relationships between cerebral neurons or between systems of neurons of varying complexity. The growth of a concept involves the gradual organization of many neural cell assemblies or complicated circuits. Extensive brain tissue is necessary for the initial establishment of these assemblies but with time and experience there is short circuiting and some of the assemblies originally involved are no longer necessary. Hebb postulates that for this reason brain damage may be relatively less severe in its effects on adults than on children. The theory is also compatible with such facts as the extreme slowness with which adults, recovering from congenital blindness, learn to distinguish objects like squares and circles. The cell assemblies involved have to be organized and this takes time.

Experimental evidence continued to pile up in 1949 on the problem of learning, though none as yet made possible a decisive choice of principles which hold in all learning situations. Several papers during the year, including one by E. C. Tolman, accepted the familiar notion that there may be a number of different learning principles which operate in different types of learning situations. Tolman stated, for example, that need reduction may be essential in learning what objects satisfy a need. So the reduction in hunger by eating certain foods may be the basic factor in learning what food satisfies hunger. On the other hand, he believed that Gestalt principles of organization are of prime importance in acquiring expectations or in learning how and by what means goals are reached. But, it was suggested, the learning of motor skills or motor patterns, like writing movements, may rest simply on the association of stimuli and movements which have occurred together in the past.

The most important event of the year in the field of social psychology was publication of the first three volumes of the projected four volume series, *Studies in Social Psychology in World War II,* based on the work of the research branch of the war department from 1941 to the end of the war. Most of the studies were designed to meet practical wartime demands, and the writers were fully aware of the consequent limitations of the information for the purposes of scientific generalization. Nevertheless, they extracted from interviews with more than 500,000 U.S. soldiers observations of the greatest importance for the historian, for those concerned with administrative problems and for the social scientist. The first of the volumes summarizes the problems of personal adjustment to institutionalized army life. The second deals with combat and its consequences and the third reviews experimental studies of the impact on the soldier of educational and indoctrination films. The attitudes of the educated soldier are compared with those of the uneducated, those overseas with those at home, those with good chances of promotion and those with poor chances. Adjustment is traced in relation to background characteristics such as age, marital status, education, maternal overprotection, etc. Job efficiency is examined in relation to the soldier's views about his position and his opportunities to choose his own job. A whole chapter is devoted to the problems of the Negro soldier. Fear in combat and the army's attempt to cope with this problem are analyzed. The motion picture and other techniques of giving information and changing attitudes are evaluated. The final volume, scheduled to appear in 1950, examines the fundamental concept of attitude and the contributions of the research branch to methods of attitude measurement.

Following the failure of the commercial public opinion polls to predict correctly the outcome of the 1948 presidential election, there was much interest in the reasons for this debacle involving the use of a tool which social psychology and other social sciences had begun to rely on extensively. A committee of experts was set up by the Social Science Research council to examine the available information about the polls and the election and to discover the sources of error. It was concluded that two major difficulties were involved: (1) errors of sampling and interviewing; and (2) errors of forecasting, which involved a failure to assess the future behaviour of undecided voters and to detect shifts of voting intention near the end of the campaign. The errors of sampling and interviewing could be reduced by newer methods, but reduction of error at other points depended on further basic research in psychological and political behaviour. It was noted that the public was misled regarding the accuracy of the polls by the manner in which results were analyzed and published. There was nothing in the situation to warrant disparagement of properly conducted sampling surveys.

A whole issue of the *Journal of Consulting Psychology* was devoted to the report of one of the very few systematic attempts ever made to evaluate psychotherapy. A group under the direction of Carl R. Rogers described six studies of the therapeutic process, including careful and objective analyses of attitudes towards the self, the relation of self-acceptance to acceptance of other people, the way in which insight develops, changes in the maturity of behaviour and changes in expressions of defensive behaviour. Though the number of cases was small and there was no comparison of the group receiving therapy with a similar group given no therapy, this honest attempt to record interviews, define concepts and check the amount of agreement on observations promised to be the beginning of a healthy departure from the usual unscientific evaluations of treatment. The status of psychotherapy was well summarized by Hebb: "It seems generally believed that the validity of psychoanalytic theory is well established by the fact that it has led to curing mental illnesses that would not otherwise have been cured. If one looks for the evidence, however, one cannot find it. . . . There is no body of fact to show that psychotherapy is valuable." (From D. O. Hebb's *Organization of Behavior*, John Wiley and Sons, Inc., 1949.) These first efforts of Rogers to subject his methods of nondirective therapy to scientific test constituted a landmark for clinical psychology.

The last book written by Sigmund Freud was published in English during the year, under the title *An Outline of Psychoanalysis*. In this small volume are brought together the principal doctrines of psychoanalysis as Freud saw them at the end of his career. Selected writings of E. L. Thorndike, based on papers dating from 1913 to 1946, were published in one volume during the year. (*See* also PHYSIOLOGY; PSYCHIATRY; PSYCHOSOMATIC MEDICINE.)

Psychosomatic Medicine.

Physicians, nurses and social workers occupied in tuberculosis sanitoria had frequently observed the high incidence of neurosis in patients suffering from this disease. Studies published on emotional factors in tuberculosis had generally dealt with only a few case reports, the observations of social service workers, or general comments by physicians untrained in psychiatric techniques. In 1949, however, a study by Eric Wittkower of 785 patients observed over a period of two and one-half years, provided much useful information concerning the role of emotional factors in tuberculosis. The views expressed did not clash in any way with those held by tuberculosis specialists, who had long known that an unhealthy mode of life and mental upsets often preceded the onset of symptoms of tuberculosis. But, going beyond these observations, Wittkower made an attempt to explain how this unhealthy mode of life came about, what formed the basis and what were the common features of the precipitating mental upsets.

He showed that an inordinate need for affection was an outstanding common feature of the premorbid personality of tuberculosis patients; this need might be openly expressed, thinly disguised, well concealed or flatly denied. Situations arousing aggressiveness or endangering the delicately poised security system of the patients often preceded the onset of symptoms of tuberculosis.

In brief, people developing tuberculosis seem to have a frequent inability to deal adequately with their aggressive impulses and were prone, for varying reasons and in different ways, to turn them against themselves.

W. A. Tillmann and G. E. Hobbs made a study of the psychiatric and social backgrounds of the accident-prone automobile driver. Dealing chiefly with taxi drivers, they discovered that the high-accident group showed a marked intolerance for, and aggression against, any authority, and that this behaviour dated from early childhood. The origin of the aggression was found in an unstable home background and showed up in antisocial behaviour. Analyzing 96 drivers from the general population who had had four or more accidents and comparing them with a control group of accident-free drivers, they found that 66% of the high-accident group were known to social and law enforcement agencies as compared with only 9% of the control group. Commenting upon the question of the selection of drivers by personnel managers, they stated that safe driving depended more on judgment, caution and consideration of the possible errors of others, than upon reaction time and binocular vision. They added that any intelligent personnel manager could learn to take the kind of life history necessary to detect the unstable person who is prone to get into accidents.

It became increasingly clear in 1949 that psychiatry has an important relationship to industrial medicine. G. A. Eadie described his method of handling psychosomatic problems indicating that the surface complaint is not the same as the latent complaint and that one must look into the details of the latter.

Eadie emphasized that interest in emotional factors must not lead to neglect of possible physical factors, and mentioned a number of problems such as multiple sclerosis, Parkinson's disease, hyperthyroidism and anxiety attacks that may contribute to disability and be responsible for industrial accidents.

With new discoveries regarding the role of the sex organs as producers of hormones (and the isolation and synthetic production of these hormones) biologists believed that a simple explanation of sexual behaviour and a simple treatment of abnormal sexual behaviour were at last available. But the simplicity of this explanation had already been questioned by animal experimentation which suggested that subcerebral mechanisms capable of mediating sexual responses had become more dependent upon the higher nervous system, and that the development of this increasing dependence on the cerebral cortex had to some degree freed the more primitive sexual mechanisms from strict control by gonadal hormones.

W. H. Perloff questioned this simple explanation in 1949 as far as the human being was concerned. He stated that three elements have to do with human sexuality. The first is the genetic factor which predetermines the particular type of sexual pattern and is constant within limits for any one species. The second factor is the hormonal one which leads to the development of the organs needed for the sex act and increases their sensitivity to stimulation. But the third important factor is psychological and this is concerned with the choice of the sex object and with the intensity of the sexual emotions. (*See* also Medicine; Psychiatry; Public Health Services.)

Public Health Engineering.

World shortages of water in 1949 represented a continuation of the difficult experiences of the winter of 1947–48. In many countries the high summer temperatures and rainfall deficiencies of 1949 heightened the problem. Perhaps the most significant evidence of this difficulty was the shortage in the New York metropolitan area, still persisting by the end of the year. With the largest water consumption in the world, somewhat more than 1,000,000,000 gal. a day, the New York area found itself with storage to carry over only 60 days, if the low rainfall conditions of the fall continued during the early part of 1950. Less than 35% of the potential capacity of its storage reservoirs was available by the end of the year. The spectacle of a utility serving more than 8,000,000 people attempting to conserve a dwindling supply by resorting to curtailment of accepted modern uses of water was not a happy one.

The situation was paralleled along the entire Atlantic seaboard of the United States, while in Britain municipal customers were warned of the necessity for drastic curtailment of water use. Conditions in France, Switzerland and South Africa were similarly acute. It was rare that water shortage, with its concomitant climatic and meteorological causes, should prevail over such a large part of the world.

The importance of this phenomenon could not be overestimated, since it pointed to the necessity for setting planning stakes many years ahead in the provision of water supply.

Reminders of ever-present environmental hazards also appeared during 1949 in an outbreak of typhoid fever in France, aggregating some 280 cases at St. Etienne. The exact origin of this environment-borne disease had not been determined by French authorities at the end of the year.

Further light was shed during 1949 on the possible cause of endemic and epidemic paratyphoid fever, food poisoning and acute diarrhoea of children under two years of ago. Australian investigators disclosed that babies are carriers particularly of the salmonella group of organisms. The findings might give a clue to the mysterious hospital epidemics of very young babies, under conditions of crowding and cross infection in nurseries. The infant carrier rate of salmonella infections was thought to be as important in the community as typhoid and dysentery carrier rates in older persons.

The rapid expansion of the nuclear fission industry resulted in the development of new radioactive materials and wastes. There was rapid progress in the understanding and detection of liquid, solid and gaseous wastes from the atomic energy industry in Great Britain and the United States, and the methods for reducing these wastes. Much research was in progress to develop and improve methods and instruments for detecting radiation in air and in water.

The addition of fluorides to public water supplies for the prevention of dental caries in children was still arousing a great deal of lay and official interest. By the end of 1949 about 17 fluoridation installations were in operation in nine states in the United States. Fourteen additional ones had been approved, and 20 more were under consideration.

CITY INSPECTORS grading smoke density in Pittsburgh, Pa., in 1949, by matching it with shades ranging from light gray to black on a Ringlemann chart (left). Violators of smoke-abatement rules were subject to fine

Further research on the effect of the addition of fluorides to water was planned in view of the fact that in New Mexico objectionable fluorosis or mottled enamel of the teeth had resulted from the presence of as little as 0.7 p.p.m. in the water supply. One part per million had been normally considered to be protective of the teeth. The fluoridation of one water supply, at Charlotte, N.C., appeared to result in a serious increase of cracking in ice manufactured from the treated water.

Home accidents received more attention from official preventive health agencies. Accident proneness was being recognized as an attribute of the disturbed personality and of the impaired physiology of the individuals. The correction of unsafe conditions of environment, however, was an essential ingredient of successful accident prevention. In 1949 almost 100,000 persons were killed in all types of accidents, and more than 10,000,000 received disabling injuries. Accidents ranked fourth as a cause of death in the United States and home accidents first in the accident category.

The eradication of insect-borne diseases by use of DDT and other engineering techniques moved forward in Latin America, Egypt, Sardinia, Italy, India and other places. Even if susceptibility of mosquitoes and flies to DDT gradually declined, there was hope that newer synthetic chemicals would provide continuing opportunities for eradication and control.

The relation of nitrate nitrogen concentrations in well waters to the occurrence of methemoglobinaemia in infants was being increasingly demonstrated and studied in the United States. A detailed review was issued by the Minnesota state department of health, and other states were watching this new water-borne disease with increasing interest. Further study of the significance of high nitrate nitrogen content of water was obviously required. It was equally apparent that health authorities should view with suspicion waters from private household well supplies having nitrate nitrogen contents in excess of 10 p.p.m., where such water was to be used for infant feeding.

Baltimore, Md., became the first U.S. city in which the courts held the federal government responsible for permitting insanitary conditions to exist in a public housing project which resulted in a number of cases of typhus fever and several deaths of murine origin. On the basis of this principle of responsibility by a landlord for environmental conditions, damage suits were instituted by the survivors of those who died.

The Donora, Pa., experience with heavy atmospheric pollution in 1948 led to extensive studies of this problem in various parts of the United States and Great Britain. The report released by the U.S. public health service in 1949 on the Donora experience was perhaps one of the most comprehensive reviews on record of such a catastrophe. Research in the Los Angeles, Calif., area on the unusual conditions of smog which had existed at frequent intervals over this territory for the preceding eight or nine years provided additional basic information on an environmental problem of increasing importance in industrial areas.

The Expert Committee on Environmental Sanitation of the World Health organization, which met in Geneva, Switz., in Sept. 1949, released its report on "Environmental Sanitation in the World Today." It proposed a detailed program of eliminating, on a progressively increasing basis, those diseases upon which environmental sanitation might make its greatest impact.

The report of a comprehensive survey of Iran, by a group of engineers and medical experts, represented one of the rare diagnoses of an entire country. The high priority accorded the development of water supplies and other environmental features of public health was another distinguishing feature of the report. (*See* also Child Welfare; Epidemics; Industrial Health; Public Health Services.) (Ab. W.)

Public Health Services.

The control of chronic diseases of later life was becoming an ever-increasing public health problem in 1949. Authorities agreed that programs for the control of such illnesses should include:

1. Widespread early case-finding services, especially examinations for early and precancerous lesions, diabetes, high blood pressure, heart disease, kidney disease and arthritis.
2. Facilities for chronic disease care, with major emphasis on home and hospital care, associated with medical centres and medical schools.
3. Provision for the rehabilitation of chronically ill patients.

Diseases of the Heart and Circulatory System.—Diseases of the heart and blood vessels continued to be the most important health problem. Congenital heart disease, however, was a relatively small factor of the total problem, and syphilitic heart disease, with modern antibiotic treatment of syphilis, was decreasing measurably.

The relation of streptococci to rheumatic fever was not yet established, although authorities believed such a relationship probably existed. Epidemiological control of streptococcal infections was a promising avenue of approach, and the use of sulfa drugs after an initial attack of rheumatic fever, the use of penicillin before and after extraction of teeth and operations about the nose and throat, and the treatment of bacterial endocarditis by penicillin yielded encouraging results.

Nutritionists and biochemists produced evidence during 1949 suggesting that obesity and a high blood content of cholesterol are associated with coronary disease, and that a saltless diet may be of material value in checking the development of hypertension. Treatment of victims of coronary heart disease with dicumarol yielded encouraging results and several serious malformations of the heart in children could be corrected by surgery. (*See* also Heart and Heart Diseases.)

Diabetes.—Diabetes control had become a community, as well as an individual, health problem. Current knowledge indicated that there was hereditary susceptibility in diabetes, that a high incidence of obesity was usually found as a forerunner of the disease, and that acute infections, or exacerbation of chronic infections activated the disease. Early detection, prompt referral to a physician for competent treatment and thorough education of the diabetic patient and his family constituted important components of diabetes control in the individual and the community. (*See* also DIABETES.)

Rh Factor.—Stillbirths and certain types of fatal anaemia in newborn infants may be due to the sensitization of a pregnant woman to the blood cells of her unborn child. This condition is due to the absence in about 15% of the population of a substance known as Rh factor. Women who do not have the Rh factor in their blood may develop certain substances in their blood during their first pregnancy which, on subsequent pregnancies, may damage the infant's blood, resulting in a certain number of cases of anaemia or even death of the infant.

To help discover this 15%, many physicians in 1949 were making routine tests of the blood of pregnant women for the presence or absence of the Rh factor. Some health departments were providing such laboratory service to the public in order to meet the problem.

Poliomyelitis.—In a carefully controlled and detailed survey of cases of poliomyelitis occurring in Chicago, A. E. Casey, W. I. Fishbein, F. N. Schabel, Jr., and H. T. Smith showed that poliomyelitis was highly contagious and extremely common in that city.

By means of virus studies on throats and stools, as well as by a determination of neutralizing antibody response in a series of contacts to cases of poliomyelitis, and immediate vicinity noncontacts and remote control groups, these investigators were able to calculate that in an average year there were from 100,000 to 125,000 cases of poliomyelitis in Chicago, or 3% to 4% of the total population. They also calculated that most children in Chicago had probably had poliomyelitis once by the fourth birthday, and 75% perhaps twice by the sixth birthday, either from different strains of virus or reinfection of a similar type of virus.

This study appeared to offer additional evidence that poliomyelitis is a very common contagious disease, and that it is only the exceptional case that attains sufficient severity to permit clinical diagnosis. (*See* also INFANTILE PARALYSIS.)

Tuberculosis.—During 1949 it was reported that the proportion of deaths from tuberculosis (*q.v.*) among people over 45 years of age was steadily increasing. An important factor in this shift from younger to older age groups was that tuberculosis rates had declined more slowly in the latter group. The increasing age of the population as a whole also accentuated the degree of change.

Public health authorities agreed that older people were a major source of infection in the population. Special efforts were needed to discover the disease for the protection both of individuals and of the community. (*See* also EPIDEMICS; FEDERAL SECURITY AGENCY; INDUSTRIAL HEALTH; MEDICINE; NUTRITION, EXPERIMENTAL; VENEREAL DISEASES.)

(H. BU.)

British Commonwealth.—1949 was the first full year during which the National Health Service act of 1946 operated. Of the population 95% had registered with general medical practitioners under the scheme. Although a large proportion of doctors in general practice accepted service under the scheme, patients were sometimes delayed in obtaining treatment owing to the shortage of doctors; and there were complaints of overwork in the profession. There was evidence that some people were going to their doctors too readily and that the provision of free medicine was being abused by a minority of the patients. It was decided, therefore, that a charge of one shilling should be made for each prescription. There was some criticism of the service being available to foreigners. It was therefore decided that the provision of artificial limbs, dentures and other appliances or expensive treatment should not be available to persons coming specially to Great Britain for the purpose. Dental treatment was even more difficult to obtain than medical treatment because for some years there had been a great shortage of dentists in Great Britain. Under the new scheme the earnings of some dentists were considered to be excessive and revision of their fees was under consideration. In the school medical service dentists continued to be paid by salary and there was a tendency for this service to suffer since private practice became more attractive. The ophthalmic service was also carried on under some difficulty, particularly in the supply of spectacles, of which 5,000,000 were provided in the first year.

When the new scheme was introduced the British Medical association, acting for the profession, feared the possibility of the establishment of a state medical service. The National Health Service (Amendment) act, 1949, was accordingly passed to give a statutory guarantee that a full-time salaried service for general medical practitioners would not be introduced without special legislation. This act also met objections which had been raised to the operation of the main act in regard to partnership agreements.

The development of the health services received consideration in the dominions and particularly in Canada where during the year progress was made with the National Health program under which about $30,000,000 was to be made available by the dominion government to the provinces for the improvement of health services.

In India consideration was given to the indigenous systems of medicine, known as *Ayurveda, Unani,* etc., and a scheme in connection with the Employees Insurance act.

In Britain, because of financial stringency, it was possible to make only a small increase in hospital provision. There was considerable difficulty in obtaining hospital accommodation for the elderly sick. On the other hand, in some hospitals the accommodation for the sick was being used by ambulatory patients. Voluntary organizations (particularly the National Corporation for the Care of Old People and the National Old People's Welfare committee) in association with the medical profession were exploring the possibility of establishing rest homes to which such persons could be transferred. Similar problems were receiving attention in the United States and Canada. Economy of expenditure and restrictions on new building limited progress in the provision of health centres by local health authorities.

The estimated cost of the service for the financial year was £232,000,000 or about 2*s.* 1*d.* a person a week of the whole population.

Public Utilities.

From the point of view of legislation in the field of public utilities, the year 1949 was singularly unproductive. The only legislation potentially important was an amendment to the Rural Electrification act of 1936 which provided for the improvement and development of rural telephone service. The general aim of the program was to loan funds and give technical assistance to rural telephone utilities.

The administrator of the Rural Electrification administration was directed to authorize and make loans to utilities which provided, or which in the future might provide, telephone service in rural areas. Preference was to be given to existing agencies which provided service and to co-operatives or to nonprofit, limited dividend and mutual associations. The highest priority was extended to existing suppliers for the first year. Specifically, the purpose of the financing was the improvement, expansion, construction, acquisition and operation of telephone lines, facilities or systems. The loans must be repaid over a period of 35 years and were to bear interest at 2%. The amount of each loan was limited to 50% of the total capitalization of the borrower. To assure financial liquidity the REA must pass upon the physical condition of the property which was to be security for the loan together with the past revenues and prospective revenues available for interest payment and the annual amortization quota. Minor points to be considered were the extent to which REA guidance and help in managerial practices would promote efficiency, and the degree to which the community was interested in the project. This would make possible better forecasting of the quantity of subscriber use as well as of continuity of demand.

Chief among the legislative proposals during the year were those emanating from the Commission on Organization of the Executive Branch of the Government (Hoover commission). Although there were dissenting voices, the majority proposed that the department of the interior be divided into four major divisions: (1) water development and use; (2) building construction; (3) mineral resources; (4) recreation service. The first of these would be of primary interest to public utilities. Although it was rumoured that Herbert C. Hoover favoured converting the department into a department of natural resources, the changes suggested were to remain within the existing framework. Within the first division would be grouped the bureau of reclamation, the Bonneville Power administration, the Southwestern Power administration, the division of power—all these already functioning within the department—and the civil functions touching rivers and harbours improvement, which would be transferred with available personnel from the army corps of engineers. The purpose of the reorganization would be to eliminate conflicts and overlaps which were said to cost the taxpayers large sums annually. Contradictory and complex federal reclamation laws were likewise found to be in need of revision. With respect to independent regulatory commissions the Hoover report recommended integrating the Securities and Exchange commission with the Federal Power commission after the former's activities relating to holding company simplification and integration had been accomplished. It also recommended the transfer of the nonregulatory functions relating to river basin and power market surveys of the Federal Power commission to the department of the interior.

Mounting criticism was directed against the tendency of the federal government to regulate purely local affairs. A case pending in the United States supreme court concerned the jurisdiction which the Federal Power commission was asserting over the rates and service of the East Ohio Gas company. This company had been subject to regulation by the Ohio commission since 1911. It did not conduct an interstate business but sold gas directly to consumers in 69 different Ohio cities. But it had 112 mi. of pipe line extending to a point near the Ohio border where it received natural gas from an interstate transmission line company. The outcome of this litigation was being watched with extreme interest by the national association of state utility commissioners who feared further inroads by federal agencies into state regulation of this and other types of utilities.

The Wisconsin commission, which with the California commission was still permitting utilities to make a reservation for depreciation on a sinking fund basis, disapproved a 3½% sinking fund method as hitherto authorized for the Wisconsin Electric Power company. Henceforth, these reservations were to be made set up on a straight-line basis with a deduction for the accrued depreciation for rate-base purposes.

A significant happening in 1949 was the congressional appropriation of $2,500,000 to the Tennessee Valley authority to begin construction on a $37,000,000 steam plant at New Johnsonville, Tenn. This step was strenuously resisted by the organized private utility industry which had been successful in defeating a similar proposal in 1948. The management of TVA insisted that this expansion in steam capacity was necessary to firm up hydroelectric power and to supply much needed reserve capacity.

The Great Lakes-St. Lawrence seaway and power project once more received the endorsement of Pres. Harry S. Truman. The New York power authority, on the other hand, proposed that New York and the Canadian province of Ontario undertake the power project jointly. The formidable opposition to this joint navigation and power project appeared to be crumbling, with the Great Lakes shipping interests and the steel companies of the United States showing an interest in the seaway. The reason for the shift was the rapid depletion of the iron ore deposits in the Mesabi range and increased interest in the newly found deposits in Labrador. To make this ore supply available at cheap water transportation rates would require both the construction of a railway to tidewater and the improvement of the seaway in its lower reaches where the chief bottlenecks were located. (*See* also DAMS; ELECTRICAL INDUSTRIES; FEDERAL POWER COMMISSION; RAILROADS; RURAL ELECTRIFICATION; TELEGRAPHY; TELEPHONE; TENNESSEE VALLEY AUTHORITY.) (M. G. G.)

Canada.—The discoveries of great natural-gas pockets in Alberta brought gas utilities into prominence. Plans were discussed to overcome the political and economic difficulties in the way of piping Alberta gas to Pacific-coast Canadian and U.S. cities and into the Peace river area. New wells discovered in southwestern Ontario were helpful but did not prove large enough to offset the natural decline in old wells. A rise in the use of propane gas in various parts of Ontario and Quebec effectively supplemented such natural-gas shortages.

Some provincial developments of interest included: the Prince Edward Island public utilities commission undertook an inquiry into electric rates; Newfoundland took steps to create a commission to control all public utilities; Quebec announced a public services board to rule on questions concerning maritime transportation, waterworks, sewage systems; a Quebec court ruled that a private car owner who took fellow-workers to work did not infringe a bus company's franchise even though the workers contributed money to buy his gas; the Alberta public utilities board cut Edmonton milk deliveries to six per week, which was followed suit by Toronto, Ont. (C. Cy.)

Great Britain.—After its first year of operation, beginning on April 1, 1948, the British Electricity authority had completed its organization. The total installed generating capacity (at the end of September) of the B.E.A. and the North of Scotland Hydro-Electric board together was 13,564 megawatts, and the peak load carried during the winter 1948–49 was 10,163 megawatts. During the first year of operation (April 1948 to March 1949) the number of units sent out was 44,784,000,000, an increase of 10.5% on the total for the preceding year. The number of consumers was estimated to be 12,300,000. Plans for new generating capacity to be installed by the B.E.A., up to and including 1952, covered a total of 5,518 megawatts. Hydroelectric development in north Wales, including six major schemes to cost approximately £20,000,000 and with an estimated annual production of about 500,000,000 units, were approved in principle.

The annual report of the Electricity board for Northern Ireland showed that in 1948 the number of units sold rose to 179,830,000, an increase of 28% over the preceding year, and the number of consumers to 83,066, an increase of 6,690.

(E. W. G.)

The transfer of the gas industry from company and municipal enterprise to state ownership was effected smoothly on May 1, 1949, when under the Gas act, 1948, the property of 1,056 undertakings was entrusted to 12 largely autonomous area gas boards, which became responsible for the manufacture and distribution of gas, coke and products in England, Scotland and Wales.

The area boards in general found plants to be reasonably up-to-date and adequate, the works well managed, the distributing systems sufficient and the service to consumers good.

The price of gas in many localities was increased subsequent to nationalization, in order to relate prices to the costs of production. In Nov. 1949, compared with Nov. 1948, the average weekly production of gas increased by 600,000,000 cu.ft., and the average weekly consumption of coal at gasworks increased by 17,000 tons.

Compensation on nationalization was paid to the majority of gas shareholders during the year by the issue of 3% British gas stock, 1990–95. The value of most shares was determined by the stock exchange prices on the dates stated in the Gas act, or by agreement between the stockholders' representative of each undertaking and the ministry of fuel and power.

(J. R. W. A.)

The summer of 1949 in Great Britain was the driest after 1921 and the sunniest after 1933, and consequently numerous water undertakings experienced difficulty in maintaining a continuous supply of water to their consumers, and many found it necessary to introduce restrictions of the use of water. Citizens were compelled to use sea water for dishwashing and sanitation, and some even experimented with it for cooking purposes.

Not only in Great Britain but in Europe and in other parts of the world severe drought conditions were experienced. In Africa the effects were serious from the Cape of Good Hope to Kenya, and many government feeding schemes were introduced to avert famine.

The ministry of health continued to publish reports dealing with the water resources of various parts of the country to provide a basis of discussion which might lead to the improvement of water supply in those areas.

The first general assembly and congress of the International Water Supply association, set up in 1947 by delegates from Great Britain, France and the Netherlands, was held in Amsterdam, Netherlands, in September and was attended by delegates from about 20 countries. (J. Kd.)

Europe.—Under the European Recovery program an international program of power station construction and interconnection had been planned for western European countries. This covered the building of a total capacity of 2,800 megawatts to produce 7,700,000,000 units annually, including 13 hydroelectric projects in Austria, France, Italy, Switzerland and the Benelux countries. A complementary program included national projects requiring external financial assistance. The total planned capacity under the two programs was 7,800 megawatts, which was in addition to the national projects for 15,000 megawatts. The largest increases in net generating capacity during the next five years were to be: Great Britain (6,600 megawatts); France (2,690 megawatts); Italy (2,971 megawatts); and the bizone of western Germany (3,000 megawatts). The greatest percentage increase was for Greece, where the capacity was to rise from 156 megawatts in 1948 to 619 megawatts in 1953.

The position of power capacity and energy production in western Europe was clearly set out in a report of the electricity committee of the Organization for European Economic Cooperation issued during the year. This showed that an estimated deficit of 8,500,000 kw. in 1949 would be likely to rise, through increasing demand, to a deficit of 20,000,000 kw. by June 1952 and that the new construction planned would still leave a gap of 4,000,000 to 5,000,000 kw. or 16,000,000,000 kw.hr. a year.

The potential water power resources capable of development in the Scandinavian countries was estimated, in terms of annual energy production, as follows: Norway 120,000,000,000 units a year; Sweden 50,000,000,000; Finland 10,000,000,000.

Publishing (Book): *see* Book Publishing.

Puerto Rico. A U.S. insular dependency in the West Indies, Puerto Rico has an area of 3,435 sq.mi. Pop. (July 1, 1949, est.) 2,180,314, (1940 census) 1,869,255. According to 1949 population estimates, rural population was 64% of the total, urban population, 36%. Chief cities (with 1949 urban pop. est.): San Juan, the capital (237,623); Ponce (74,393); Mayagüez (62,051); Arecibo (38,788); Caguas (28,173); Río Piedras (26,523). Languages: Spanish and English. Religion: predominantly Roman Catholic. Governor in 1949: Luis Muñoz

SKILLED LABOUR for Puerto Rico's growing industrialization being trained to operate machine tools in the School of Industrial Arts opened at San Juan, in 1949, as part of the University of Puerto Rico

Marín.

History.—With the election of the governor by the people of Puerto Rico in Nov. 1948 and his taking office in Jan. 1949, Puerto Rico became for all practical purposes a self-governing part of the United States. The elected governor appoints all members of his cabinet, which comprises the attorney general, the treasurer and the commissioners of the departments of agriculture and commerce, health, education, labour and interior. The legislature of Puerto Rico, composed of a senate and a house of representatives, and elected for a term of four years by the people of Puerto Rico, is empowered to legislate in all matters pertaining to the internal affairs of the island.

Education.—There were 446,520 pupils enrolled during 1949 in the public and private schools. Public schools, 421,625 pupils; private schools, 24,895. Enrolment in the public schools was distributed as follows: 300,163 in elementary schools, 86,066 in secondary day schools, 1,292 in vocational schools, 12,625 in evening schools and 21,479 in special groups for veterans. In the public schools, the number of teachers, principals, assistant principals and assistant superintendents was 9,375. Private schools employed 1,070 teachers. Higher education was carried on by three institutions: The University of Puerto Rico, the Polytechnic Institute of Puerto Rico and the College of the Sacred Heart. During the year another university, Santa María university, was opened by the Catholic Church at Ponce.

Banking and Finance.—At the close of the fiscal year 1948–49, 13 banks with 31 branches were operating in Puerto Rico. Bank deposits on June 30, 1949, were $244,399,042; debits were $275,148,472 and bank loans were $119,412,788.

Insular government revenues and receipts for the fiscal year 1948–49 totalled $206,818,177, of which $108,906,216 was received in the general fund, and $97,911,961 in all other funds. The total disbursements for the same period were $230,113,948. Of this total, disbursements from the general fund amounted to $132,462,349 and from all other funds $97,651,599.

Trade.—The total value of imports into Puerto Rico during the calendar year 1948 was $362,373,214. Of this total, $337,929,793 (93.3%) were shipments from the United States to Puerto Rico and $24,443,421 (6.7%) were imported from other countries. The total value of exports for the same period was $194,952,278, of which $188,627,317 (96.8%) were shipments from Puerto Rico to the United States and $6,324,961 (3.2%) were exported to foreign countries.

Communications.—During the fiscal year 1948–49, 55,710 motor vehicles were registered, of which 34,570 were automobiles and buses, excluding government-owned automobiles; 9,098 were heavy trucks; 8,212 were light trucks; 3,830 were other motor vehicles. The insular department of the interior kept under maintenance as of June 30, 1949, 3,437 km. of roads.

During the fiscal year 1948–49, 3,130 vessels arrived at the island, with a registered tonnage of 9,916,700 short tons. During the same period, a total of 124,275 passengers came to the island; 116,620 by air and 7,655 by water. A total of 157,328 passengers went out of the island; 150,040 by air and 7,288 by water.

At the close of the fiscal year 1949 (June 30, 1949) there were 33,312 telephones in service.

Agriculture.—During the 1949 crop year, 10,998,200 short tons of sugar cane were harvested. The tobacco crop for 1949 was estimated at 270,000 cwt. The coffee crop for 1949 was estimated at 229,200 cwt. Pineapple production for the same period was estimated at 1,250,000 crates.

Manufacturing.—Sugar production for the 1949 crop year amounted to 1,278,000 short tons of raw sugar, 96° basis. Sugar-refining operations in the island yielded 210,000 short tons of refined sugar, 96° basis.

The total production during the fiscal year 1948–49 of some other manufactured products was as follows:

Product	Production	Product	Production
Molasses, gal.	54,947,737	Shoes, pairs	273,243
Distilled spirits, proof gal.	1,813,879	Heavy clay, tons	11,613
Cement, bbl.	2,466,703	Sanitary ware, pieces	29,468
Cigars	66,497,000	Glass containers, short tons.	18,403

During the fiscal year 1948–49 the total amount of constructions authorized through building permits amounted to $43,037,302. Electric power generated for the same period amounted to 494,440,325 kw.hr.

Employment.—As of June 30, 1949, the total labour force of Puerto Rico was estimated at 701,000 persons. Of this total, 644,000 were employed, 250,000 in agriculture and 393,000 in all other industries. The estimated unemployment as of this date was 57,000 persons.

(J. L-Ee.)

Pulitzer Prizes.

The annual Pulitzer prizes in journalism, letters and music, first awarded in 1917, were established at Columbia university by the will of Joseph Pulitzer. The 1949 prizes in letters, five in number and of $500 each, were awarded as follows: fiction award to James Gould Cozzens for *Guard of Honor* (Harcourt, Brace); history award to Roy Franklin Nichols for *The Disruption of American Democracy* (Macmillan); biography award to Robert E. Sherwood for *Roosevelt and Hopkins* (Harper); poetry award to Peter Viereck for *Terror and Decorum* (Scribner); drama award to Arthur Miller for *Death of a Salesman* (Viking).

Eight prizes in journalism amounting to $500 each were awarded as follows: for meritorious public service to the *Nebraska State Journal* for its campaign for an "all-out" presidential preference primary in Nebraska; for local reporting to Malcolm Johnson of the *New York Sun* for his series of 24 articles, "Crime on the Waterfront"; for national reporting to C. P. Trussell, Washington correspondent of the *New York Times*, for his "consistent excellence in covering the national scene from Washington"; for international reporting to Price Day of the *Baltimore Sun* for his series of 12 articles entitled "Experiment in Freedom—India and Its First Year of Independence"; for distinguished editorial writing to John H. Crider of the *Boston Herald* and Herbert Elliston of the *Washington Post;* to Lute Pease of the *Newark Evening News* for his cartoon "Who, Me?"; to Nathaniel Fein of the *New York Herald Tribune* for his outstanding news photograph "Babe Ruth Bows Out."

The Pulitzer prize in music, first given in 1943, was awarded to Virgil Thomson for his music for the motion picture *Louisiana Story.*

Quebec.

The largest Canadian province, with an area of 594,534 sq.mi., Quebec is located centrally along the lower St. Lawrence river, and extends north to Hudson bay strait. Pop. (1941) 3,331,882; (1949 est.) 3,887,000. The chief city is Montreal (*q.v.*) (pop. 1941) 903,007, and capital is Quebec city (pop. 1941) 150,757.

History.—During 1949 the Quebec provincial government called for a clearer delineation of federal, provincial and municipal tax fields, and set up a commission to look into federal "intrusion" into the provincial insurance field.

The legislature studied 130 bills during the 1949 session, the most significant being: increased aid to agriculture; extension of highways; reclamation of marshlands through drainage, and authorization of $3,500,000 as a contribution to interest charges on private housing loans. Despite a popular poll which recorded that 55% of the province's voters were in favour of the sale of margarine, the government banned the manufacture and sale but not possession of the butter substitute. A new court of review in provincial matters was created to provide for the right of appeal against judgments in penal prosecutions.

A bill to enact a labour code was introduced into the legislature on Jan. 19, 1949, and shelved indefinitely on Feb. 9, in the face of strong labour union disapproval. The proposed code not only consolidated existing legislation but proposed banning Communists from union posts, compulsory audit of union books and restrictions on union security and striking. Labour legislation which passed provided for arbitration of disputes between municipal and school corporations and their employees. By amendments to the Social Welfare and Youth act, the government was empowered to organize handicraft, arts and crafts, and trade schools, in an effort to increase technical ability and raise labour standards.

Education.—Government spending on education was raised from $14,331,000 for 1948–49 to $18,538,400 for 1949–50, with a considerable part of the latter being capital expenditures. The latest revised statistics available in 1949 were for 1946 provincially controlled schools: total enrolment, 557,972; average daily attendance, 472,602; total revenue

(1945) $32,338,257.

Health and Welfare.—The public health was strengthened in 1949 to protect workers exposed to harmful dusts, gases and fumes. The department of health reported that the general mortality rate had been reduced to 9.1 per 1,000, but the infant mortality rate stood at 57 per 1,000 (compared with 132 per 1,000 in 1935). The number of hospital beds increased to 54,600 by Jan. 1949 (1936: 36,000). During 1948, 125,000 persons were given free tuberculosis examination, and the number of provincial mobile inspection units was increased to five during 1949. The province received its share of the annual federal $30,000,000 health grant.

Communications.—The 2,344,125 tourists visiting Quebec in 1949 spent $125,000,000 in the retail trade, which was running at the monthly rate of $154,000,000 in Sept. 1949 (Sept. 1948: $141,000,000). However, the provincial government road program was reduced from $63,605,000 in 1948–49 and to $36,775,000 in 1949–50. Railway projects included the Romain River Railway to tap the newly discovered titanium deposits and the Quebec North Shore and Labrador Railway to tap the iron ore deposits.

Finance.—The report of public accounts for the fiscal year ending March 31, 1948, tabled in the legislature in Jan. 1949, showed revenues at a record level of $167,792,991, expenditures of $164,352,233, net public debt of $274,912,456. Presenting the 1949–50 budget in Feb. 1949, the government estimated $176,650,000 in revenues and $176,497,860 in expenditures (all-time high). The biggest payments were slated for agriculture ($12,226,000), social welfare and youth ($17,603,000), colonization ($7,591,900), health ($26,068,250) and roads ($36,775,000).

Natural Resources.—The biggest development during 1949 was the discovery of vast additional iron ore fields in northeastern Quebec adjacent to the Quebec-Labrador fields discovered in 1947. It was estimated that it would cost $1,400,000,000 to develop the region, and immediate expenditures of $200,000,000 were announced, to produce 10,000,000 tons annually by 1953. Rich gold veins were uncovered at Chibougamau, and a $4,000,000 road was pushed to open the area. Uranium was discovered at Portneuf and samples were under commercial investigation at the year end. By 1949 the provincial government, as part of its program to aid commercial fisheries, operated 40 cold storage plants, 3 artificial dryers, and 41 grading sheds.

FILMS OF 1949.—*Saguenay* (National Film Board of Canada).

(C. Cy.)

Quirino, Elpidio (1890–   ), president of the Republic of the Philippines, was born on Nov. 16 in Vigan, Luzon, and graduated from the University of the Philippines law school in 1915. He became secretary to Manuel Quezon, who was later first president of the Philippine commonwealth. Quirino served in the Philippine house of representatives and also in the senate, and in 1936 was named secretary of the interior. During the Japanese occupation he practised law and secretly helped the guerrilla movement. He became vice-president of the new Republic of the Philippines in 1946, and president on the death of Manuel Roxas, April 15, 1948. In July 1949, Quirino conferred with Chiang Kai-shek, retired president of nationalist China, who proposed an anti-Communist union of Pacific nations. In August, Quirino addressed the United States congress on the subject of the union. He received sympathetic interest from the U.S. state department but no assurance of active U.S. backing. In Nov. 1949, he was re-elected president in balloting that was marked by considerable violence.

Radio. Throughout the world, an estimated 6,500 radio broadcasting stations were in operation or under construction in 1949, compared with about 6,000 the preceding year. These included boosters or relay stations, but not television and frequency modulation (FM) stations.

The number of radio receiving sets in use throughout the world was estimated to have increased by 10,000,000 to 15,000,000 during the year, probably reaching 156,000,000 to 161,000,000. North America remained the leading continent in this regard, with the U.S. alone accounting for 81,000,000 (an increase of 7,000,000 over 1948), according to figures compiled by O. H. Caldwell, editor of *Tele-Tech* magazine.

U.S. Stations and Scientific Developments.—Compared with some of the earlier years, 1949 was not a time of great construction in the field of radio broadcasting. The amplitude modulation (AM) or standard broadcast band had been virtually filled in the boom years following World War II, particularly 1946 and 1947, when new stations came into being at the rate of about 500 a year. Thus, by 1949 little room was left for additional stations in this section (550–1,600 kc.) of the radio spectrum. In FM the year saw more authorizations deleted than added.

Broadcasting Magazine's box score of station authorizations showed, as of Dec. 30, 1949, a total of 3,138 broadcasting stations operating or authorized in the U.S. This was less than the figure 12 months earlier (3,219), but the number of stations actually on the air was the greatest in history—2,926, compared with 2,655 in Dec. 1948.

Most of the outstanding authorizations covered AM stations; the AM total was 2,237, a gain of 109 during the year. The number of FM permits dropped by 178, from 968 in January to 790 in December. Even so, FM closed the year with more stations actually in operation than when it started—743 as against 697 in January.

The number of new-station applicants, meanwhile, was declining. Applications for new AM outlets stood at 329 in mid-December, as against 524 a year before. Of the 329, Federal Communications commission records showed 266 were "hearing" cases, which meant in most instances that two or more applicants were seeking a frequency which for engineering reasons could be assigned to only one.

Indicative of an increasingly competitive economy, the number of station deletions—authorizations cancelled, voluntarily or otherwise—reached a record peak in 1949. The total as computed by *Broadcasting Magazine* from day-by-day reports was 282—60 AM, 209 FM, and 13 TV. These included 51 operating stations (31 FM, 20 AM). Although the economic factor did

RECORD PLAYERS matching the three types of records available in 1949: upper left, for standard records played at 78 r.p.m.; lower left, wide-spindled player for midget-sized records played at 45 r.p.m.; right, for long-playing records played at 33⅓ r.p.m. Few types of players sold during the year could be used for all three kinds of records without special attachments ot figure in all deletions, it was present in most. So also did t figure in many of the 164 major sales of full or partial inter-ests in radio stations (mostly AM) during the year. The total ale prices in the 164 transactions were reported as $13,730,500.

Facsimile.—Approximately a dozen FM stations, most of hem operated by newspapers, were engaged in facsimile transmissions during 1949. Most of the transmissions were in news-aper style. Under the technical standards, paper size was 8.2 n., with speeds permitting transmission of 16 letter-size pages er hour. In late 1949 the FCC held hearings on a petition ask-ng for removal of restrictions on the number of hours in which ultiplex facsimile was permitted. Multiplexing is the transmis-ion of both FM sound programs and facsimile simultaneously, s distinguished from simplex operations, which require inter-uption of the FM sound program during facsimile trans-issions.

U.S. Commercial Broadcasting.—*AM Revenues and Ex-enses.*—Total broadcast revenues from AM operations reached n all-time peak in the United States during 1948, the latest year or which official FCC reports were available. Despite an 11.9% ain in revenues, however, net income fell 10.73% below the 947 level, because of a 17.5% rise in operating costs.

The FCC report, issued in Dec. 1949, showed AM broadcast evenues of $406,995,414; broadcast expenses of $342,903,730; nd broadcast income of $64,091,684 before federal income axes. The figures were based on reports from 7 AM networks, heir 27 owned and operated stations and 1,797 other AM sta-ions, compared with 7 networks and 1,464 stations in 1947.

The four nation-wide and three regional networks and their 7 owned stations accounted for $109,031,802 (26.79%) of 1948 otal AM broadcast revenues and $18,085,191 (28.22%) of net roadcast income. The 1,797 other AM stations which filed re-orts accounted for $297,963,612 (73.21%) of broadcast reve-ues and $46,006,493 (71.78%) of net income. In 1947 the etworks and their 27 stations reported $104,407,721 (28.71%) f all broadcast revenues and $19,573,573 (27.26%) of broad-ast income; the 1,437 other reporting stations accounted for 259,306,666 (71.29%) of revenues and $52,222,367 (72.74%) f broadcast income.

Receipts from the Sale of Time.—Time sales, the financial ackbone of broadcasting, totalled $416,720,279 during 1948, hus setting a new record 11.4% above the previous peak figure f $374,086,686, recorded in 1947. Revenues from time sales to ocal advertisers aggregated $170,908,165, a gain of 15.65% over he preceding year's total; sales of nonnetwork time to national nd regional (spot) advertisers totalled $104,759,761 for a 4.39% gain, and sales of network time amounted to $141,052,-53, an increase of 4.7%.

These totals included commissions paid to agencies, represen-atives, etc., which broadcasters continued to count as an ex-ense of sale. Commissions totalled $50,292,281 in 1948, $47,-69,521 in 1947. (*See* also ADVERTISING.)

AM Industry Balance Sheet.—Table I, prepared by the FCC, shows comparative calendar year 1947–48 financial data for the AM broadcasting industry as a whole.

Table I.—*Financial Status of AM Broadcasting Industry in U.S.*

AM networks and stations	1948†	1947*	Per cent increase (decrease in parentheses)
vestment in tangible broadcast property:			
Cost to respondent	$201,408,564	$150,373,623	33.94
Depreciation to date under present owner	66,745,050	57,065,893	16.96
Depreciated cost	134,663,514	93,307,730	44.32
evenues, sale of network time	141,052,353	134,726,631	4.70
evenues, nonnetwork time	275,667,926	239,360,055	15.17
ommissions to agencies, etc.	50,292,281	47,969,521	4.84
evenues from talent sales, etc.	40,567,416	37,597,222	7.90
otal broadcast revenues	406,995,414	363,714,387	11.90
otal broadcast expenses	342,903,730	291,918,447	17.47
roadcast income (before federal income taxes)	64,091,684	71,795,940	(10.73)

*Seven networks, 1,464 stations covered in report.
†Seven networks, 1,824 stations covered in report.

BRIDE AND MASTER OF CEREMONIES on a "Bride and Groom" program in which couples were married at a radio studio chapel and then given household appliances such as washing machines. "Giveaway" programs were classed as lotteries by the FCC in Aug. 1949, and ruled illegal, though a stay on the ban was granted pending federal court ruling

Average Station's Finances.—The average AM station's income before federal income taxes in 1948 was $38,465, or approximately 5.9% less than it was in 1947. The figures, released by FCC, were based on reports from 1,313 stations which had been in operation for at least two years. The average pretaxes income for the year ranged from $341,257 (average of 46 clear-channel 50-kw. stations) to $4,464 (average for 66 local part-time stations).

Broadcast Expenses.—Programming remained the most expensive item on broadcasting's operating cost sheet in 1948. Of the $342,903,730 in expenses reported by 7 networks and 1,824 AM stations, $133,169,614 was classified as program expense. Next largest item was general and administrative expense, $107,937,676. Technical costs were $52,155,834; selling expenses, $47,402,165. By comparison with 1948's $342,000,000 expenses, 1947's totalled $291,918,447.

Losses.—FCC reported that a total of 581 AM stations—32% of all AM stations in operation—reported losses from broadcast operations in 1948. Most of these (442) were from the approximately 900 stations which began operation after World War II. Of about 320 stations which began broadcasting in 1948, 235 lost money during the year. FCC's records also showed that 259 of the year's unprofitable stations served as affiliates of national networks, and that 322 did not. Total losses of the 581 stations amounted to $9,350,955.

FM Finances.—FCC reported that 593 (85%) of the 700 commercial FM stations on the air at the end of 1948 were operated by licensees who also operated AM stations. Of these, 77 reported separate FM revenues, with income and expense data as follows:

	Aggregate	Average per station
Total broadcast revenues	$ 621,469	$ 8,070
Total broadcast expenses	2,153,659	27,970
Total broadcast loss	1,532,190	19,900

Of the 107 (15%) FM stations which had no AM affiliate, 89 filed financial data with the FCC, which summarized the information as shown below:

	Aggregate	Average per station
Total broadcast revenues	$1,126,208	$12,650
Total broadcast expenses	4,182,558	46,990
Total broadcast loss	3,056,350	34,340

FCC said only 7 of the 166 reporting EM stations reported profits for the year.

Estimated 1949 Time Sales.—*Broadcasting Magazine* placed the 1949 figure of time sales at approximately $429,000,000, a 3% gain over the 1948 official total. *Broadcasting Magazine* also estimated that revenues from the sale of talent, etc., would amount to about $22,000,000, bringing radio's gross revenues to $451,000,000. Incorporating these estimates, *Broadcasting Magazine*'s 1950 *Yearbook* offered 1948–49 comparisons of net time sales as shown in Table II.

Table II.—*Time Sales of U.S. Stations*

Class of business	1949 (estimated)	Per cent of total	1948	Per cent of total
National network.	$127,590,000	29.8	$133,723,098	32.1
Regional and miscellaneous networks	7,500,000	1.8	7,329,255	1.7
National and regional non-network time	112,000,000	26.2	104,759,761	25.1
Local	181,900,000	42.2	170,908,165	41.1
Total.	$428,990,000	100.0	$416,720,279	100.0

U.S. Programs.—The most popular AM network programs, segregated between daytime and evening, during the week of Nov. 1–7, 1949, were as shown in Tables III and IV, according to C. E. Hooper, Inc., creator of the Hooperatings-Radio Audience Measurement. The corresponding rankings of the same programs in 1947 and 1948 are also shown.

The giveaway program "fever" which seized the U.S. in 1948 continued to rage during the first part of 1949, then began to subside. In August, FCC made final its proposal to ban such programs on lottery grounds, adopting rules to become effective Oct. 1. At the time, the four major networks were carrying 38 giveaway programs which, according to estimates by *Broadcasting Magazine,* occupied $650,000 worth of air time each week and offered $185,000 worth of money and merchandise in prizes every seven days. Before the effective date, FCC suspended its rules, pending court tests of their legality.

Table III.—*Top Evening Hooperatings*

Program	Nov. 1-7, 1949, Hooperating	Nov. 1–7, 1948, position	Nov. 1–7, 1947, position

Radio columnists	1.9	3.5
Miscellaneous	5.4	5.0

By late 1949 the public already was beginning to tune out the giveaway, without waiting for a court order. "Stop the Music," one of the most popular giveaway shows, reached a peak 20.7 Hooperating in March but by November had dropped to 10.1, which ranked it 51st among all evening network commercial programs.

Mysteries meanwhile replaced variety shows as the dominant nighttime commercial program type. (See *Network Programs by Types,* below.)

Special Events.—The inauguration on Jan. 20, 1949, of Pres. Harry S. Truman and of Alben W. Barkley as vice-president was taken via radio and television to more viewers and listeners than ever before. In addition to domestic coverage, the state department's "Voice of America," the British Broadcasting Corp. and the French Broadcasting system beamed shortwave accounts overseas.

Vice-President Barkley figured in another widely followed broadcast-telecast ten months later, when he was married on Nov. 18 to Mrs. Carleton S. Hadley in St. Louis, Mo.

In the meantime, radio again went all over the world to give first-hand coverage of news events wherever they occurred, from wars and politics to sports and social affairs.

Network Programs by Types.—Table V shows the general composition of commercial evening programs broadcast on the four national networks during the week of Nov. 1–7, 1949, compared with the same week of 1948. The table was prepared from information supplied by C. E. Hooper, Inc.

Table VI shows the daytime division of network commercial time according to program types, also based on information from C. E. Hooper, Inc.

U.S. Manufacturing.—U.S. radio set production declined sharply in 1949. The Radio Manufacturers association, representing more than 80% of the industry, estimated the year's production by R.M.A. members and nonmembers as approximately 10,000,000 receivers (including about 1,000,000 FM). By comparison, 16,500,000 radio receivers were produced in 1948.

Receiver tube production also declined. The Radio Manufacturers association estimated production at 190,000,000 radio receiver tubes in 1949, compared with 204,720,378 in 1948.

U.S. Organizations, Employment, Regulation.—The year

REHEARSALS for four 1949 broadcasts of the radio drama series "Suspense," showing how much the players feel it necessary to act out their roles for more convincing performances, though they are unseen by their audiences

1949 saw the broadcasting industry take a major step to improve its competitive position in the growing battle for the advertising dollar. At its annual convention in Chicago, Ill., in April, the National Association of Broadcasters (N.A.B.), dominant trade organization, set up a full-time Broadcast Advertising bureau (B.A.B.) to "sell" radio aggressively on a level with competing media. B.A.B. commenced operations in midyear, under the direction of Maurice B. Mitchell, who had been in charge of the N.A.B. department of broadcast advertising.

Coincident with the establishment of B.A.B., the N.A.B. board of directors approved a $75,000 loan to Broadcast Measurement bureau, audience measurement organization sponsored by N.A.B., the American Association of Advertising Agencies and the Association of National Advertisers. The loan was to cover completion of B.M.B.'s second national audience survey, in progress in 1949.

In December, the three-year-old FM association, a promotional agency comprising some 200 FM stations, voted to accept an N.A.B. offer of merger, effective Jan. 1, 1950.

Broadcast Music Inc. (B.M.I.), an independent unit operating alongside the N.A.B., continued to function as radio's own music-licensing group.

The National Association of Radio Station Representatives (N.A.R.S.R.) also continued in operation on an expanding scope. N.A.R.S.R.'s charge that the major networks were violating FCC's network rules by representing some affiliates for the sale of spot advertising—a function of N.A.R.S.R. members themselves—at year's end was still undecided by FCC, which had completed hearings in January.

Employment.—A 17% increase in broadcast employment was reported by FCC in 1949, based on data filed by 1,613 AM stations and four national and three regional networks for a sample week of Oct. 1948. Full-time employment was 39,572. By comparison, the networks and 1,260 AM stations reported 34,720 full-time employees in a sample week of Oct. 1947.

Aggregate weekly pay rolls of networks and stations rose from $2,508,000 in 1947 to $3,003,111 a year later, a gain of approximately 20%, according to FCC's figures. The average weekly pay was $71.22 in the 1948 sample week, compared with $72.40 the previous year. Average work week was 40.27 hr. in the 1948 report and 39.4 hr. in 1947, exclusive of executives' hours, which were not reported.

Regulation.—The FCC in 1949 handed down several policy-making decisions, one of which reversed the long-standing *Mayflower* decision forbidding radio station owners to editorialize on the air. Henceforth, FCC said in a new decision, issued June 2, broadcasters may air their own views on controversial and other issues, provided they treat with "fairness" those who wish to present opposing viewpoints.

Another policy decision was FCC's repeal of the so-called

"Avco rule," which had required that contracts for the purchase of radio stations be advertised, so that anyone who wished to do so might offer to buy on the "same terms and conditions."

Still pending at the end of 1949 were other far-reaching questions, including (1) the "clear channel" case, involving the exclusivity of clear channels of AM radio and a proposal that clear-channel stations be allowed to operate with power up to 750 kw. instead of the existing 50 kw. maximum and (2) the qualifications of antitrust law violators to own radio stations.

Inter-American Agreements.—The North American Regional Broadcasting Agreement (N.A.R.B.A.), which had governed allocations among North American nations since 1941, expired on March 29, 1949. Conferences to negotiate a new agreement were opened at Montreal, Que., Canada, in September under a schedule set up prior to N.A.R.B.A.'s expiration; in December they were recessed, stalemated by U.S. refusal to accept Cuban demands for rights on scores of channels heretofore within U.S. priorities. The U.S. and Cuban delegations were scheduled to confer in Havana, Cuba, starting Feb. 1, 1950, in an effort to smooth out their differences, and the full N.A.R.B.A. conference was then slated to resume in the U.S. about April 1, 1950. Nations involved were the Bahamas, Canada, Cuba, Dominican Republic, Haiti, Mexico and the U.S.

(R. W. Cr.; S. Tf.)

International Developments.—Once again the international implications of the medium occupied the attention of radio organizations throughout 1949. The working out of the medium wave allocations agreed upon at the Copenhagen conference in 1948 proved to be both onerous to those countries who readily accepted its decisions and controversial where its provisions led to results not fully seen by the negotiators on the spot. As late as December, meetings were being held in Washington, D.C., at which the fulfilment of the plan hung in the balance, and there was no guarantee that the deadline of March 1950 would, in fact, be observed. The even more complex subject of short waves was argued for months at Mexico City, Mexico. Finally, in April 1949, 51 delegations accepted a plan, the first world plan of short-wave distribution ever to be agreed, which was based on what is known as "summer intermediate sun activity." The adaptation of the plan, which was passed to a technical committee, although bound to decrease the number of frequency hour availabilities by introducing proportionate reductions from country to country, would not involve the disappearance of programs already in being. Unfortunately, included in the 18 delegations who remained negative were both the U.S. and the U.S.S.R. Meanwhile in Europe steps were taken toward the formation of a European broadcasting organization which should be fully representative of the democratic powers. In 1949 two organizations existed, the Union Internationale de Radiodiffusion (U.I.R.), based in Switzerland and during World War II largely dominated by Germany, and the Organisation Internationale de Radiodiffusion (O.I.R.), based in Belgium and largely dominated by east European countries. From both of these organizations the B.B.C., largest and most powerful of the European radio bodies, stood aside. At Stresa, Italy, in the summer some progress was made toward ending the deadlock, the B.B.C. being represented in unofficial discussion with members of the U.I.R. On the international cultural side, there was good progress to record with the award of the first Italia prize, a competition for an original work for radio to which 12 countries contributed, including Czechoslovakia, Finland and Monaco. An international jury made the first award to France, for a musical farce entitled "Frederick the General," the second to Great Britain for a radio reconstruction of "The Old and True Story of Rumpelstiltskin" and the third to Monaco for "Lost Song," a radio film. The Italia prize was created a foundation and would be given, in alternate years, for musical and literary works. Further evidence of international co-operation came from the northern European states. In June, Danish, Finnish, Icelandic, Norwegian and Swedish representatives met in Stockholm, Sweden, and decided to embark on an ambitious series of relays, involving concerts, Nordic art, drama and literary chronicles. Continuous exchange of technical data was also agreed upon.

Great Britain.—As a result of intensive soviet jamming of B.B.C. broadcasts, the B.B.C. in collaboration with stations in the U.S. zone of Germany retaliated by bringing an unparalleled transmitter strength to bear on the U.S.S.R. More constructively, perhaps, the B.B.C. increased its listeners to "English by Radio" courses not only in western Europe but also in some east European states. More than 1,000 Bulgarian listeners, for instance, wrote to London for texts of a progressive course of lessons. From eastern Germany, too, came a heavy mail as the result of a new program intended to keep the population in touch with the outside world. Outside Europe, a new B.B.C. service was inaugurated in the autumn to Israel, in Hebrew, the first of its kind in the world. Within the British Commonwealth of Nations, separate transmissions were begun for India and Pakistan in place of the previous combined Hindustani service. Arrangements between the governments of the United Kingdom and Ceylon allowed for the use during eight-and-a-half hours every day of Radio Ceylon (formerly Radio S.E.A.C.) for transmitting B.B.C. programs to the far east.

Europe.—German developments were the most spectacular. In the U.S. and British zones it was decided that the only satisfactory coverage, after the Copenhagen plan came into operation, would be by frequency-modulation transmission on ultra-short waves. The industry was accordingly requested to produce receivers. If the plan went through, which seemed probable, Germany would be the first European country to introduce ultra-short wave broadcasting on a large scale. In the meantime, the Bavarian radio, with U.S. permission, became commercial; and in Berlin the U.S.-controlled R.I.A.S. instituted a system unique in Europe, whereby telephone subscribers by dialling a certain number were connected to a nonstop news service, recorded on magnetic tape, and changed three times daily. On the other side of the "iron curtain," more and more attention was paid to education, which, whether for the young or for adults, was made the vehicle of much party propaganda. In Poland, however, and to a certain extent in Czechoslovakia, this increasing use of the radio for political propaganda did not prevent the emergence of programs of good music. The French radio gave some time to the project of a radio university.

British Commonwealth.—As in Great Britain, broadcasting in Australia and Canada came under enquiry during 1949. A new control board in Australia, while approving the basic system, in which public service and commercial broadcasting services existed side by side, declared that many improvements were necessary to supply listeners with an adequate broadcasting service. In Canada a Royal Commission on Arts, Letters and Sciences was still sitting at the end of the year. To it both private broadcasters and the Canadian Broadcasting commission had submitted evidence, the former asking for equal rights with the C.B.C., the latter declaring that judgment in broadcasting matters should be based solely on public interest and calling for a fully national radio system, owned and supported by the public. South Africa's earlier declared intention to pursue commercial broadcasting as a new policy was now understood to involve no separate organization. The S.A.B.C. would remain in charge of three programs, of which the third would be commercial. India announced an eight-year plan for extending radio throughout India, serving ten times the former area and reaching 80,000 villages instead of the then 5,000. The government was to provide receiving sets and loudspeakers. In the colonies, interest in broadcasting was growing apace. It was understood that certain funds might shortly be made available for erecting new stations, especially in British West Africa and the West Indies. The B.B.C. was called into consultation by the Colonial Office and undertook service surveys for the government at home. (*See* also ADVERTISING; FEDERAL COMMUNICATIONS COMMISSION; TELEVISION.)

Railroads.

United States.—From the viewpoints of railroad management, the stockholders and the bond holders, the record of 1949 was distinctly discouraging. In comparison with 1948 there were substantial decreases in volume of traffic, operating revenues, net income and return on capital investment. The greatest decline was in the last quarter of the year. The number of loaded cars moved in October was the lowest in any October in the last 30 yr. The outlook for 1950 was not promising.

The following table shows the significant items in the income account of class I railroads (constituting about 95% of the total U.S. railroad mileage) for the 12 months ended Sept. 30, 1949, compared with the calendar years 1948, 1944 and 1929. The two years last named were chosen for comparative purposes because 1944 was the year in which war traffic was at its height and 1929 was a prosperous predepression year. The constructive year ended Sept. 30, 1949, however, does not reflect the adverse conditions of the last quarter of the year when, because of strikes in the coal and steel industries, there were further heavy losses in traffic and earnings. Nor does it reflect, except for one month, the higher cost of the 40-hr. week which became effective on Sept. 1. The net income of the calendar year 1949, therefore, was less than that of the constructive year ended Sept. 30.

The decline in railroad traffic was due mainly to three factors: (1) the unsettled business conditions which slowed up production and influenced manufacturers and merchants to reduce inventories and to use caution in future commitments; (2) further intensification in competition from carriers by highway, water, pipe line and air; and (3) strikes of coal miners, steel workers and others, which not only reduced rail tonnage in coal, coke, ore, steel and other raw materials, but also cut down the output of manufacturers dependent on those basic commodities.

The net income of railroads was reduced by two unfavourable factors: (1) the decline in operating revenues; and (2) the inability, because of higher wage rates and advances in the prices of materials, to reduce operating expenses in proportion to the loss in operating revenues. Increases in freight and passenger rates were of material assistance, but they lagged behind the cost increases and were not sufficient entirely to overcome the effects of high costs. The return of about 3% on capital (less depreciation) was but one-half of the 6% minimum which railroad spokesmen assert is necessary to maintain credit and to enable the railroads to finance improvements vital to the continuation of adequate service.

Condensed Income Account: U. S. Class I Railroads

Item	12 months ended Sept. 30, 1949	Calendar years 1948	1944	1929
	(Millions)			
Freight revenue	$7,422	$7,967	$6,999	$4,826
Passenger revenue	901	964	1,790	874
Total operating revenues	9,018	9,672	9,347	6,280
Total operating expenses	7,657	7,472	6,282	4,506
Taxes	910	1,029	1,846	397
Net railway operating income	752	1,002	1,106	1,252
Net income after charges	474*	747	667	897
Return on investment less depreciation	3.19%	4.24%	4.71%	5.24%
	(Billions)			
Revenue ton-miles	$568†	$638	$737	$447
Revenue passenger-miles	37†	41	96	31

*Estimated. †Twelve months ended Aug. 31.

GAS TURBINE-ELECTRIC locomotive built by the American Locomotive and the General Electric companies, completing road test runs in June 1949. The first such unit built in the U.S., it produced 4,500 h.p. and could haul 85 loaded freight cars as rapidly as 65 m.p.h.

The intensification of the competition with which the railroads were confronted was evidenced in the growing proportion of total intercity tonnage carried by highway, pipe line and inland waterway carriers. According to figures of the Interstate Commerce commission's bureau of transport economics and statistics, the railroad proportion of total intercity ton-miles fell from 66.9% in 1947 to 64.2% in 1948; the truck share grew from 7.8% to 8.7%; the inland waterways, including the Great Lakes, carried 14.8% in 1947 and 15.3% in 1948; and the pipe line proportion rose from 10.5% to 11.8%. In passenger service the railroad proportion of total intercity passenger-miles by all carriers except private automobiles in 1947 was 59.5%. In 1948 it was reduced to 57.2%. The bus proportion increased from 30.5% to 32.3%. The inland water carriers rose from 2.3% to 2.4%; and the air lines increased their share from 7.7% to 8.1%. (The air proportion of first-class long distance passengers was very much greater.) The bureau estimated that the passenger-miles by private automobile in 1947 were 3.47 times as great as the combined total of railroads, buses, aeroplanes and water carriers. The comparative ratio in 1948 was 3.92 times. The above figures are for 1948, compared with 1947, but there was strong evidence that the 1948 trend away from the rails was continued in 1949.

The gross capital expenditures of class I railroads in roadway, structures, terminal, communication equipment, locomotives and cars in 1949 were estimated at $1,297,000,000. Of that amount, $325,000,000 was devoted to fixed property, and $972,000,000 went into diesel locomotives (to replace less efficient steam power), freight cars and passenger cars of modern design. Out of 1,577 new locomotives installed during the first ten months of the year, the diesels numbered 1,524. Of the locomotives on order on Nov. 1, the diesels were 812 out of 833. During the 12 months ended Oct. 31, 1949, the number of additional streamlined passenger trains was 29, bringing the total number of those modern trains to 147, with a complement of 3,054 cars for 292 sets of equipment. Out of a total of 127 class I railroads, 43 had one or more of such trains.

Practically all of the capital improvements in roadway and structures were financed from earnings—net income "ploughed in" instead of being declared in dividends. Because of low railroad earning power it was practically impossible to raise capital through the sale of stock. The new locomotives and cars were financed by the sale of equipment trust certificates.

The situation with respect to the adequacy of current maintenance of railroad fixed property was not favourable. In a report of the engineering section of the Interstate Commerce commission's bureau of valuation, released in Nov. 1949, the amount of deferred track maintenance: *i.e.*, work which should have been done but was not done because of financial or other reasons, amounted on class I railroads to $875,000,000, an increase of $315,000,000 over the deferred maintenance on Dec. 31, 1948. That something of the same nature was true of equipment maintenance was indicated by figures of the Association of American Railroads which showed that on Oct. 1, 1949, the freight cars in "bad order" were 7.3% of the total. The comparable figure of a year earlier was 4.8%. For locomotives the "bad order" figures were 8.4% in 1949; 7.2% in 1948. These amounts of deferred maintenance indicate that the net income of 1949 was overstated in whatever degree the operating expenses of the year were held down by putting off a part of the normal outlays for current maintenance.

On June 30, 1949, the mileage of railroads of all classes in the hands of receivers or trustees was 13,736, or 5.6% of the total. On the same date in 1948 the bankrupt mileage was 15,100. The Missouri Pacific, which had been in trusteeship since 1933, accounted for about one-half of the total bankrupt mileage. The only notable addition to the list of bankrupt railroads was the Long Island. The Central Railroad Company of New Jersey emerged from trusteeship in June.

In the field of relations between the railroads and the government the following may be noted as happenings in 1949:

1. The implementation of the Bulwinkle bill, enacted in 1948 to legalize the conference method of rate-making by railroads and highway carriers, under the control of the Interstate Commerce commission, had its first step in the commission's approval of the application of western roads for approval of their rate-making associations and other joint agreements. Applications from railroads in other sections and from trucking associations were pending at the close of the year. In the case of the western roads the commission apparently was not impressed by the view of the department of justice, which had opposed the enactment of the Bulwinkle bill, that the conference method of rate-making unduly restrained competition between carriers.

2. Beginning on Nov. 5 the Interstate Commerce commission held hearings on the government claims for reparation (refunds) for alleged overcharges by railroads on the large volume of government freight moved by rail during the war years. The reparations, if granted in full, would require the railroads affected to turn back to the government a sum estimated to be in excess of $2,000,000,000. Inasmuch as the net current assets of all class I railroads on Aug. 31, 1949, were $1,300,000,000 and inasmuch further as their total net income was $747,000,000 in 1948 and $474,000,000 in 1949 (year ended Sept. 30), the seriousness of the government claims is apparent. If reparations were to be granted on the scale urged by the government, railroad bankruptcy on a large scale would be almost certain. The hearings were adjourned on Dec. 5 to March 20, 1950.

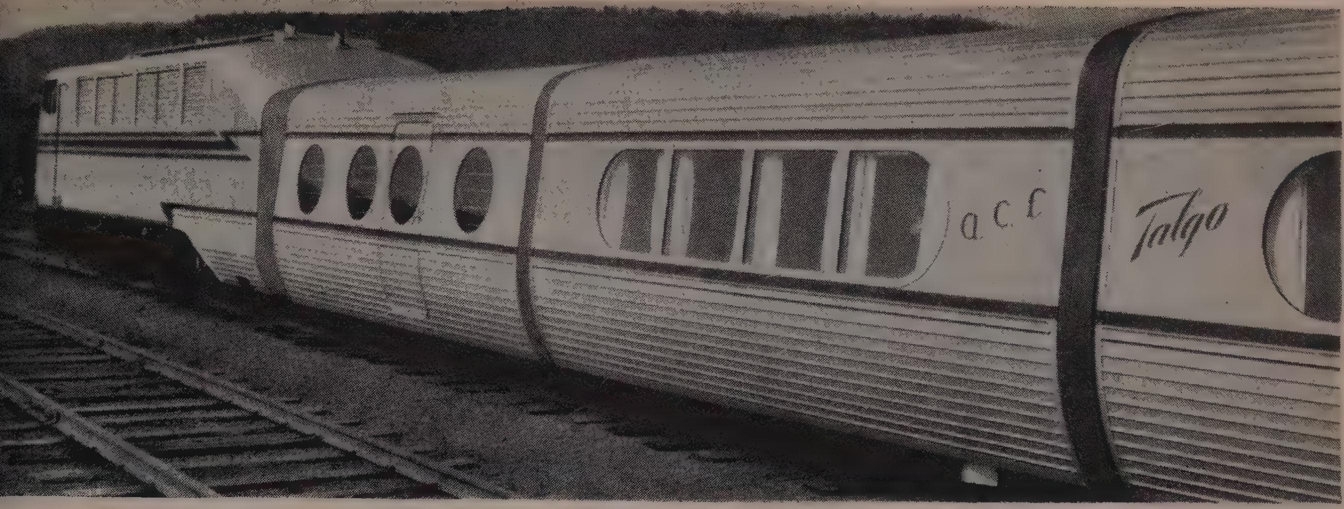
In order to offset wage increases and high costs of materials, the railroads made several applications to the Interstate Commerce commission in 1949 for authority to increase freight and passenger rates. The commission responded favourably but not to the full extent requested. In January the railroads were benefited by an increase of 5.2% in freight rates, authorized in December. That was designated as an interim increase to afford partial relief while the commission deliberated further. The request had been for an increase of 13%. The commission's final decision, in August, was to permit, effective Sept. 1, an average advance of 9.1%, inclusive of the 5.2% interim increase effective in January.

An increase of 12.5% in passenger fares, exclusive of suburban service, was sought by the eastern railroads in June. It was approved in full, effective Nov. 28. On the question as to whether the railroads, by such a rate advance, would be "pricing themselves out of the market," the commission accepted the opinion of railroad traffic officers that losses by diversion of passengers to other forms of transportation would be much less than gains in revenue from traffic which would be held. A minority of the commission, however, expressed the view that the higher fares would not be likely to bring in additional revenue and that "vacant seats rather than inadequate fares are the real cause of passenger deficits." In addition to this general increase in intercity fares advances were asked and authorized in suburban fares on individual railroads serving New York, N.Y., Chicago, Ill., and Boston, Mass. Further applications affecting suburban service were pending at the close of the year. In general, the scale of all passenger fares in Dec. 1949 was 44% higher than in 1939 in the east and 25% higher in the country as a whole.

In the field of labour relations, the railroad year 1949 had the following notable developments:

1. In March the nonoperating unions (trackmen, shopmen, stationmen, clerical forces and others except train and yard crews) were given a 40-hr. week with pay for 48 hr., plus an increase of 7 cents in the hourly rate. This was equivalent, in the case of a man who had been paid $1 per hour, to an increase to $1.27 per hour. The new basis gave him $50.80 per week of 40 hr. in contrast to $48.00 per week of 48 hr., an increase of 27% in the rate per hour. The actual effect of the new basis, however, was not as great as 27% because, after intensive study and rearrangements, it was found that a considerable part of the work formerly done on Saturday could be spread over the first five days of the week and that activities in track work, shop work and office work could be substantially curtailed on Saturday. Furthermore, the new basis of pay led to further use of labour saving machinery in maintenance and office work and acted as a spur toward higher efficiency in supervision. The principle of the 40-hr. week was not applied to train crews, who were paid on a mileage basis, nor to yard switching crews. A demand that the 40-hr. week should be extended to yard switching crews, together with changes in rules which would add to compensation, was in process of negotiation in December. The shortening of the work week and the further increase in the hourly rate to the nonoperating employees was the result of recommendations by a fact finding board and governmental mediation after direct negotiations between management and unions had failed.

2. The separately made demands of two unions for the employment of an additional engineman and an additional fireman on diesel locomotives were refused by management. Strike threats led Pres. Harry S. Truman to appoint fact finding boards, and in both cases the boards found no justification for the employment of additional men. The findings of the boards, however, were not accepted by the two unions, and the matter



THE "ACF-TALGO," a passenger train built by the American Car & Foundry Co. in 1949, modelled on the Spanish "Patentes Talgo." Its over-all height was almost four feet lower than current streamliners and it was almost 75% ighter, due to its design and all-aluminum construction

was pending in December.

3. Strikes tied up the operation of three separate railroads n 1949. The first, on the Wabash, was called in protest over delay in the settlement of an accumulation of grievances. The strike lasted eight days. The second, on the New York, Ontario and Western, was caused by the unwillingness of the trustees, because of the financial inadequacy of the bankrupt road, to put nto effect the wage increases granted by other railroads. The stoppage lasted 11 days. The most serious of the three was the strike of train service employees on the Missouri Pacific in September against delay in settlement of disputes over the interpretation of rules governing compensation. It lasted 45 days, completely tied up the operation of the railroad and brought hardship to sections of the southwest dependent on the Missouri Pacific for rail transportation. The settlement came after a report by a fact finding board, intervention by the governors of the several states affected and an agreement by the unions to arbitrate the disputes not settled by collective bargaining during the tie up.

4. The strikes of coal miners and steel workers in the second half of the year had very serious effect upon railroad traffic and revenues. The losses in traffic brought about curtailment in train service and the indefinite furlough of upward of 100,000 railroad workers. (*See* also Disasters; Interstate Commerce Commission; National Mediation Board; United States.)

(W. J. C.)

Chicago Railroad Fair.—The Chicago Railroad fair of 1949 set a new attendance record by attracting 2,732,618 visitors. Attendance in the second year thus exceeded the 1948 total of 2,500,813 visitors and brought the total attendance for the two years of the fair to 5,233,431.

As in 1948, the most popular feature of the 1949 Railroad fair was the "Wheels a-Rolling" pageant, which depicted the history of transportation over a period of nearly 300 yr. The paid attendance for 393 performances (out of a possible 400) was 1,450,068, giving a total gate of 2,619,545 in its two-year run. The pageant traced the growth of the United States from a colonial outpost to a mighty nation and showed the leading role played in this growth by railroads and the pioneers whose vision and industry made the railroads possible.

Contributing largely to the pageant's effectiveness was the four-dimensional element of time. Rather than a mere three-dimensional display of historic vehicles, "Wheels a-Rolling" re-created the time in which they actually were in use and reenacted the operation amid the authentic costumes, lighting and other trappings of each succeeding era. (L. R. L.)

Great Britain.—The financial results of the first year's workings of the British railways operated by the railway executive were published in 1949; they yielded net receipts of £26,257,737 in 1948, which were equivalent to an operating ratio: *i.e.*, percentage of working expenses to gross receipts, of 92%, but this sum was offset almost £4,000,000 by losses on road collection and delivery services. The net traffic receipts from the railway executive's steamship services, however, totalled nearly £3,000,000. The nominal amount of 3% Guaranteed British Transport stock, issued as compensation for the railway undertakings now vested in the British Transport commission, was nearly £927,500,000, but statistically it would be inaccurate to relate this to the net traffic receipts, because of transfers of docks, hotels and other railway-owned property to other executives. The final debit balance in net revenue account for 1948 of the commission's total undertaking was £4,700,000, and the annual report prophesied a deterioration in the financial situation for 1949; costs for labour and materials, in fact, continued to rise, and railway traffic receipts, more especially on the passenger side, to fall, actually by more than £6,000,000 during the first nine months of 1949.

There was no change in the level of charges, which had not been raised since 1947, but detailed studies had long been in hand with the object of designing a unified classification for freight by rail and road as part of a national system of transport charges.

Demands for wage increases except in minor instances were refused by a government appointed conciliation board, and 1949 was free of major labour disputes in the railway industry.

Interregional tests carried out with various classes of locomotives in 1948 provided useful data for the coming design of a few standard types for the British railway system. There was no freight car shortage, although output in 1949 was restricted by lack of steel. As regards track, a new standard was adopted using the flat-bottomed, or Vignoles, type of rail in place of the traditional British bullheaded rail held in chairs. Savings were expected in maintenance though the initial cost per mile was considerably higher, but shortage of labour for track forces and increased wage rates altered the economic balance between the two types of track. The use of prefabricated track for renewals was carried further in Britain than elsewhere.

In Northern Ireland the Ulster Transport authority took over the former London, Midland and Scottish railway in Ulster from the British Transport commission, and the Great Northern railway, providing the link between Belfast and Dublin, and so crossing the frontier, found itself in financial difficulties. In Ireland the transport system was the subject of an investigation which led to proposals to nationalize the Irish Transport company.

Europe.—The financial situation of the French national railways (S.N.C.F.), reported to be operating at an annual deficit of over £20,000,000, gave cause for considerable anxiety in 1949, and important changes occurred in the highest administrative posts. The government's proposals to deal with this question were published in Nov. 1949 in the form of decrees. They envisaged the close co-ordination of rail and road transport, the preparation of new tariff scales for both rail and road and the closing on a major scale of branch lines to passenger traffic. The growth and progress of the Auxiliary Transport Operating company (S.C.E.T.A.) was most satisfactory. In Paris a Paris Transport board was set up.

On the Belgian national railways (S.N.C.B.) electrified services were inaugurated between Brussels and Charleroi in October, marking a further stage in the large-scale scheme for main-line electrification; progress was made on the Ligne de Jonction linking Brussels-Midi with Brussels-Nord.

In the Netherlands the conversion to electric traction of the Maastricht-Eindhoven-Heerlen main line was completed in May 1949, involving 90 route-mi. This change-over was expected to reduce coal consumption by 300,000 tons.

In western Germany the improvement in facilities offered opportunities for the acceleration of international services in which the German railway (Bundesbahn) occupied a key position. The reconstruction of some of the Rhine bridges and the great strides which were made in Germany toward regaining the famed prewar efficiency of the Reichsbahn were noteworthy. Nearly 1,000,000 freight cars were loaded in Dec. 1948, as against only about 718,000 in Jan. 1948, and about 1,000,000 were placed for loading in June 1949 in the western zones; the financial situation, however, remained serious.

In Switzerland about 95% of the Swiss Federal railways were being electrified. It was deemed essential to develop some of the hydroelectric resources of the Gotthard to supplement the Amsteg and Ritom power stations.

In Spain 60 mi. were completed in the link between Lerida and the French frontier, and the Spanish national railways placed large orders for steam locomotives with Britain.

Italian state railways did fine work in postwar reconstruction. Damage was calculated as equalling 75% of the prewar capital investment of 49,500,000 lire. On a 1949 line basis the damage equalled more than £500,000,000 or 900,000,000,000 lire; by 1949, nearly 500,000,000,000 lire had been expended on reconstruction. Specific items completed in 1949 were the Pontelagoscuro bridge across the Po, costing 505,000,000 lire, and the new station at Verona. Marshall aid, through the European Recovery program, provided material assistance in framing these and other projects. Railway traffic reached 90% of the prewar level, and more than 5,000 passenger coaches were in service.

In Norway the conversion of another section of the Sorland railway in June to electric traction provided the Norwegian state railways with an electrified route from Oslo to Stavanger, except for the westernmost section Flekkefjord-Stavanger. Since 1938 the system's route mileage had increased 15%, and freight traffic was approximately 40% above prewar.

New construction in Yugoslavia included a 34-mi. standard gauge line between Kumanovo and Ovče Polje, and conversion to standard gauge of the 145-mi. Skoplje-Ohrid section proceeded. The relaying of the second track of the Belgrade-Zagreb main line was completed westward by April 1949.

In Albania, the 26-mi. standard gauge Durrës-Pecinj line and the connecting Durrës-Tiranë section of 18 mi. were to be completed in 1949. The Greek state railways route from Athens to Larissa was reopened in July; thus with two exceptions, Papapouli-Katerine and Skydra-Agia, the whole of the state railways system was reopened.

In Bulgaria a 22-mi. line between Lovech and Troyan was opened; there were also developments in the Pernik coal area and at Orekhvo on the Danube.

Russian developments were indefinite; but Kharkov was regarded as the centre of the diesel locomotive construction industry, and electric traction was inaugurated on the Nikopol-Dolgintsevo 74-mi. section near Odessa and on the Poti-Samtredia 28-mi. line just prior to 1949.

Asia.—Rehabilitation continued in Burma and Malaya, and the Palestine railways were extended. In China the position was confused, but information was available concerning Pakistan and India. As yet there were no through services between western Pakistan and India, though eastern Pakistan was served by through trains from Calcutta; speeds were still below the prewar level. Traffic volume was improving on the North Western railway of Pakistan, and receipts were double those of the 1940–47 period. Pakistan locomotives were being converted to oil burning. In India a surplus was expected from railway operation in 1949–50, and works under construction included a new line to provide a direct rail link with Assam. On the Great Indian Peninsula railway, the Mathura-Delhi route was being widened, and new all-metal coaching stock built in India was introduced.

Ceylon railways had long suffered from chronic deficits; the situation in 1949–50 was to be no exception; the system was heavily indebted to the government, but improvements were being effected.

The latest Iraqui state railways report referred to the success of its air subsidiary which was formed in 1946, to the progress made with the 70-mi. extension from Kirkuk to Erbil, a metre gauge line, and to new bridgework over the Euphrates. Orders had been placed in Britain for additional steam motive power.

Africa.—In Egypt the proposed separation of the railways and state budgets marked a return to earlier policy; in 1940 the policy was reversed because, it was claimed, no advantage accrued. Though Egypt adhered to steam traction, and new units were being received in 1949, the Tunisian, Moroccan and Algerian railways were all converted to diesel traction; new diesel-electric locomotives of 1,500 h.p. were working the Kenadsa coal trains in Morocco, and new freight cars were imported. In Algeria, 40 new diesel-electrics were placed in service, and the expressed intention was to dispense with steam locomotives; some sections of line were being converted to electric traction.

In Tanganyika a new railway was under construction in the Southern Province, as was also a branch from Kaliuwa to serve the lead mines. New locomotives for the Nyasaland-Trans-Zambesia railways were entering service, and in Rhodesia the new railway board for government-owned railways took charge in November. The Beira section became Portuguese property in April 1949.

The South African railways, so long a profitable concern, encountered financial difficulties, a deficit of £6,000,000 being recorded for 1948, and the Rates Equalization fund fell 60% in five years. Technical progress, nevertheless, continued, as for instance in the electrification in the Belleville area, and the large Prospect classification yard was being mechanized so as to handle 2,500 cars daily.

South America.—Nationalization of the British-owned railways in Uruguay became law in Jan. 1949, and the sale of the much larger British-owned lines in Argentina was finally completed in May. Large orders for diesel traction units were placed by Argentina in Hungary and the United States, the former for rail cars and the latter for locomotives. The financial situation on the railways caused concern, and a commission was at work to study a general revision of passenger fares and freight rates.

In Brazil, agreement was reached in April for the sale of the Leopoldina railway to the Brazilian government for about £10,000,000; arrangements were made to terminate the lease of the government-owned Great Western of Brazil, a 1,040-mi. metre gauge system. New railway construction continued in Brazil under the plan of the national railways department, with the primary object of linking the several state capitals and the national capital. New 3,000 h.p. electric locomotives were being placed in service on the Brazilian-owned former São Paulo railway, electrified on the 3,000 v. D.C. system.

Canada.—In Canada the Canadian National railway took over the Newfoundland railways. Other developments included the construction of the first mechanized classification yard by the Canadian Pacific in the Montreal area, and the building by the Canadian National of a large new freight station, Bonaventure station, at Montreal. The C.P. was entirely dieselized and new electric locomotives were placed in service at Montreal by the C.N.. A royal commission was appointed to report on the dominion's transport services in Feb. 1949.

Australasia.—The New Zealand government railways continued to operate at a heavy deficit, but train services were accelerated.

The major event in Australia was the publication of the important Elliot report on the Victorian railways, proposing the setting up of a Victorian Transport board. South Australia was undertaking the gauge conversion of part of its mileage, and pulverized coal was being developed for locomotive purposes in Victoria. (*See* also ELECTRIC TRANSPORTATION.)

Rayon and Other Synthetic Fibres.

Production of rayon in the world during 1949 was about 2,690,000,000 lb., compared with 2,477,000,000 lb. in 1948. The United States share of the 1949 production was 36.9%, compared with 45.4% in 1948, 56.7% in 1945 and 19.1% in 1940.

Table I.—*United States Rayon Production*
(In millions of pounds)

	1944	1945	1946	1947	1948	1949
Rayon filament yarn	555	624	677	747	856	800
Rayon staple fibre	168	168	177	228	268	178

Of the other producing countries, the United Kingdom's monthly average in 1949 was 23,400,000 lb., compared with 19,500,000 lb. in 1948, an increase of about 20%. In the first six months of 1949, 132,600,000 lb. was produced in western Germany, compared with 55,600,000 lb. in the same period of 1948. France produced 54,400,000 lb. of rayon filament during the first six months of 1949, or a monthly average of about 9,000,000 lb., compared with a monthly average of 8,000,000 lb. in 1948. Japan, a large producer before World War II, gave indications that its 1949 goal of 128,000,000 lb. of filament and staple might be reached. More than 53,000,000 lb. were produced in the first half year, of which 30,000,000 lb. were filament and 23,000,000 lb. were staple. In 1948, the half year's total was 30,200,000 lb. Swiss rayon yarn production continued at about the same pace as in 1948 for the filament type, with a decrease in staple. For 1949, it was estimated that the total output would be 16,400,000 lb. of filament and 12,000,000 lb. of staple.

Rayon prices, in the United States, reflected the downward trend of other textile prices. The filament rayon averaged 73 cents per pound as against 75 cents per pound in 1948. Spun rayon yarn prices had a greater drop, the average for the year being 72 cents per pound as against the 1948 average of 90 cents per pound.

As was the case with rayon yarns, output of rayon fabrics in the United States also decreased. Total production was 1,950,000,000 yd., 11% less than the 1948 production of 2,190,000,000 yd.

Table II.—*U. S. Production of Rayon Broad Woven Fabrics*
(By types Except Tire Fabrics)
(In millions of linear yards)

Year	All-filament	All-spun rayon	Comb. filament and spun rayon	All other rayon mixtures
1939	998.0	176.8	22.8	97.2
1944	1,103.1	156.1	154.6	159.6
1945	1,028.7	161.9	159.1	170.4
1946	1,047.1	190.9	172.3	253.0
1947	1,210.3	294.4	182.2	170.0
1948	1,343.0	377.0	256.0	182.0
1949*	1,267.0	322.0	176.0	155.0

*Nine months actual, three months estimated.

In the United Kingdom, rayon fabric production increased during the year. Rayon woven cloth production amounted to about 564,000,000 yd. for the year, compared with 508,000,000 yd. in 1948.

From May 25 to July 6, 1949, a group of British rayon weaving workers visited the U.S. to study production methods, sponsored by the Anglo-American Council on Productivity of the European Recovery program. The group of fourteen men and two women included mill superintendents, loom fixers and weavers. The productivity team, as it was called, reported that in general no revolutionary differences in procedure were noted between the two countries, except that the U.S. operation was on a mass production basis. The most notable differences were: the preponderance of male labour in the U.S. mills, as contrasted with British mills where most employees were women; the acceptance by U.S. labour unions of new methods of reducing cost of production through higher work loads and speedier equipment; and the measures taken to avoid wasting the time of the worker through making it unnecessary for him to leave his machine.

In the marketing of rayon, discussions arose again in the U.S. as to the application of the name "rayon" to the acetate rayon yarns. Because of basic differences between the viscose-cuprammonium types (known as regenerated) and the acetate type, a sharp distinction had grown in the trade in describing popular mixtures of the two types under the words "rayon and acetate," and efforts had been made either to adopt a new coined name for the acetate type yarns, or call them simply "acetate." Technical societies, both in the U.S. and elsewhere, had discussed the subject in the previous two years without agreement. At the close of 1949, however, it was indicated that the Federal Trade commission in Washington, D.C., would be asked to approve a change in nomenclature to follow what had become an unofficial trade recognition, that "acetate" was a distinctive fibre from the original viscose type, which had been the prevailing yarn when the word "rayon" was adopted in 1937 by the commission. The commission, in turn, indicated that if the industry showed unanimity of opinion and practice on the pro-

POPULAR-PRICED NYLON BLOUSE marketed in 1949; dresses and men's shirts made of nylon were also mass-produced during the year as new dyes and weaves for nylon fabrics were perfected in greater variety

posed change, there would be an inclination to confirm it officially.

Nylon and Other Fibres.—The renewed agitation for the change was indirectly caused by the wide popularity in 1949 of nylon fabrics. Production of all-nylon fabric jumped from 32,500,000 yd. in 1948 to 87,700,000 yd. in 1949 (last three months estimated). In addition, there was a large quantity of nylon-and-acetate-rayon fabric made for which no yardage statistics were available. It was commonly of the mixture of 12% nylon and 88% acetate rayon. Some complaints were made to the Federal Trade commission that articles made of the nylon-and-acetate-rayon fabric were being marketed as nylon; or, if the words "acetate rayon" appeared at all, the reference was usually to "acetate" only, and in very small letters. The National Better Business bureau and other agencies called attention to the FTC's requirements that rayon content be identified properly, and that fibres used in mixtures be mentioned in order of their importance by weight. The ensuing discussion about fibre identification led to the reopening of the issue about identifying the two types of rayon, as well as nylon and other man-made fibres. It was expected, at the close of the year, that the Federal Trade commission would hold a trade hearing on the subject some time in 1950.

The newest fibre in commercial production, Orlon, was shown chiefly in curtain materials during 1949. Difficulty in finding commercially practicable dyes limited its introduction into other fields. In the course of the year, the Union Carbide and Carbon corporation announced the production of Dynel, a staple fibre produced from a copolymer of vinyl chloride and acrylonitrile. When extruded, the fibre was stretched, preshrunk, crimped and cut to staple length. Its dimensional stability was above the boiling point of water, which meant that it would neither shrink nor stretch in washing. The fabrics produced resembled cashmere, coarsehair or any grade of wool between the two, and this new fibre was expected to hasten the use of man-made fibres in the woolen and worsted industry. Its quick drying, easy washability and fire resistant qualities, combined with long wear, were expected to find a special place in knitting such articles as sweaters and socks, and in weaving blankets and insulation materials, as well as men's and women's suitings. Dynel staple was obtainable in both long and short staple, and blended well with the older fibres.

Reconstruction Finance Corporation.

The Reconstruction Finance corporation, originally created by the congress Jan. 22, 1932, has succession through June 30, 1956 (public law 548, 80th congress, approved May 25, 1948).

A board of directors consisting of five members appointed by the president by and with the advice and consent of the senate is responsible for management of the corporation. The board consisted in 1948 of Harley Hise, chairman, Walter Lee Dunham, Harvey J. Gunderson, Henry A. Mulligan and W. Edward Willett. Their term was to expire June 30, 1950. At that time two directors were to be appointed for a term of one year; two for a term of two years; and one for a term of three years. Thereafter, the term of the directors would be for three years. The president designates one of the directors to serve as chairman of the board.

The outstanding capital stock of the corporation had been reduced from an original amount of $500,000,000 to $100,000,000. In addition to retirement at par of $400,000,000 of its capital stock a dividend amounting to $307,391,555 had been paid over to the United States treasury.

The purposes of the corporation are to aid in financing agriculture, commerce and industry; to encourage small business; to help in maintaining the economic stability of the country; and to assist in promoting maximum employment and production. To serve the objectives of the congress, the RFC is authorized to purchase the obligations of, and to make loans to, business enterprises, including railroads and air carriers, either directly or in participation with banks or other lending institutions; to make loans to financial institutions; to subscribe for or make loans upon nonassessable preferred stock of insurance companies; to purchase the securities of, or make loans to, municipalities and other public agencies to assist in financing projects authorized under federal, state or municipal law; and to make loans because of floods or other catastrophes.

The corporation is also authorized, pursuant to the provisions of the National Housing act, as amended, to make loans to, or purchase the obligations of, business enterprises producing prefabricated houses or prefabricated housing components, or for large-scale modernized site construction.

Total investments, loans, purchases and commitments made subsequent to June 30, 1947, may not exceed $3,550,000,000 outstanding at any one time.

Under the provisions of the RFC act, the corporation may not make loans to business enterprises unless the financial assistance applied for is not otherwise available on reasonable terms and such loans must be so secured as to reasonably assure repayment.

During the 1949 fiscal year 8,356 business enterprises applied to RFC for financial assistance in the aggregate amount of $1,456,000,000. Over the same period the corporation authorized 3,509 business loans amounting to $349,900,000 and bank participation in 1,085 of these loans amounted to an additional $39,600,000.

Participation loans are of two general types, immediate participations and deferred participations. In the case of an immediate participation, the entire loan is disbursed by the RFC and the bank immediately purchases an agreed percentage or the bank makes the disbursement and RFC purchases a portion of the loan. A deferred participation contemplates an agreement between the RFC and a bank under the provisions of which the bank disburses the loan and RFC agrees to purchase a stipulated percentage of the unpaid balance when and if called upon to do so by the bank. In deferred participation loans RFC's participation is limited to 70% of the balance of the loan outstanding at the time of disbursement in instances where the total amount borrowed is $100,000 or less and the corporation's participation may not exceed 60% of the balance outstanding at the time of disbursement in cases where the total amount borrowed is over $100,000.

Of all business loans authorized during the fiscal period, approximately 88% of the number were for $100,000 or less and 52% did not exceed $25,000. At the close of the fiscal year 5,187 business loans were outstanding in the aggregate amount of $384,345,000. In addition, the corporation had outstanding at the end of the fiscal year commitments to participate in 6,999 business loans made by banks totalling $173,819,000.

Other loans or purchase of obligations authorized during the period included those to municipalities and other public agencies amounting to $27,300,000; catastrophe loans aggregating $3,800,000; railroads $968,000; and loans on preferred stock of insurance companies $3,000,000. As of June 30, 1949, total loans and investments outstanding aggregated approximately $998,522,000.

The Federal National Mortgage association, an RFC subsidiary, maintains a secondary market for the purchase at par and accrued interest of mortgages on homes and rental housing projects insured by the Federal Housing administration or guaranteed by the Veterans' administration. Among other requirements, mortgages offered to the association for purchase must have been insured or guaranteed subsequent to April 30, 1948, the original principal amount may not exceed $10,000 for each family residence or dwelling unit; and the seller must be the original mortgagee. The purpose of the program is to encourage the construction of individual homes and rental housing projects and investment by private lenders in such home mortgages.

During the fiscal year 1949, the association purchased 22,554 home loans guaranteed by the Veterans' administration amounting to $126,000,000 and 40,408 home mortgages insured by the Federal Housing administration aggregating $297,500,000. At the close of the fiscal year the association had outstanding commitments to purchase 29,554 additional VA mortgages totalling $204,800,000 and 19,007 additional FHA insured mortgages in the aggregate amount of $282,000,000. As of June 30, 1949, the association held 22,520 mortgages guaranteed by the Veterans' administration amounting to $125,000,000 and 47,992 mortgages insured by the Federal Housing administration totalling $339,376,000.

In 1949 more than 100,000 FHA insured mortgages and VA guaranteed mortgages owned by the RFC and Federal National Mortgage association were offered for sale to eligible purchasers at prices ranging from $100\frac{1}{2}$ to $102\frac{1}{4}$ to yield from approximately 4% to approximately $4\frac{3}{4}\%$.

The government-owned tin smelter at Texas City, Tex., was constructed by Reconstruction Finance corporation as a national defense measure in 1942 and represented an investment of approximately $10,000,000. The corporation was authorized to operate the smelter and to perform other related functions until June 30, 1951. These facilities were operated for the account of the corporation during the fiscal year 1949 and over that period the corporation's sales of tin amounted to $159,000,000.

RFC is charged with the responsibility of carrying on the production of synthetic rubber in the government-owned manufacturing plants and other related activities in connection with the program. Of the original 51 manufacturing plants and related facilities which were financed by the corporation, 18 were engaged in active production on June 30, 1949. These facilities were being operated for the account of RFC and sales of synthetic rubber by the corporation for the fiscal year amounted to $173,400,000. In addition to the active plants, 11 such facilities and projects costing approximately $193,700,000 were held in stand-by condition. During the year, eight of the copolymer plants were expanded for the production of "cold rubber" and at the close of the fiscal year five of them had produced a total of 24,240 long tons of the product.

The five government-owned fibre plantations located in Central America, Panamá and Haiti were continued in operation for the account of RFC. During the 1949 fiscal year approximately 40,634,000 lb. of fibre were produced and 46,400,000 lb. of the product were sold for $10,140,000.

Plants and other facilities acquired by RFC during World War II, and property, plants and equipment formerly belonging to Smaller War Plants corporation (the latter transferred to RFC for liquidation purposes) were disposed of during the 12 months ended June 30, 1949, for a consideration of approximately $54,524,000. At that time the balance of such property represented an investment of approximately $78,776,000, exclusive of the synthetic rubber plants, the tin smelter and the fibre plantations. Liquidation of these properties was to be continued as rapidly as circumstances permitted.

On June 30, 1948, the corporation had 5,337 employees, compared with a peak employment of 12,299 in July 1946. As of June 30, 1949, 1,499 employees comprised the Washington staff and 3,100 were employed in the corporation's 31 regional offices, a total of 4,599 employees as of the close of the 1949 fiscal year. (HAR. H.)

Red Cross.

United States.—High lights of American Red Cross activity during 1949 included steady growth of the national blood program and record peacetime achievement in the organization's multiple services to the armed forces. The year was also marked by the appointment on Sept. 22 of Gen. George C. Marshall as president of the organization.

The Red Cross blood program, inaugurated Jan. 12, 1948, boasted more than 30 regional programs serving approximately 1,400 hospitals and 70 clinics with blood and blood derivatives at the end of 1949. About 550 Red Cross chapters in 35 states were participating in the program, which had collected approximately 400,000 pints of blood since its inception.

More than 2,000 Red Cross workers served the armed forces at 1,300 military installations and 123 military hospitals in the United States and overseas. In the 1949 fiscal year they handled 775,152 cases concerning servicemen and their families. Home service workers in Red Cross chapters handled 793,594 cases of servicemen and dependents. Financial aid to military personnel and their families from fieldworkers and chapters totalled

VENEZUELAN SCHOOL CHILDREN viewing some of the 5,000 pieces of art prepared by U.S. youngsters and sent abroad for exhibit in 1949, as part of a new American Junior Red Cross international art program

$5,406,000.

In the same period 1,315,098 cases involving veterans and their dependents occupied chapter workers and a monthly average of 96,000 claims cases were assisted by Red Cross representatives stationed at 84 Veterans' administration offices. Financial aid to veterans amounted to $3,431,000. In 113 VA hospitals, professional Red Cross staffs worked with a monthly average of 20,156 volunteers to help VA staffs in medical, recreational and welfare programs that reached an average of 135,000 patients each month.

The Red Cross assisted 228,515 persons in 330 domestic disaster operations during the 1948–49 fiscal year at a cost of $6,574,741. The Red Cross recruited 1,572 nurses to provide emergency care to disaster victims. They served 12,667 days in 72 disaster operations.

Additional nurses were recruited by the Red Cross to serve in polio-stricken areas where they supplemented local nursing resources in the worst polio epidemic in late years. During the year 126,894 home nursing certificates were issued.

Approximately 220,000 Red Cross volunteers, in nine organized services, gave 11,900,000 hours of service during the year. About 300 federal hospitals, 1,000 civilian hospitals and 1,500 other agencies received Red Cross volunteer service. Volunteers made and repaired 763,000 garments, produced 18,608,000 surgical dressings, drove 9,188,000 mi. and provided 2,443,000 individual servings of food.

Red Cross emphasis on safety continued, 38 aquatic schools attracting during the summer of 1949 about 3,500 students for qualification as instructors in water safety, first aid and accident prevention. In total: 383,557 certificates in first aid; 52,195 in accident prevention; 568,958 in swimming; and 108,410 in lifesaving were issued during the year.

Assistance to Red Cross societies and distressed peoples in foreign countries continued on a limited scale. Material aid valued at $615,306 went to 20 countries; consultants on Red Cross activity worked with 13 sister societies; and 34 Red Cross workers from 15 countries benefited from study visits, scholarships and fellowships in the United States. Approximately $135,000 worth of relief supplies were rushed to areas devastated by earthquakes in Ecuador, and three American Red Cross disaster workers were sent to advise the Ecuadorian Red Cross on emergency relief and disaster preparedness programs.

The American Junior Red Cross sent approximately $1,500,000 worth of school, health and recreational supplies to children in war-scarred countries and continued its programs for promoting international understanding and friendship. Included in supplies packed and shipped by Junior Red Cross members were 469,083 gift boxes and 215 educational chests. (H. Bm.)

World.—The outstanding event for the Red Cross world in 1949 was, strictly speaking, not a Red Cross action but the meeting in Geneva, Switz., April 21–Aug. 12, of representatives of 58 nations for the revision and drafting of what are known as the humanitarian conventions.

The three conventions revised were: Convention for the Adaptation of Naval Warfare to the Principles of the Geneva Convention (1907); Convention for the Protection of Sick and Wounded of Armies in the Field (1929); and Prisoner of War Convention (1929). A fourth, new convention—Convention for the Protection of Civilian Persons in Time of War—drafted at a meeting of representatives of national Red Cross societies in Geneva in Aug. 1946, and approved by the 17th International Red Cross conference, Stockholm, Swed., in 1948, was adopted. Formal signature of these conventions took place in Geneva on Dec. 8, 1949.

Second in importance in the Red Cross world during 1949 were relief activities undertaken by the International Red Cross at the request of the United Nations.

On Jan. 1 the League of Red Cross Societies assumed responsibility for the care of 330,000 Palestine refugees in Syria, Iraq, Lebanon, Jordan and Egypt; the International Committee of the Red Cross for 395,000 in northern and central Palestine; and the American Friends Service committee for 212,000 in southern Palestine. This program was financed at a cost of approximately $2,000,000 monthly by voluntary national contributions through the United Nations and assistance from the International Children's Emergency fund, World Health organization, International Refugee organization, Food and Agriculture organization and national Red Cross societies.

A second mandate given the International Red Cross by the U.N. general assembly in Paris, Dec. 1948, was for the repatriation of 25,000 Greek children separated from their families and living in Czechoslovakia, Hungary, Yugoslavia, Bulgaria and Rumania. Lists of the names and descriptions of approximately 6,000 of these children compiled by the Greek Red Cross were transmitted by the International Red Cross to the Red Cross societies of the above-mentioned countries for use in identifying the children, but at the end of Oct. 1949 only 138 in Czechoslovakia had been identified.

Appeals also were received by the League of Red Cross Societies from the Red Cross societies of Poland and the U.S.S.R. to assist in identifying and repatriating Polish and soviet children in the western zones of Germany and Austria.

Additional relief actions were undertaken by the League of Red Cross Societies in India and Pakistan (assistance to 600,000 refugees); Greece (706,000 refugees); Germany (11,000,000 refugees); Ecuador (earthquake); and Guatemala (floods). Assistance to the International Refugee organization in the resettlement of displaced persons continued. The work of the Scandinavian Red Cross societies with the International Children's Emergency fund and the World Health organization in combating tuberculosis among children was extended to Asia and South America.

The International Committee of the Red Cross was active as a neutral intermediary in the protection and exchange of prison-

LAST JEWISH REFUGEES to leave the British internment camp at Cyprus, shown boarding ship for Israel; they arrived at Haifa, Israel, in Feb. 1949

ers in Palestine, Kashmir and Indonesia.

Membership in the League of Red Cross Societies was increased to 68 nations by the addition of the Red Cross societies of Ethiopia and Jordan. The 21st meeting of the board of governors of the league was scheduled to be held in Monte Carlo, Monaco, in Oct. 1950. (H. W. Dg.)

Refugees. Progress in the repatriation and resettlement of the 700,000 Polish, Ukrainian, Baltic and Yugoslav refugees and displaced persons remaining in Germany, Austria and Italy as the aftermath of World War II continued during 1949. Their re-establishment in ways of living more normal than those of the displaced persons camps which had been the abode of many since 1939 was the special concern of the International Refugee organization (I.R.O.) which came into formal existence as a specialized agency of the United Nations in Aug. 1948. This organization and its predecessor agency, the preparatory commission for the I.R.O., had undertaken in July 1947 to attack the problem of more than 1,000,000 refugees and displaced persons in central Europe who had refused repatriation to their home countries of eastern Europe because of political and boundary changes in those countries resulting from the war.

Italy and Switzerland joined the organization during the year and added their efforts to those of the other members—Australia, Belgium, Canada, China, Denmark, the Dominican Republic, France, Guatemala, Iceland, Luxembourg, the Netherlands, New Zealand, Norway, the United Kingdom, the United States and Venezuela—to make possible the application of more than $150,000,000 in resources annually to the resolution of the problem. These funds were used to provide care and maintenance in camps, clothing, medical services, vocational training, a tracing service for missing persons and, most important, transportation to overseas countries of resettlement. The United States contributed more than $70,000,000 to the I.R.O. budget for the fiscal year 1949–50.

During the calendar year 1949, 318,096 were resettled or repatriated from Germany, Austria and Italy. The I.R.O. maintained a fleet of 35 ships engaged in the movement of refugees to overseas countries such as Australia, Brazil, Canada, the United States and Venezuela. The movement of Jewish refugees to Israel, which had totalled more than 143,000 since 1947, was organized by the Jewish Agency for Palestine with funds supplied by the I.R.O. By Jan. 1950 less than 40,000 Jewish refugees remained in central Europe awaiting disposition. More than 100,000 persons were transported to the United States by I.R.O. under the provisions of the U.S. Displaced Persons act of 1948, which provided for the admission of 205,000 by June 30, 1950. Approximately 85,000 were moved to Australia and 27,500 to Canada.

At the meetings of the general council of I.R.O. in July and Oct. 1949 at Geneva, Switz., plans were adopted looking toward the conclusion of operations; it was envisaged that all of those qualified for admission to receiving countries of immigration would have been resettled by the spring of 1951. Consequently it was decided to discontinue care and maintenance of refugees in the camps after June 30, 1950, and to continue thereafter the resettlement of those in process of movement by that date. These decisions left unresolved two important problems affecting refugees, namely provision for the continuing care of the nonresettleable refugees, including some 26,000 persons who would require institutional care after June 30, 1950, and the legal protection of all refugees pending their acquisition of a citizenship in a new country of residence.

The nonresettleable refugees, generally referred to as the hard core, consisted of the aged and infirm, those suffering from tuberculosis, the blind and deaf and those otherwise physically handicapped and unable to meet the rather high health requirements of immigration countries, or lacking sponsors to guarantee that they would not become public charges after admission. Some of the member governments of I.R.O. such as Belgium, New Zealand, the Netherlands, Norway and the United Kingdom were giving serious consideration at the end of the year to the acceptance of limited numbers of these permanently dependent refugees. Israel offered to receive all remaining handicapped Jewish refugees in consideration of financial assistance from I.R.O. in the construction of hospitals and other institutions for their permanent care. The I.R.O. allocated $22,000,000 in its budgets for the fiscal years 1949–50 and 1950–51 as its contribution toward the provision of continuing care for the nonresettleable group.

The continuing legal protection of refugees after the termination of I.R.O. services was considered by the Economic and Social council of the United Nations at its ninth session in July in Geneva and by the general assembly at its fourth session in New York in Nov.–Dec. 1949. Following the pattern established by the League of Nations, the general assembly decided to establish on Jan. 1, 1951, the office of high commissioner for refugees for a period of three years, with headquarters in Geneva. The Economic and Social council also established an *ad hoc* committee to convene in Jan. 1950 at Lake Success, N.Y., to revise and to consolidate in one draft convention all the existing international arrangements, agreements and conventions for refugees.

The United Nations Relief for Palestinian Refugees, created by the general assembly of the United Nations at its third session in Paris in 1948, administered relief during the year to 750,000 refugees from the conflict in Palestine and an additional 200,000 Arabs whose means of livelihood in Arab Palestine, Jordan and the Gaza area had been affected by the armistice agreements still in effect at the end of the year. Thirty-three governments had contributed a total of $32,000,000 in funds and supplies to maintain, house and clothe these refugees pending a political settlement which the Palestine Conciliation commission, also established by the United Nations, was endeavouring to achieve. The direct administration of relief under the auspices of the U.N.R.P.R. was conducted by the International Committee of the Red Cross, the League of Red Cross Societies and the American Friends Service committee, assisted by many other voluntary agencies.

As the political settlement was delayed and the repatriation of the refugees to their former homes in Israel and Israeli-held areas appeared unlikely to take place, the Palestine Conciliation commission organized the Economic Survey mission for the Middle East, which recommended to the U.N. General Assembly the creation of a new agency to undertake a works program for the refugees to supplant the relief program by Dec. 30, 1950.

The general assembly voted on Dec. 8, 1949, to establish the United Nations Relief and Works Agency for Palestine Refugees to take over the relief activities of the United Nations Relief for Palestinian Refugees, scheduled to discontinue operations by April 1950. A budget of $54,900,000 for 18 months was adopted, including $33,700,000 for relief and works projects during 1950 and $21,200,000 for works projects for the period Jan. 1–June 30, 1951. This action of the general assembly recognized that continued assistance to Palestine refugees was necessary to prevent starvation and distress and to further peace and stability in the area, and that constructive measures looking toward the rehabilitation of the refugees would have to be undertaken to replace the administration of direct relief. The resolution provided that the director of the agency was to be appointed by the secretary-general of the United Nations in consultation with the members of an advisory commission consisting of representatives of France, Turkey, the United Kingdom and the United States, and that he was to be responsible directly to the general assembly.

Only limited progress was made during 1949 in the integration into the economy of the three western German zones of the 8,000,000 German refugees formerly members of the minorities of Poland, Czechoslovakia and Hungary. Many of these had been expelled in 1945 and 1946 under the terms of the Potsdam agreement, which gave formal recognition to a mass exodus resulting inevitably from the former German occupation and administration of these countries. Their numbers were increased during the year by a steady flow of infiltrees from the eastern zone of Germany and from that part of Germany administered by Poland. Their presence greatly intensified the social, economic and political problems of postwar adjustment confronting the German Federal Republic.

Efforts to amend the Displaced Persons act of 1948 persisted in the U.S. congress. Amendments increasing the numbers to be admitted to 339,000, eliminating the preferences for farmers and for persons from *de facto* annexed areas and moving the eligibility date forward from Dec. 22, 1945, to Jan. 1, 1949, passed the house of representatives, but remained under consideration by the senate.

Relief.

The pattern of assistance in the British Commonwealth of Nations was beginning in 1949 to assume a uniformity among its constituents. The one exception was the Union of South Africa, where all nonwhite people had been excluded from the benefits of social legislation as a phase of their general disfranchisement.

Canada, Great Britain, Australia and New Zealand during the year liberalized their provisions for assistance either to meet the increased cost of living or to broaden the basis of eligibility. Australia made the most marked increase in all phases of its public assistance program to meet the increased cost of living, with Canada undertaking a more piecemeal program. Great Britain's improvement was largely in the way of more efficient and liberal administration.

Following the lead by New Zealand in establishing in 1942 an inclusive scheme to cover all possible occurrences of need, both Australia and Great Britain brought their varied provisions for assistance into relationship with each other, filling the gaps between them and so approximating the unitary program of New Zealand. The year 1949 was the first full year in which their revisions were operative. The Canadian parliament discussed the possibility of integrating its various dominion and provincial provisions into a single plan, which would "cover all citizens in every circumstance where an individual or family was for any reason deprived of the opportunity of earning a living." The difficulty of achieving such a goal in Canada was probably contitutional as well as administrative, but the same barrier stood n the way of a national plan for Australia and was met by contitutional revision.

In the area of international comity, New Zealand had also led he way in 1942 by arranging with Australia for granting the benefits of old-age and invalidity assistance to citizens of one country living in the other. During 1949 the two countries exended their reciprocal services to include beneficiaries of widows' allowances, child endowment, unemployment assistance and ickness. Great Britain entered into a similar arrangement with France, covering sickness, maternity, industrial accident and death, and was negotiating with Belgium, Luxembourg and the Netherlands to establish a similar pattern of comity with them. During the year the parliaments of New Zealand, Australia and Canada discussed the possibility of a comprehensive plan of nterchange of benefits between all the dominions of the British Commonwealth of Nations, so that a citizen of any one of the nations would be eligible, wherever he might be residing.

In the United States there was a stalemate on all expansions of social security in 1949, except a liberalizing of old-age and urvivors insurance to cover rural workers and the self-employed. But because of the conservative nature of old-age nsurance in the United States, which does not attempt to compensate those who are older than the average at time of its nception, the benefits of its provisions do not reach even mininum adequacy much before 35 or 40 yr. after its start. For nstance, the old-age insurance program entered its 15th yr. of operation during 1949. There were slightly more than 1,500,000 persons drawing its benefits; but the average amount received by each beneficiary was less than $35 a month. Consequently, old-age assistance, which theoretically should merely fill in the gaps not protected by insurance, went to more than 2,600,000 persons with an average payment of slightly less than $44 a month. That is, in half a generation after its passage, the need of the aged was carried primarily by the assistance provision with its means test and supervision, not by insurance to which he beneficiary has a vested right.

Bills were introduced into the congress to cover the needs of hose not protected by the provisions of the Social Security act —the unemployed, the sick and the handicapped dependent; but they did not reach the voting stage by the end of the year.

The results of Community fund solicitations in the United States indicated that in 1949, 193 chests raised $76,632,105; his represented a 2.7% increase over 1948. (*See* also Child Welfare; Community Chest; Red Cross; Social Security.)

(F. J. B.)

Religion. Religion in 1949 was deeply involved in the secular conflicts and unrest of the times. In international atherings of the same church families, rather mild divergencies developed between representatives of Great Britain and the U.S. over political ideologies. Nationalist ferment was a disurbing force in the religious situation throughout the entire ast. Indigenous religions were quickened and made militant by the new independence of their peoples. In areas of political disorder, Christian institutions were seized and restrictions put upon property and funds of mission enterprises. Indian naionals viewed their previous church relationships from a new perspective and were sometimes inclined to blame the squabbles of western sects for their own divided condition.

Definite threats to religious liberty appeared in Mohammedan ands such as Iran and Egypt. Chinese Christianity, caught in he flood of the Communist advance, was tried by fire. On wide fronts between east and west a bitter struggle went on between the churches and the Communist governments. In general the Roman Catholic Church bore the major brunt of the attack; while expressing sympathy for the Roman Catholic plight, the World Council of Churches pointed out Catholic infringements on Protestant liberties in Spain and Latin America.

SCENE from the Wichita Mountain Easter Sunrise pageant, an annual event attended by thousands near Lawton, Okla. The pageant was performed in April 1949, with a cast of some 3,000 persons

The theoretical position of all major branches of Christendom was the same, namely that the basic human rights derived from God are above the authority of the state, and that the natural moral law is supreme to legal enactments.

Interpretations of religious liberty, however, under this principle continued to differ greatly. The Federal Council of Churches of Christ in America proposed top-level conferences between Roman Catholic and Protestant authorities in the face of common danger to try to reach an understanding on this point. The United Nations assembly passed a resolution expressing concern for denials of religious liberty throughout the world.

War and Peace Among the Churches.—The Hebrew, Christian and Mohammedan faiths were involved in the issue of the internationalization of Jerusalem as the site of religious shrines. The Roman Catholic Church pressed for this, and many Protestants thought it appropriate.

Catholic-Protestant relations in the United States reached a new peak of bitterness in the controversy over public aid to sectarian education, personalized in interchanges between Mrs. Franklin D. Roosevelt and Francis Cardinal Spellman. The Federal Council of Churches proposed as a solution that public support should go to nonsectarian schools only, but that health and welfare projects for children should be considered as a separate matter, without regard to enrolment in public or religious schools.

The great middle section of Protestant churches in the United States, united in the Federal council and numerous national and local organizations, was violently opposed by the fundamentalist American Council of Christian Churches. At a conference in Ceylon of the younger churches of Asia designed to define their relations with the World council, this agency sent emissaries to denounce the council. It also sent representatives to a delegated conference on Christian unity, called by eight denominations at Greenwich, Conn., in December.

Peace between the churches made progress in spite of conflict. There were steady evidences of assimilation, marked for example by the fact that sects previously regarded as irregular were winning acceptance in cooperative work, usually first at local levels. Divergent theologies which had battled through the centuries began to reach agreements through a "Bible-centred" approach. Scholars of the World Council of Churches whose theoretical positions seemed abhorrent to each other found that they could agree on the meaning of specific passages of Scripture as the Word of God concerning human life. (See CHRISTIAN UNITY.)

Religious Organization and Activity.—As an organization the Christian Church in the United States showed continued strength and vitality. Of the population, 53% was enrolled in formal membership, and if all denominations counted their baptized infants, as many of them do, the figure would approximate 59%. For the first time, the financial income of 52 major non-Roman churches was beyond the billion dollar mark, and the per-member rate of giving steadily increased.

Evangelism was aggressively pressed. The Church of England conducted an intensive campaign in London, with a force of 15,000 missioners using 55,000 billboard announcements, loud-speakers and all modern instruments of publicity. The Federal Council of Churches launched a united evangelistic campaign, supplementing that of the major denominations, to continue through 1950.

There was increasing adoption of the technical instruments of public appeal. Public relations and varied publicity were stressed. The Methodist Church in the United States circulated 5,500,000 pamphlets on the fundamentals of the faith. Extensive experiments in the use of television were launched and the Protestant Radio commission greatly extended its work.

Religion and the Secular Climate.—The tone of secular thinking had been obviously modified; its mood was more congenial to religion. The decision of the United Nations to open its sessions with a period of silence and meditation was one symptom. The advertising clubs of the U.S. actively backed a Religion in American Life campaign during the fall of 1949, under the leadership of Charles E. Wilson, president of the General Electric company. The appreciation of religion by social conservatives fearful of revolution might not reveal the purest of motives; but a growing sincerity and wistful concern for the need of the world was widely prevalent. Religious Education.

Protestant.—In July 1949 the first Curriculum Conference for Protestant Churches in the Spanish-speaking countries of Latin America was held in Buenos Aires, Argentina, with 14 countries represented. The World Council of Christian Education shared in sponsorship of the conference, which was interdenominational as well as international in character. Basic plans were made for the preparation of new and better curriculum materials for Sunday schools and other institutions of Christian education than had heretofore been available.

The World Christian Youth commission met in Switzerland in July, composed of representatives of the World Alliance of Young Men's Christian associations, the World's Young Women's Christian association, the World's Student Christian federation, the World Council of Churches and the World Council of Christian Education. Two major proposals were adopted: (1) to hold an enlarged meeting in Asia in 1952 and (2) to place particular emphasis upon finding ways of winning young people in industry, especially in Asia where industrial development was relatively new.

At its annual meeting early in 1949, the International Council of Religious Education adopted a statement prepared under the chairmanship of Luther A. Weigle of Yale university divinity school, expressing the belief that religion and education are inseparably related and that any attempt to separate them does violence to both.

In August the board of managers of the World Council of Christian Education met in London. Considerable attention was given to the plans for the World Convention on Christian Education and the World Institute on Christian Education scheduled to be held in Toronto, Canada, in the middle of 1950.

Orthodox.—A thoughtful interpretation of religious education in the Orthodox Church appeared in *World Christian Education* (published by the World Council of Christian Education), first quarter, 1949, under the authorship of Sophie Koulomzine, a member of the Russian Orthodox Church. She pointed out that despite the lack of a conscious, organized effort on the part of the Orthodox Church to provide religious education, the church continued its strong hold on children as was evidenced in the U.S.S.R. On the other hand, children and young people in the Orthodox Church who had no normal Christian homes, who could not attend church services and did not take part in the life of the church were likely to be lost. It was this fact which led some of the officials of the Orthodox churches to become concerned about the needs for religious education imposed by contemporary conditions.

In Jan. 1949 a small meeting of young people from Orthodox churches was held in Switzerland under the sponsorship of the youth department of the World Council of Churches. This meeting resulted from the fact that there were Orthodox representatives in the World Council of Churches itself and also in the youth department committee who were interested in strengthening youth work in the Orthodox churches. (F. L. KP.)

Roman Catholic.—The Catholic school system, with five classes of institutions (parochial or elementary, secondary, normal, seminary and university) continued to expand in 1949. There was an increase of 153,392 pupils in 7,777 elementary parish schools to a total of 2,351,604, and an increase of 7,018 in students attending 541 private elementary schools, bringing that total to 83,646. Parish and diocesan high schools reported enrolments of 319,599 in 1,596 schools, and 798 private high schools were teaching 189,125 students. Students in seminaries and novitiates reached a record total of 26,215, an increase of 2,514 over the previous year. There were 64 diocesan seminaries, 337 religious-order seminaries, or novitiates and scholasticates Colleges and universities for men and women numbered 228, with 240,048 students.

During the summer of 1949 a six-week institute for educators of the deaf was conducted at the Catholic University of America, Washington, D.C. The second season of the Catholic-sponsored adult education program, presenting studies in theology, philosophy, art and the social sciences, was opened in Washington on Oct. 10. The education department of the National Catholic Welfare conference continued its work of collecting and furnishing to school officials and the general public data concerning Catholic education. A survey of secondary education was published by the department in 1949.

In April a new catechism setting forth the teachings of the Roman Catholic Church was issued for the use of high school nd college students, Newman clubs and other adult study units. Though the church's doctrine remained the same, new points vere emphasized because the ways of living had brought out ew problems. The new catechism clearly stated that a tele-ised service did not fulfil the obligation of attending Sunday Mass. Euthanasia was condemned. For the first time in the Baltimore series, the Catholic stand against cremation was ex-licitly set forth. (J. LaF.)

Jewish.—Jewish education in European lands, despite im-rovements since World War II, was prevented from making reater strides because of the dearth of up-to-date textbooks and ther pedagogic devices. In the study of conversational Hebrew nd current Hebrew literature some aids were obtained from Palestine. The transmission of knowledge of Jewish history and eligion, however, was not very much advanced from the stand-rds which prevailed in the old cheder. The backwardness was lue to the absence of means, which accounted for poor pay for eachers and the resignation to low professional standards and dministrative procedures. The dearth of dollars made difficult he purchase of textbooks and equipment developed in the United States and adaptable to European schools.

In the State of Israel Jewish education was intensive and dvanced in both the traditional and the modern schools. Norms nd standards for the knowledge of Hebrew language and litera-ure were set up and were being utilized by Jews in other lands.

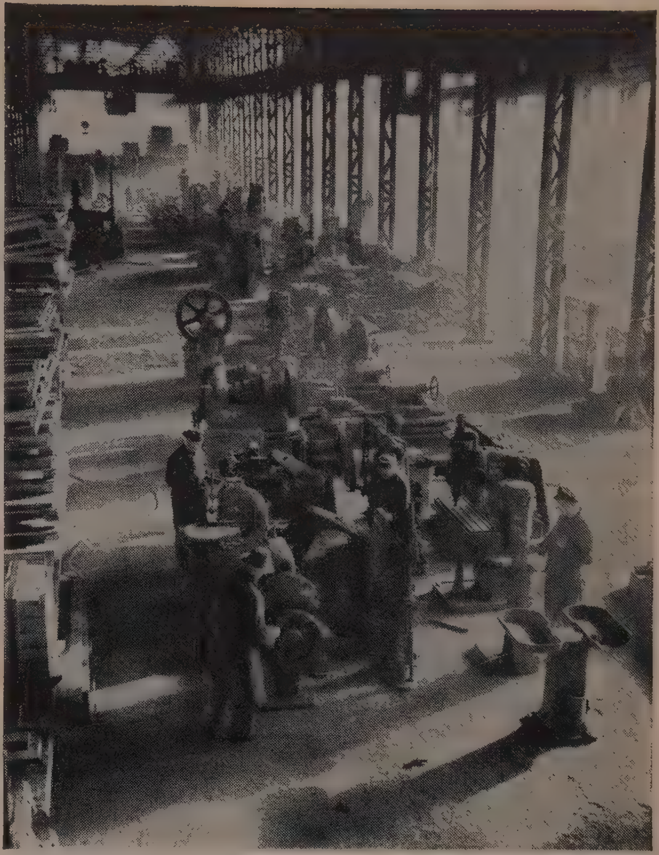
In the United States the most notable development was the nultiplication of all-day Jewish schools. The increased use of ummer camps for educational as well as recreational purposes nd the provision of improved facilities to enable children in ural districts to come to a central point where they could ob-ain a better Jewish education were also items of achievement luring 1949. (B. H.)

Reparations.

Germany.—Important agreements made during 1949 by the United States, France and he United Kingdom substantially lowered the level of future eparations removals from western Germany and made possible n early termination of the program.

The Economic Cooperation administration announced in Jan-ary that Administrator Paul Hoffman had accepted the recom-nendations made by an industrial advisory committee headed y George M. Humphrey urging the retention in Germany of ertain equipment in 167 of the 381 plants which it had sur-eyed. In February Lewis Douglas, U.S. ambassador in London, England, initiated formal discussion of the recommendations vith British and French officials in conjunction with a report rom the military governors of the three western zones on a evised list of prohibitions and restrictions which should be ap-lied to German industry on security grounds. In the course of hose negotiations, five steel plants, three chemical plants and ertain equipment in another steel plant were removed from the ist of projected exemptions at the insistence of the British and French governments, thus reducing the number of exempted lants from 167 to 159.

Formal announcement of the agreement reached was made n Washington, D.C., London and Paris, France, on April 13. The state department pointed out that the revision had been nade in order to bring the dismantling program into harmony vith the European Recovery program. Most of the 159 plants vere located in the British zone, and the amount of equipment vhich had been scheduled for removal from them varied from single piece of equipment to the entire equipment of an op-rating factory. The affected plants included 32 plants in the teel industry (only 5 of which produced raw steel), 88 metal working plants, 32 chemical plants and 7 nonferrous metal plants. It was estimated that the exemptions would reduce by 10% the total value of all plants, including war plants, scheduled to be removed as reparations.



DISMANTLED MACHINE TOOLS at the Krupp plant in Essen, Ger., being readied for shipment to Yugoslavia as reparations in Feb. 1949

The policy of taking reparations from Germany continued to be attacked, both in Germany and elsewhere, including the U.S. congress. German protests ranged from press propaganda to strikes by workers and official opposition. Soon after the inauguration of the Federal Republic of Germany, the chancellor, Konrad Adenauer, began pressing Allied representatives for further concessions. At their meeting in Paris on Nov. 9 and 10, Dean G. Acheson and Ernest Bevin and Robert Schuman agreed to authorize their respective high commissioners in Germany to discuss the subject of dismantling with Adenauer with a view to final settlement of the problem. The agreement reached as a result of these discussions was initialed at Bonn, Germany, on Nov. 22 and provided for the removal from the reparations list of 11 synthetic oil and rubber plants, 7 steel plants and the cessation of all dismantling in western Berlin and, with certain exceptions, at the I. G. Farben plant at Ludwigshafen-Oppau.

It was reported in September that the U.S., France and the United Kingdom had agreed not to make any further deliveries of industrial plant to the U.S.S.R. as reparations, and on Dec. 3 the 19 members of the Inter-Allied Reparation agency were reported to have decided to divide among themselves the German industrial equipment stored in western Germany which had originally been destined for the U.S.S.R. under the Potsdam agreement.

Austria.—At its meeting in Paris from May 23 to June 20, the Council of Foreign Ministers agreed that reparations should not be exacted from Austria, thereby rejecting Yugoslavia's claims. It was stipulated, however, that the U.S.S.R. should receive from Austria the sum of $150,000,000 over a period of six years, with the additional proviso that, although there should be relinquished to Austria all property, rights and interests claimed as German assets or war booty, the U.S.S.R. should receive outright all the assets of the Danube Shipping company in Bulgaria, Hungary, Rumania and eastern Austria as well as the possession of 60% of Austria's oil properties for a period of 30 yr.

By the end of 1949 the deputies of the foreign ministers had not made any progress in agreeing upon the incorporation in a draft treaty of the principles thus enunciated.

Japan.—On May 12 the Far Eastern commission was advised by Maj. Gen. Frank R. McCoy of the decision of the U.S. government to terminate the Advance Transfer program, to take no further unilateral action to make possible additional reparations removals from Japan and to submit to the commission new policy proposals which would have the effect, if adopted, of precluding further industrial reparations removals from Japan during the occupation. General McCoy's statement emphasized that (1) the burden of further reparations removals from Japan could detract seriously from the occupation objective of stabilizing the Japanese economy and permitting it to move toward self-support; (2) the failure of the commission to agree upon a reparations-shares schedule made it impossible to implement existing commission decisions regarding reparations; and (3) Japan had already paid substantial reparations through expropriation of its former overseas assets and, in smaller degree, under the Advance Transfer program.

The U.S. decision was translated into a U.S. joint chiefs of staff directive for implementation by Gen. Douglas MacArthur. It provided that "items already processed" under the Advance Transfer program "will be made available for removal" and was interpreted to include reparations already packaged and in the process of being packaged as well as items allocated but not yet packaged.

Actual deliveries under the Advance Transfer program from the date of its initiation to Nov. 30 were as follows (in thousands of yen, 1939 values):

Claimant	Segment 1*	Segment 2*	Segment 3	Total
China	51,492	682	6,254	58,428
Netherlands.	11,557	226	4,051	15,834
Philippines	18,527	218	2,242	20,987
United Kingdom	9,723	197	9,715	19,635
Total.	91,299	1,323	22,262	114,884

*Deliveries completed and account closed.

Total allocations from segment 3, the only segment from which deliveries were still to be made at the end of the year, were 63,256.641 yen (including deliveries already made as indicated in the table above). Allocations by country were as follows: China, 27,848,082 yen; Netherlands, 6,992,816 yen; Philippines, 13,222,869 yen; United Kingdom, 15,192,874 yen. Packaging was virtually completed by Dec. 15.

BIBLIOGRAPHY.—Inter-Allied Reparation Agency, Report of the Secretary General for 1948 (Brussels, 1949); Far Eastern Commission, Second Report of the Secretary General, July 10, 1947-Dec. 23, 1948 (1949). (J. W. Mw.)

Representatives, House of: *see* CONGRESS, UNITED STATES; ELECTIONS.

Republican Party. In 1949 the Republican party, out of power at Washington, D.C., for 16 years, became a divided and weakened organization in search of a popular leader and a popular issue.

Intraparty bickering began as soon as the national committee held its annual meeting at Omaha, Neb., in January. Committeemen identified with the Taft-Stassen forces demanded the resignation of National Chairman Hugh D. Scott, Jr., of Pennsylvania, who had been selected for the post by Gov. Thomas E. Dewey of New York after his nomination as the 1948 presidential candidate. The opposition argued that Dewey and Scott had been too sympathetic to President Truman's "fair deal" program in the 1948 contest, and that they no longer represented or reflected major party sentiment.

"CONFUSED TRAVELER," a cartoon by Justus printed in the *Minneapolis Star* in 1949

When Scott refused to quit while under fire, National Committeeman Jacob France of Maryland offered a resolution proposing that the national chairmanship be declared vacant in the "best interests" of the party, and that a new chairman be chosen. The motion was tabled by a 54–50 vote. Principal speaker in favour of the motion was Rep. Clarence J. Brown of Ohio, who had been Sen. Robert A. Taft's preconvention manager in 1948.

Scott submitted his resignation at a special meeting of the national committee at Washington in August. After a sharp skirmish between eastern and western factions, National Committeeman Guy George Gabrielson of New Jersey was elected over National Committeeman Axel J. Beck of South Dakota by a 52–48 vote, with 2 ballots for A. T. Howard of Nebraska.

Gabrielson, a Manhattan lawyer, had been a Dewey supporter at the 1948 convention, but he immediately disassociated himself from any candidate or faction. He also placated the anti-Dewey group by declaring that he did not believe in a "me, too" policy.

Another important resignation served to illustrate the intraparty differences. James S. Kemper, Chicago insurance executive, quit as party treasurer because he disagreed with prominent Republican congressmen's support of the administration's foreign policy. He opposed especially loans and grants to the British labour government, which he described as "the younger sister of Russian Communism." Declaring that many important contributors were refusing to give money to the party because of its "me, too" attitude, as reflected in the Dewey and Wendell L. Willkie campaigns and Republicans' congressional voting, Kemper revealed that there was only $90,000 in the special reserve fund. On Dec. 31, 1949, the deficit in the everyday, operating treasury, as distinct from the reserve, was $420,000.

Kemper was succeeded by R. Douglas Stuart, Chicago food nanufacturer.

Contributions picked up in the year's last month. The inrease was attributed to the tentative decision of influential ational committee members and G.O.P. legislators to scrap the me, too" policy, except possibly in foreign affairs, and to the nnouncement of Governor Dewey that he would not be a andidate for the 1952 presidential nomination.

In November, acting on an authorization from the August neeting of the national committee, Chairman Gabrielson ounded the sentiment of Republican officeholders and organiation members on issuing a formal statement of principles. Ie asked: "Should there be a restatement of party principles at his time? If so, what should the restatement contain?"

Election results in 1949 had an anti-Republican flavor. The ontest which attracted most attention was the senatorial race n New York, where former Gov. Herbert H. Lehman opposed ohn Foster Dulles, who had been appointed by Governor Dewey to the seat made vacant by the resignation of Robert F. Wagner. Dulles made an all-out campaign against "statism," is description of the Truman "fair deal" philosophy. President Truman threw all his influence behind Lehman, who won by a lurality of 196,293 in a total vote of more than 5,000,000.

The Democrats also won mayoralty contests in such key ities as Boston, Mass., New York, Pittsburgh, Pa., Cleveland, O., and Louisville, Ky. In New York city the Republicans lected only 1 man to the new 25-man city council. In Philalelphia, Pa., the Democrats won four municipal offices which hey had never held in modern political history.

There were five special congressional elections to fill vacanies in 1949—three in New York, one in Pennsylvania and one n California. The Democrats won all except that in Pennsylania, where the G.O.P. picked up a seat. But that gain was ffset by a loss in California, where a Democrat won the place ormerly held by a pro-"fair deal" Republican.

The Republicans' only major victory was the re-election of Gov. Alfred E. Driscoll of New Jersey, who defeated former Rep. Elmer H. Wene by 80,070. Driscoll might have lost if it ad not been for a factional revolt against Frank Hague, veteran Democratic leader of Hudson county. Whereas Hudson ad usually given a plurality ranging from 70,000 to 100,000 o a Democratic candidate, Wene carried it by only 1,550.

So discouraging were the 1949 election results that Sen. John W. Bricker of Ohio, the party's vice-presidential nominee in 944, urged that the Republicans and conservative Southern Democrats, who frequently join in voting against administraion proposals, formalize their legislative alliance by merging nto a new political party. His suggestion was received coldly y the proposed participants in the coalition.

As the year closed, the Republicans were discussing possible residential nominees for 1952. Despite disclaimers that he ntertained any political ambitions, Gen. Dwight D. Eisenower's speeches attacking the "welfare-state" philosophy led to requent mention of him in the press. Senator Taft of Ohio ontinued to figure in all speculation. So did Harold E. Stassen, ormer governor of Minnesota and president of the University f Pennsylvania, Philadelphia, and Gov. Earl Warren of Caliornia, the 1948 vice-presidential nominee.

Reuther, Walter Philip (1907–), U.S. labour leader, was born Sept. 1 in Wheeling, W.Va. He worked in steel and auto plants, and in 1933, with his brother Victor, embarked on a tour of 11 countries of Europe and Asia, working in factories and studying labour movements. In 1936 he was elected to the international executive board of the United Automobile Workers, which was affiliated with the Congress of Industrial Organizations. In 1942 he became vice-president of the U.A.W. and in 1946 president. On April 20, 1948, unidentified assailants seriously wounded him with a shotgun blast; 13 months later, his brother was similarly attacked.

In Jan. 1949, he announced a fourth round of postwar wage demands, this time concentrating on securing pension concessions from the automobile manufacturers. He signed an agreement incorporating pension details with the Ford Motor company in September, and announced that the Chrysler Motor company would be the next to receive pension demands. On Dec. 20, 1949, an attempt to blow up the U.A.W. headquarters with dynamite failed because the fuses were improperly taped, and Reuther said this was a new incident in a "campaign of terror . . . waged by anti-labour, un-American elements."

Rheumatism: *see* ARTHRITIS.

Rhode Island. A north Atlantic state of the United States, in New England; one of the 13 original states; popularly known as "Little Rhody." Area, 1,214 sq.mi. (smallest of the United States), including 156 sq.mi. of water; pop. (1940) 713,346. The urban population was 653,383 (91.6%). On July 1, 1949, the bureau of the census estimated the population of the state at 743,000. Capital, Providence (253,504).

Other cities include Pawtucket (75,797); Woonsocket (49,303); Cranston (47,085); Newport (30,532); Warwick (28,757); Central Falls (25,248).

History.—At the regular 1949 session of the legislature, leading measures passed included the following: a general appropriations act for support of the government for the fiscal year ending June 30, 1950, to the amount of $36,908,641.18; an act making an appropriation of $1,000,000 for construction of highways under the federal Hayden-Cartwright act; an act requiring public utilities to file schedules showing rates and charges with the public utility administrator; an act requiring a fire alarm box to be installed in every theatre and a fireman to be stationed there; an act giving approval to a compact with other New England states for creation of a New England development authority; an act authorizing the governor to enter into reciprocal agreements with other states in matters affecting the interstate movement of transportation by motor vehicle and creating a reciprocity board and defining its duties; an act cited as the uniform divorce recognition act, concerning the recognition of a divorce obtained in another jurisdiction; an act making desertion by husband or father going into another state an extraditable offense; an act to prohibit discriminatory employment practices and policies based upon race or colour, religion or country of ancestral origin and to create a commission for fair employment practices, and defining its functions, powers and duties; an act increasing cash sickness payments from a maximum of $18 weekly to $25 weekly and the maximum duration of benefit periods from 20 to 26 weeks; second passage of the following proposed constitutional amendments: permanent registration of voters; raising legislator's pay from $300 to $1,500 annually with extra pay for leaders; permitting the state to borrow in excess of $50,000 on short term tax anticipation notes and enabling veterans to vote in financial town meetings even if their $1,000 property tax exemption leaves them with no tax to pay; first passage of the following constitutional amendments: abolishment of the poll tax; life tenure for supreme and superior court judges with retirement mandatory at age 70; extension of the period of registration for voting from June 30 to Sept. 30.

The chief executive officers of the state elected in Nov. 1948 for 1949–50 were John O. Pastore, governor; John S. McKiernan, lieutenant governor; Armand H. Cote, secretary of state; William E. Powers, attorney general; Raymond H. Hawksley, general treasurer. Edmund W. Flynn was chief justice of the supreme court.

Education.—During 1948–49 there were in the public elementary schools 60,678 pupils and 2,063 teachers; in junior high schools 16,039 pupils and 835 teachers; in senior high schools (three years) 13,243 pupils and 702 teachers; in senior high schools (four years and vocational) 4,590 pupils and 230 teachers. Pupils attending private schools were: elementary 26,209; junior high 4,220; senior high (three years) 1,017; senior high (four years) 5,932. Total number of teachers in private day schools was 1,187. Current expenditures for day schools were $18,452,751.88 and for evening schools $43,703.14. The director of education in 1949 was Michael F. Walsh.

Social Insurance and Assistance, Public Welfare and Related Programs.—The total number of persons receiving public assistance in all categories (excluding incapacitated fathers) in Nov. 1949 was 39,174. The total amounts paid out during the year Dec. 1, 1948, to Nov. 30, 1949, were as follows: general public assistance $3,564,310; soldiers' welfare $257,807; old-age assistance $5,181,689; aid to dependent children $3,306,693; aid to the blind $94,657. In unemployment compensation, the net amount of benefit payments during 1949 was $31,379,129.50 to 133,290 different individuals. The amount paid into the fund during 1949 including interest was $9,136,055.05. There were 738 inmates in corrective institutions on Nov. 30, 1949, and 5,136 patients in charitable institutions and institutions for defectives, the number in the latter being 4,017.

Communications.—The total mileage for highways on Dec. 31, 1949 (excluding city roads and streets under the control of the seven cities) was 2,622 mi. of which total 836 mi. were state roads built and maintained by the state into and through the cities. At the close of the year 1948, railroads were operating 184.79 mi. of main track in the state. On Dec. 31, 1949, motorbuses operated on 200.92 mi. of road, and trackless trolleys 82.37 mi. of road in the state. Water-borne commerce of the state for 1948 was 8,021,410 tons of which 875,436 tons were foreign commerce (imports 872,150 tons; exports 3,286 tons) and 6,871,388 tons were coastwise (receipts 6,176,825 tons; shipments 694,563 tons) and 274,586 tons were internal (receipts 111,995 tons; shipments 162,591 tons). On Dec. 31, 1949, there were two public-owned (state) airports, both class three, and seven private-owned airports or landing fields, all class one. Also there were two naval airports owned by the United States. In Dec. 1949, there were 227,905 telephones in service.

Banking and Finance.—There were 30 banking institutions in 1949. Resources of 22 banks under state supervision totalled $845,768,832.55, and of 8 banks under federal supervision $236,291,571.29. Savings deposits (exclusive of club accounts) in savings banks and trust companies (the 22 state banks) amounted to $544,203,730 on June 30, 1949. In addition, 6 loan and investment companies had resources of $4,630,724.71; 8 building and loan associations $83,194,876; 34 credit unions $15,010,102.32.

At the close of the fiscal year, June 30, 1949, total state receipts were $45,626,365.22; expenditures and encumbrances $43,201,046.94; surplus from operation $865,756.34. The state gross debt was $42,857,000, net debt $38,149,932.16.

Agriculture.—The total acreage of principal crops harvested was 51,000 in 1949. Cash income from crops in 1948 was $7,006,000; from livestock and livestock products $17,399,000; from government payments $92,000; total gross farm income $24,497,000. The value of livestock Jan. 1, 1949, was $8,177,000.

Table I.—*Leading Agricultural Products of Rhode Island*

Crop	1949	1948	Average, 1938-47
Corn, all, bu.	266,000	259,000	325,000
Hay (tame), tons	50,000	53,000	49,000
Alfalfa, tons	2,000	2,000	2,000
Potatoes, bu.	1,160,000	1,462,000	1,148,000
Oats, bu.	30,000	33,000	31,000
Apples (commercial), bu.	279,000	143,000	218,000
Peaches, bu.	15,000	14,000	15,000

On Jan. 1, 1949, the livestock population of the state included: 1,000 horses and colts; 22,000 milk cows two years old and older; 6,000 other cattle; 10,000 hogs; 2,000 sheep and lambs; 549,000 chickens; 5,000 turkeys; and 1,000 colonies of bees. Livestock products marketed in 1948 included: 132,000,000 lb. of milk valued at $8,671,000; 797,000 chickens, $2,097,000; 31,000 turkeys, $350,000; 7,250,000 doz. eggs, $4,502,000; and 21,000 lb. of honey, $5,000.

Manufacturing.—Employment in Dec. 1949 totalled 116,279 production wage earners and 18,860 nonproduction workers (salaried personnel) and the weekly pay roll was $5,845,742 for all manufacturing industries in Rhode Island according to the state department of labour. Wage earners were distributed among manufacturing industries as follows: textiles 61,128 (cotton 15,388; rayon-silk 5,162; woollen-worsted 26,003; finishing 10,845; miscellaneous textiles 3,730); jewellery-silverware 18,402; metals and machinery 25,490 (primary 5,163; fabricated 6,246; machinery 8,278; electrical machinery 5,803); rubber products 6,569; miscellaneous 16,414. The number of establishments employing five or more workers was 3,744 in Oct. 1949, and the number of persons employed was 200,731.

Mineral Production.—The value of mineral production in Rhode Island is small, exceeding only that of Delaware and the District of Columbia. Principal products in order of value are stone, sand and gravel and graphite. Value in 1947 was $785,000, in 1946 $561,000, in 1945 $508,000 and in 1944 $612,000. The values of products were stone $274,130 in 1946, $219,263 in 1945, $213,351 in 1944, and sand and gravel $8,486 in 1946, $221,530 in 1945, and $287,112 in 1944. Quantity production of stone was 4,860 tons in 1946, 11,280 tons in 1945 and 19,790 tons in 1944; sand and gravel 41,659 tons in 1946, 317,300 tons in 1945 and 352,905 tons in 1944. (M. C. Ml.)

Rhodesia, Northern.

Northern Rhodesia is a British protectorate on the plateau of central Africa. Area: 290,320 sq.mi. Pop. (1948 est.): 1,720,000. Chief towns: Lusaka (cap.), Livingstone and Ndola. Governor in 1949: Sir Gilbert McCall Rennie.

History.—In Feb. 1949 unofficial European members of both the Northern Rhodesian and Nyasaland legislative councils took part in a conference, attended also by the prime minister and other members of the Southern Rhodesian government, at which a unanimous resolution was passed in favour of federation of the three territories and the creation of a federal parliament, the federal government to have wide powers.

Unofficial members of the legislative council having raised the question of taxing the mineral royalties of the British South Africa company, a meeting was called in London between the secretary of state for the colonies, the governor, and representatives of the elected members of the legislative council and of the company; it was there agreed, *inter alia,* that, subject to certain guarantees in the meantime, the company should transfer its mineral rights to the government of Northern Rhodesia after 37 years.

A speech, made by the secretary of state for the colonies at Salisbury, Southern Rhodesia, during a tour of central Africa in the spring, was strongly criticized by the European element in Northern Rhodesia. In the course of the speech the secretary of state stressed the British government's responsibilities to the Africans in Northern Rhodesia and defined the scope of white settlement and European development. Later he found it necessary to enlarge on his statement and define his meaning more explicitly.

Under the auspices of the Beit trustees one of London's emergency wartime bridges was transported and re-erected over the Kafue river, thus linking more effectively two sections of the Great North road in southern Africa. (*See* also RHODESIA, SOUTHERN.)

Finance and Trade.—Currency: Southern Rhodesian pound at par with sterling. Budget (1948): revenue £6,715,517; expenditure £6,208,455. Foreign trade (1948): imports £16,438,126; exports £28,650,783. Principal exports: copper (blister and electrolytic), zinc and lead.

(Jo. A. Hn.)

Rhodesia, Southern.

A self-governing African colony in the Commonwealth of Nations, with imperial government supervision over native rights. Area: 150,333 sq.mi. Pop. (Aug. 31, 1949, est.): 2,021,900 (European 115,500; African 1,898,000; Asiatic 3,400; mixed 5,000). Chief towns (1949 est., Europeans only): Salisbury (cap., 32,000); Bulawayo (28,000); Umtali (4,200); Gwelo (4,000). Languages: English, Afrikaans and native tribal languages. Governor in 1949: Major General Sir John Noble Kennedy; prime minister: Sir Godfrey Huggins.

History.—Politically, 1949 was an uneventful year. The United party lost the only by-election held in 1949, being defeated by the Southern Rhodesia Labour party candidate in Bulawayo district. The prime minister headed a delegation to a meeting with nonofficial representatives of Northern Rhodesia and Nyasaland at Victoria Falls under the chairmanship of Sir Miles Thomas to discuss federation of the three territories. A resolution in favour of "a constitution which will create a federated parliament with such powers as are surrendered to it and which will not affect the other powers of the governments of member states" was passed. The constitution would be modelled on that of Australia. Commenting on the proposal, the secretary of state for the colonies said in London that the British government had a special responsibility for Africans and pointed out that no African took part in the conference. Philip J. Noel-Baker, secretary for commonwealth relations, after consultations in December with T. H. W. Beadle, Rhodesian minister of internal affairs, recommended further investigations of the problem between the parties concerned.

The minister of finance, E. C. F. Whitehead, headed a delegation to London to present to the British government the colony's four-year plan for loan expenditure and to ascertain whether British industry could supply capital goods for the production targets.

Whitehead also attended the conference of commonwealth finance ministers in London.

A royal commission on town-planning and a special research department for conservation works were established. Price control was removed from a wide range of commodities during the latter part of the year and permit control of building ceased except in Salisbury and Bulawayo.

Budget changes included a tax on undistributed profits, an increased duty on imported spirits, a higher surcharge on cigarettes, reintroduction of the *2d.* rate for postage within the colony, doubling the rate of transfer duty on property valued at more than £20,000, an increase of *3d.* per gallon on gasoline, a tax on nonindustrial native labourers and an increase from 20% to 30% in entertainment tax. A 20% export tax was imposed on Virginia flue-cured tobacco. This caused considerable controversy and was reduced to 15%. Later it was withdrawn in favour of a five-year loan of 15% of the proceeds of tobacco sales.

A new peacetime establishment for the territorial force was approved, comprising armoured cars, artillery, engineers, signals, two battalions of infantry and a medical corps. The annual defense force camp was attended by units from Northern Rhodesia, Nyasaland and Kenya.

The government assumed control of all base mineral exports. The gold subsidy was modified to the advantage of low grade workings and was withdrawn when the pound was devalued. A bill was introduced to terminate within six years the mineral concessions granted to the British South Africa company without compensation; this was amended to include compensation after six years. An agreement was completed with the Wankie Colliery company for the company to retain an area containing 350,000,000 tons of extractable coal for 100 years. The estimated production in 1949 was more than 2,000,000 tons and plans were to raise it to 3,500,000 tons a year. (*See* also RHODESIA, NORTHERN.)

Education.—European (1949): governmental primary schools 69, pupils 12,377, teachers 447; high schools 11, pupils 4,531, teachers 265; aided private schools 21, pupils 3,638; aided farm schools 13, pupils 195. Asiatic and mixed (1949): government primary schools 12, pupils 1,774, teachers 60; aided schools 4, pupils 886. Native (1948): primary schools 1,994, pupils 204,172, teachers 5,327 African and 204 European.

Finance and Banking.—Budget: (1948–49 actual) revenue £13,575,000, expenditure £13,546,000; (1949–50 est.) revenue £15,059,000, expenditure £16,480,962. National debt (March 1949) £75,380,359. Currency circulation (March 1949) £8,402,000 (including Northern Rhodesia and Nyasaland).

Trade and Communications.—(Jan.-July 1949) Imports £28,992,000, exports £15,578,000, re-exports £2,548,000. (1948) Main roads: *c.* 15,500 mi., including *c.* 2,500 mi. with tar-macadam strips. Railways 1,352 mi.; passenger traffic 2,829,913; freight traffic 5,096,986 long tons.

Agriculture.—Tobacco (Virginia, 1948–49) 81,714,330 lb. Livestock (1948): cattle 2,821,000; sheep 301,000; goats 555,000; pigs 103,000.

Industry.—Fuel and power: coal (in long tons) (1948) 1,869,000; electricity (1948–49) 173,000,000 units sold. Raw minerals: gold (1948) 514,440 oz,; asbestos (1948) 69,000 long tons; chrome (1948) 254,000 long tons. (G. R. MN.)

Rice. The U.S. rice crop of 1949 was the fourth consecutive higher-record crop, reaching 89,141,000 bu., 42% larger than the 1938–47 average of 62,944,000 bu. and 5% larger than the 85,056,000 bu. of 1948. The acreage, in contrast with a government-announced goal of 1,600,000 was at a record level of 1,821,000. The yield of 49 bu. per acre exceeded that of 47.8 for 1948 and 46.6 bu. as the average for the previous decade. Louisiana continued as the leading producer (24,559,000 bu.), and California (21,462,000 bu.) moved into third place with a crop 6,000,000 bu. larger than in 1948.

The price received by farmers for rice during 1949 was much lower than the peak price of $3.12 per bushel received in Feb. 1948, and declined rather sharply during the year from $2.47 per bushel in January to a low of $1.70 in September, after which there was modest recovery. The secretary of agriculture ordered a 13.7% cut in the acreage to be planted in 1950, a goal of 1,593,000 to produce 74,293,000 bu.

World rice production in 1948–49 of 144,200,000 metric tons (paddy) was an increase over the 142,500,000 tons of 1947–48, but 2% below the prewar average, although acreage was 3% above prewar. Rice production in Japan, Malaya and the Philippines exceeded the prewar level, and there was substantial recovery in south Korea and Indonesia. Indian acreage was increased about 10% compared with prewar, without, however, reaching the prewar production level. World trade in rice reached 3,500,000 tons, still 60% below the prewar average, mainly affecting the imports of Japan and India.

Preliminary indications were that the 1949–50 rice crop would be 2% to 4% less than in 1948–49, primarily because of the less favourable weather conditions in the main producing areas of Asia. (*See* also FOOD SUPPLY OF THE WORLD.) (J. K. R.)

Rio De Oro: *see* SPANISH COLONIAL EMPIRE.
Rio Muni: *see* SPANISH COLONIAL EMPIRE.

Rivers and Harbours. In 1949, construction was executed on 81 regular river and harbour projects by the U.S. army corps of engineers; of this number, 23 were completed. Maintenance was performed on a total of 336 projects, including the extensive intercoastal waterways and Mississippi river system, the connecting channels on the Great Lakes, the 490 navigation locks and dams, and 270 harbours, and also channels and canals of the Ohio river system, the Upper Mississippi river, the Illinois waterway, the hydroelectric generating plants on the Missouri river at Fort Peck, Mont., and the Columbia river at Bonneville, Ore. During the fiscal year which ended June 30, 1949, $178,301,100 was expended for new work and maintenance of river and navigation projects and inland and coastal harbours.

The Rivers and Harbors act of 1949 provided $197,985,690 for maintenance and improvement of the nation's rivers and harbours. Of this total $114,145,690 was designated for new construction work on 92 projects in 34 states, the District of Columbia and Alaska. Maintenance, operation and care were allotted $77,000,000; advance planning, $2,000,000; preliminary examinations and surveys, $1,200,000; and miscellaneous items, $5,640,000. Important river and harbour projects allocated $1,500,000 or more for construction were: McNary Lick and dam, Columbia river, Oregon and Washington, $35,000,000; Missouri river, Kansas City, Mo., to Sioux City, Ia., $2,500,000; Mississippi river, between Ohio and Missouri rivers, $9,750,000; Missouri river, mouth to Kansas City, $2,250,000; Gulf Intracoastal waterway, New Orleans district, $2,500,000; St. Marys river, Michigan, $2,700,000; Cleveland harbour, Ohio, $1,500,000; Missouri river at Fort Peck, Mont., $2,500,000; Monongahela river, Pennsylvania, $3,500,000; Jim Wood-

GERMAN PORT OF BREMEN which profited considerably in 1949 by a decision of the U.S. military government to use it as a port of entry for overseas shipments

ruff dam, Florida, $7,500,000; Chief Joseph dam on Columbia river, Washington, $5,000,000.

Advance planning was executed during 1949 on 16 river and harbour projects in ten states. The more important of these planning projects were the Lower Monumental Lock and dam, Snake river, Washington; Arkansas river and tributaries, Arkansas and Oklahoma; Alabama-Coosa river, Alabama and Georgia; Tennessee-Tombigbee waterway, Alabama and Mississippi; McGee Bend dam, Angelina river, Texas; and Dover Lock and dam, Kentucky.

At the end of 1949, there were 1,036 authorized investigations in advance stages of completion. Included in the studies were the Trinity river, Texas; the coast of California, to determine the advisability of providing harbours of refuge for small craft; major coastal harbours to determine the advisability of increasing harbour depths to accommodate the new types of deep-draft tankers and cargo ships; beach erosion control studies of the Connecticut shore and of the Illinois shore of Lake Michigan; and a comprehensive survey of the water resources of Alaska for navigation, power development, flood control and related purposes. (G. Hb.)

Canada.—Both public and private pressure increased for action on the long-discussed St. Lawrence river seaway, particularly after discovery of the Quebec-Labrador iron ore deposits in 1948. The Canadian government made representations to the United States government to complete the necessary legislation to fulfill the 1941 agreement.

Awareness of the important role of Canada's rivers and harbours was reflected in the 1949–50 parliamentary vote of more than $31,000,000 for construction, repairs and improvements of rivers and harbours. In addition, $500,000 was voted to provide remedial works where navigation was endangered, $4,285,000 for dredging, and $5,000,000 for an icebreaker for the St. Lawrence.

Parliament voted the National Harbours board more than $7,000,000 for 1949–50 reconstruction and capital expenditures, compared with about $6,000,000 for 1948–49.

Latest complete statistics on harbour activities were for 1948 (with 1947 figures in parentheses): 106,279 arrivals (103,307) unloading 36,683,000 tons of cargo (32,740,358), and 106,511 departures (101,454) loading 20,029,190 tons (21,246,012).

During 1949, the National Harbours board engaged in large constructional works at Montreal, Halifax and St. John, New Brunswick. At Montreal, the Jacques Cartier pier was under reconstruction. Precast concrete cylinders, 70 ft. long, were being used to carry a concrete deck. (C. Cy.; X.)

Great Britain.—In 1949 the first year's working of the nationalized dock undertakings in Great Britain showed a deficit in operation of docks, harbours and wharves vested in the British Transport commission. The undertakings showed losses in all but two groups, although gross receipts were 25% above those for 1947. The total deficit for 1948 was £1,329,484. It was agreed that transfers to the commission should be effected by stages beginning with the south Wales docks and those at King's Lynn, Norfolk. The docks at Hull, Yorkshire, Grimsby and Immingham, Lincolnshire, were transferred on Jan. 1, 1949.

The final report of the working party on the turn-over in shipping was given special attention and measures were taken to carry out its recommendations. A joint consultative council was established. Its meetings provided opportunities for the exchange of views on the whole of inland transport. Wages questions, conditions of service or statutory committee matters were excluded. The council comprised members of the commission, the executive and trade union representatives.

The National Dock Labour board published its first annual report in 1949, covering the period June 28, 1947, when the minister of labour's scheme commenced, to Jan. 3, 1948. Port registers showed an average of 74,585 men, 91.7% available, for the half-year to Jan. 3, 1948. Certain local boards faced labour shortages and 3,000 men were recruited. Use of the scheme's provisions was urged by transfers from other ports.

At Liverpool, the radar station was used by nearly 250 vessels entering or leaving the port. Its value during foggy weather was proved; continuous position information was supplied to vessels. The war-damaged Gladstone-Hornby lock was repaired and put in commission in March. Princess Elizabeth opened the new entrance to Waterloo dock.

The Port of London authority celebrated its 40th birthday. An unofficial strike of dockers, from early May to July 11, cost the country a loss of 2,300 operating days and held more than 100 ships idle. Bow Creek wharf, rebuilt after bomb damage, reopened as one of the two main Thames iron and steel discharging points. Designs for a false quay 1,320 ft. long, 29 ft. deep alongside north quay, West India dock, were prepared and two diesel-driven floating grain elevators were ordered.

Work on the Manchester Ship Canal company's £4,000,000 new oil dock for 30,000 ton tankers began at Eastham, near the entrance to the ship canal. The dock entrance lock was planned to be 800 ft. long and 100 ft. wide.

At Southampton, four or five berths to deal with about 350 tankers annually were planned to accommodate the largest tankers foreseen. Plans were prepared for a new two-story terminal building and a new "berth 44" for passengers for the "Queen Mary" and "Queen Elizabeth" was begun.

Australia.—Legislation was adopted reconstituting the Stevedoring Industry commission which controlled port waterfront operations. The reclamation for the new Appleton dock, west of the Yarra, proceeded.

British East Africa.—Dar es Salaam, Tanganyika, progressed toward becoming a major port capable of accommodating 600-ft. ships of 30-ft. draft. Improvements to the entrance channel, increase of the lighter fleet, additional deep-water berths, cranes and rolling stock should, by 1951–52, enable the port to handle 850,000 tons of cargo annually, nearly twice the total for 1948. Construction proceeded on Mtwara port (former Mikindani).

British West Africa.—Work was commenced on the extension and development of the harbour at Takoradi, Gold Coast. The new work was expected to cost £2,250,000 and was planned to be completed by 1953.

Ceylon.—Work at Colombo port included the construction of an oil jetty and two alongside quay berths, enabling direct discharge to road transport.

France.—Works completed included repairs at Le Havre and reconstruction at Marseilles and Port du Bouc oil port (Marseilles).

India.—The ports at Bombay, Madras, Calcutta and Cochin were given development priority. French experts visited India and surveyed many ports and planned new shipyards. Kandla was being developed into a major port, capable of handling 3,000,000 tons annually. In Calcutta model experiments were conducted for the improvement of the river Hooghly.

Ireland.—Work began on Sligo's Irish-American Oil depot to store the oil demand for northwest Ireland and Donegal. The Dublin Port Works board began work on a scheme to provide additional berthage, shed accommodation and a graving dock.

Israel.—Constructional work proceeded at Haifa, and a £15,000,000 scheme was planned for Jaffa-Tel Aviv.

Netherlands.—A new industrial harbour of Maastricht was begun. The new inland port at Nijmegen, at the confluence of the new Maas-Waal canal with the Waal (Rhine), was taken into operation.

Pakistan.—The development of Chittagong into a major eastern port proceeded. The program provided for 14 additional berths.

Mozambique.—The Portuguese government took over control of the port of Beira and improvements proceeded. A port at Nacala, north of Mozambique, was under construction.

Singapore.—Rehabilitation and wharf dredging was completed and re-equipment proceeded.

Sweden.—The largest dry dock for use in the Baltic was towed in seven sections from Britain to Stockholm for Finnboda shipyard. (*See* also Aqueducts; Canals and Inland Waterways; Dams; Floods and Flood Control.)

Roads and Highways.

Progress was made in highway improvement in many parts of the world in 1949. In a few countries steps toward planning and constructing adequate highway systems were of a notable character. In some the increase in size of program gave promise of still greater accomplishments to come. But, in the United Kingdom and countries of Europe there was little betterment of highway systems. In China, where highway systems had grown rapidly during the past decade, even during Japanese occupation, there was every indication that work had ceased and that roads were falling into a state of disrepair. Elsewhere, in countries having to import road machinery and certain materials, there was difficulty in obtaining them, except in small quantities, because of the state of world commerce.

United States.—Highway work progressed at a more rapid rate than in any year since the end of World War II. In the first ten months of 1949 state highway departments awarded contracts for 40,181 mi. of construction to cost more than $1,000,000,000. The figures include 17,145 mi. of federal and federal-aid construction. In the fiscal year ending June 30, 1949, 21,032 mi. of highway were completed in the program involving federal funds, at a cost of $762,913,000. The federal assistance amounted to $401,968,000.

It was estimated that highway-construction expenditures by all agencies in 1949 would amount to $1,705,000,000 and that $1,295,000,000 would be expended for maintenance.

Highways of all classes were improved, the greater part of the work being to modernize old, worn-out highways to make them suitable for modern traffic. In numerous cities expressways were built to permit the flow of traffic at speeds of 35 to 50 m.p.h. without interruption or conflicts of any kind. Cities where large projects were under way included New York, Pittsburgh, Washington, Atlanta, San Antonio, Houston, Dallas, Fort Worth, Detroit, Chicago, Oakland and Los Angeles. (*See* also Bridges.)

In June the bureau of public roads reported to congress that serious deficiencies existed in the national system of interstate highways. This system, which included 37,800 mi. of the most important highways of the country, carried 20% of the nation's traffic.

All but 1,900 mi. of the 31,831 mi. of the system in rural areas required improvement to bring these routes up to standards recommended for existing volumes of traffic. Of the 5,969 mi. of roads and streets in urban areas, all but 398 mi. required some degree of improvement. The cost of improvement was estimated at $11,000,000,000.

Canada.—Highway construction outside of cities was to be completed at a cost of $234,000,000. Interest was centred particularly on completion of the 4,300-mi. Trans-Canadian highway from Halifax to Vancouver. There were 1,700 mi. still to be constructed.

Construction of a $13,500,000 highway and railroad bridge over the Strait of Canso, which separates Cape Breton Island from the mainland of Nova Scotia, was assured by the Canadian government. A board of engineers reported that it is feasible to bridge the strait, which is 3,000 ft. wide, 200 ft. deep in places, and subject to strong tidal currents.

Mexico.—This country also was having its greatest road-building year. Completion of the Inter-American highway across the country to the Guatemalan border was scheduled for the end of the year and the important main highway from Mexico City to Juarez on the border opposite El Paso, Tex., was nearing completion. Work progressed on the biggest highway job in the country—the Pacific coast-Mexican highway—a 1,640-mi. route down the coast to Guadalajara, and then inland to Mexico City. Construction of arterial routes had progressed to the point that attention was being given to the need for 62,500 mi. of secondary roads.

Inter-American Highway.—The Inter-American highway extends from Laredo on the border between Mexico and the United States to Panama city, a distance of 3,200 mi. The highway was not suitable for travel beyond southern Mexico. There were three large unimproved gaps. One about 80 mi. long was in southern Mexico and western Guatemala. The Mexican portion was nearing completion and work was in progress in Guatemala but completion was not in immediate prospect. Provision had not been made for closing the other gaps, about 65 mi. in northern Costa Rica and about 150 mi. in southern Costa Rica and northern Panamá. Near the close of the year 87% of the highway was passable at all times, 4% was passable in dry weather only, and 9% was impassable in all seasons.

South America.—Good progress was made in several countries of South America. The section of the Pan-American highway along the west coast of the continent remained in substantially the same condition as in previous years, that is, passable by vehicles but not suitable for tourist travel. Much improvement of the road and provision of tourist facilities would have to be made before long-distance travel could be recommended. However, the highway was of great service for local travel and was used to some extent for travel between countries. Ecuador began construction of a 69-mi. highway to complete a branch from the Pan-American highway at Quito to the seaport Esmeraldas.

In Brazil the highway programs directed by the national and state governments gained momentum. The national road organization reported in July that 430 mi. had been completed in the preceding 12 months. The national highway fund for 1949 amounted to $275,000,000 and other funds available to the national organization brought the total to $360,000,000. Important sections of the national system of highways, which also form a part of the Pan-American Highway system, were under construction. Tunnels on the four-lane divided highway connecting São Paulo with Santos were to be completed before the end of the year. In northern Brazil a new highway from Natal to Recife reduced travel time from 11 to 6 hr. Between Natal and João Pessoa the old route, 185 mi. in length, was shortened by 58 mi.

Venezuela launched a much enlarged highway program. Plans called for the surfacing of 500 mi. of existing roads and the construction of 400 mi. of new roads. A major highway project was the long-planned road between Caracas and the main seaport and airport at La Guaira. A four-lane concrete highway to replace the old narrow mountain road and reduce the distance from 20 to 10 mi. was begun.

United Kingdom and Europe.—Progress toward creation of the kind of improvements needed to make possible adequate highway transportation was disappointing. Economic and political troubles permitted little more than maintaining the badly worn and obsolete highways unsuited to motor-vehicle use. There was almost no major construction of modern highways to carry large traffic volumes.

Plans for an international network of main highways for Europe were advanced materially under the guidance of the Economic Commission for Europe (E.C.E.) of the United Nations. At a meeting held in Geneva in March, 12 governments and the occupation authorities of the western zones of Germany reached final agreement on a network of traffic arteries designed to meet existing needs and anticipated traffic requirements for the next 10 to 15 years.

Routes from Helsinki to Marseilles, from Edinburgh to Rome, and Paris to Warsaw were among the many included. Standard designs for three categories of roads in the system were agreed upon. The participating governments began studies of the conditions upon which the construction of the road network could be undertaken and financed.

U.S.S.R.—Detailed reports on road conditions in the U.S.S.R. were not available. The government organ *Izvestia* reported that there were only 90,000 mi. of roads and that the road-building program was being accelerated. Lack of good highways was a serious problem. According to *Izvestia,* 138 road-building organizations were to be in operation in 1949. Each would be expected to build 30 mi. of surfaced roads and 60 mi. of improved dirt roads annually. This would result in the improvement of 12,420 mi. per year.

India.—The government of India found it necessary to cut back on its original plan to spend $90,000,000 on a national-highway system. In the fiscal year 1949–50 it planned to spend $5,400,000 for new projects and $6,400,000 for maintenance. The expenditure at the close of the fiscal year 1949–50 would be only about one-third of that originally planned.

There were gaps of 1,802 mi. and a number of unbridged rivers on the system. A program to be completed in the near future provided for closing of 917 mi. of these gaps and bridging of several streams. The need for highway transport was so great that negotiations were being conducted to permit motor vehicles to cross some of the larger streams on railroad bridges. Construction of a bridge on the route between Bombay and Calcutta that would cost about $3,000,000 was begun.

Turkey.—The outstanding example of progress toward a modern system of highways was found in Turkey. Studies were made of highway needs, a system was planned, laboratories and machine shops were established, training courses were begun for machine operators, inspectors and other workers and actual construction was started. In 1948 the Turkish government expended $13,000,000 for labour and materials and the program was enlarged in 1949. Assistance had been given by the United States as part of the Turkish Aid program by allocation of $5,000,000 and a loan of equal amount for purchase of machinery and equipment. A group of engineers assigned by the United States government assisted the Turkish government in the various phases of the work.

Republic of the Philippines.—The rehabilitation of war-damaged highways, financed by the government of the United States, progressed rapidly during the year. This work, authorized in 1946, resulted in the completion of 65 mi. of highways and more than a score of bridges by July 1949. At that time 72 projects were under construction and 23 were to be started soon.

Roman Catholic Church.

During 1949, the Sacred College of Cardinals was reduced to 54 by the deaths of Emmanuel Cardinal Suhard, archbishop of Paris and Francesco Cardinal Marmaggi, prefect of the Congregation of the Council. No new cardinals were created.

Two canonizations took place. On May 15, Blessed Jeanne de Lestonnac, foundress of the Daughters of the Blessed Virgin Mary, was enrolled in the ranks of the saints, and on June 12 Blessed Maria Guiseppa Rossello, foundress of the Daughters of Our Lady of Mercy, was solemnly canonized.

An encyclical was issued demanding internationalization of Jerusalem and all other sacred places, freedom of education and worship for religious institutions and freedom of access for Catholic pilgrims in the new state. Concern for human rights was expressed by Pope Pius XII in his statement to the International Congress of Humanistic Studies. He declared that when the Catholic Church fights to conquer or preserve her own freedom she also fights for the true freedom of basic human rights. In a speech addressed to James D. Zellerbach, head of the European Recovery program, the pope unreservedly endorsed the Marshall plan and paid tribute to the generosity of the American people.

RELIGIOUS PROCESSION in Budapest, Hung., where the observance of Roman Catholic practices became a symbol of resistance to communism in 1949

The Supreme Sacred Congregation of the Holy Office issued a decree to the effect that Catholics supporting the materialistic and anti-Christian doctrine of communism are apostates from the Catholic faith and, therefore, incur excommunication.

In May Pope Pius XII promulgated a bull announcing the Holy Year of 1950.

In Hungary, Cardinal Mindszenty was arrested in Dec. 1948 and charged with suspicion of treason. He was sentenced to life imprisonment after a confession of guilt believed to have been the result of drugs and torture.

Archbishop Beran was confined to his palace in Czechoslovakia by the Communists. All schools were taken over by the state, collections were banned in the churches, political tutors were appointed to all Roman Catholic theological seminaries, the clergy were made dependent upon the state, church marriages were declared illegal unless preceded by civil ceremonies. Pope Pius excommunicated all government officials responsible for creation of what the Vatican considered a spurious "Catholic Action" organization in Czechoslovakia.

Poland followed the other "iron curtain" countries with church restrictions. Printing establishments were closed, priests excommunicating Communists were made liable to capital punishment or long prison terms, and religious orders and associations were obliged to register and seek permission to continue their existence.

The National Catholic Educational association held its 46th annual convention in Philadelphia, Pa., in April. In March the National Catholic Conference on Family Life met for its 17th annual convention in San Francisco, Calif. The Catholic Press association at their Denver, Colo., convention reported that the total circulation of Catholic publications had increased 150% in 25 years—from 5,600,000 to 14,000,000. The Inter-American Conference of Catholic Social Action held its third annual meeting at Rio de Janeiro, Brazil, in August. The 35th annual meeting of the National Conference of Catholic Charities was held in Atlantic City, N.J.; the 27th convention of the National Catholic Rural Life conference in Columbus, O.; and the 67th annual meeting of the Knights of Columbus in Portland, Ore.

The bishops of the United States issued a statement, "The Christian Family," which emphasized four principles of family life—permanence, freedom, economic security and religion.

Concern for the suffering children in many lands was expressed by Pope Pius XII in his March 2 radio address to more than 2,000,000 students of Catholic schools in the United States and he requested contributions from them as a special Lenten sacrifice. Msgr. Thomas J. McMahon, national secretary of the Catholic Near East Welfare association of the United States, reported that Catholic organizations had and would continue to have 2,000 priests and sisters working in the field assisting refugees. They had given regular assistance to about 200,000 of the 500,000 refugees. Msgr. Edward E. Swanstrom, executive director of the American Catholic relief agency reported that War Relief Services, National Catholic Welfare conference, had distributed so far 290,000,000 lb. of relief supplies valued at $130,000,000.

The world population of Roman Catholics was 423,000,000. In the United States, Hawaii and Alaska, it was estimated at 26,718,343, an increase of 642,646 over 1948. The hierarchy ruled 23 archdioceses, 101 dioceses and 1 vicariate-apostolic (Alaska). There were 4 cardinals, 20 archbishops, 157 bishops and 36 abbots. Parishes totalled 15,905, and there were 42,334 priests, 7,302 brothers and 141,606 nuns.

Bishop Mariano S. Garriga, coadjutor of the diocese of Corpus Christie, Tex., assumed direction of the diocese March 15, on the resignation of Bishop Emmanuel B. Ledvina, who retired because of ill health. The Most Rev. Emmet M. Walsh, bishop of Charleston, S.C., was named coadjutor bishop of Youngstown, Ohio, diocese with right of succession to Bishop James A. McFadden. Msgr. John P. Phelan, vicar general, was elected to serve as administrator of the diocese of Springfield, Mass., until the installation of a new bishop to replace the Most Rev. Thomas Mary O'Leary, who died Oct. 10. The Most Rev. Edward A. Fitzgerald, former auxiliary to the archbishop of Dubuque, Iowa, was made bishop of Winona, Minn. The Most Rev. Leo Binz, formerly titular bishop of Pinara and coadjutor to the bishop of Winona, was named titular archbishop of Silyum and coadjutor with right of succession to Archbishop Henry P. Rohlman of Dubuque. Msgr. Francis E. Hyland, pastor of the Church of Our Lady of Lourdes, Philadelphia, Pa., was named titular bishop of Gomphi and auxiliary to Bishop Gerald P. O'Hara of Savannah-Atlanta, Ga. Msgr. James H. Griffiths, chancellor of the Military Ordinariate, comprising all Catholics in the armed forces of the United States, was named titular bishop of Gaza and auxiliary to Francis Cardinal Spellman in his capacity as military vicar. The Most Rev. Francis M. Kelly, formerly bishop of Winona, was named titular bishop of Nasai.

Among the awards conferred during the year were the Magnificat medal given by Mundelein college, Chicago, Ill., to Mrs. Mary Blake Finan, Chicago social worker; the Catholic Action medal was awarded to Bruce M. Mohler, National Catholic Welfare conference, Immigration Bureau director by St. Bonaventure college, St. Bonaventure, N.Y.; Irene Dunne, movie actress, was presented with the Laetare medal by the University of Notre Dame; Etienne Gilson of France received the Christian Culture medal from Assumption college, Windsor, Ont.; the James J. Hoey Interracial Justice awards were received by Dr. John J. O'Connor, Washington, D.C., educator and writer, and M. C. Clarke, Cleveland, O., insurance executive.

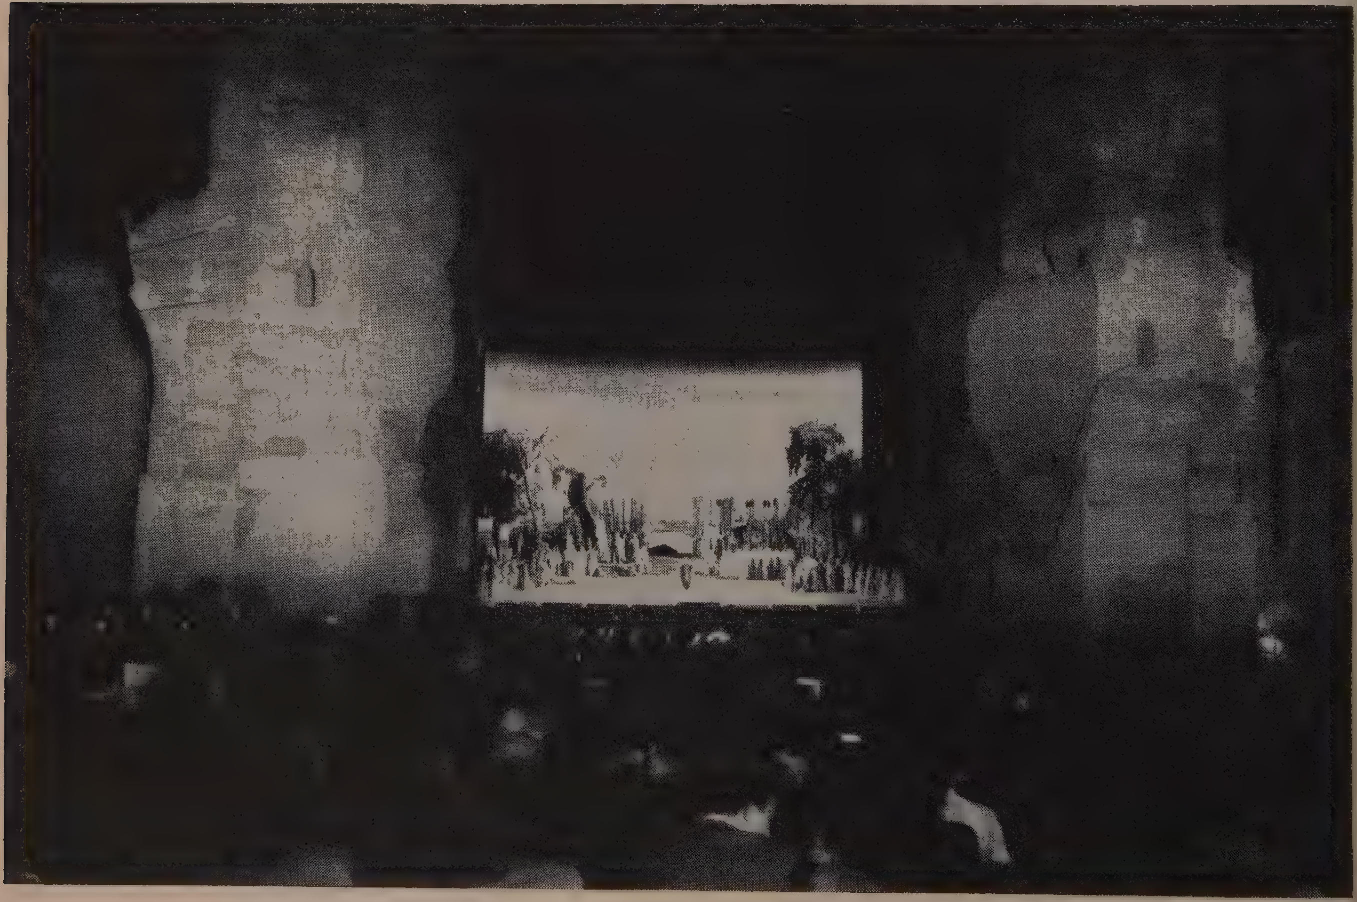
The Claver index, containing more than 35,000 reference cards on the subject of the Negro and the Catholic Church and of race relations, was installed at the Catholic Interracial centre at 20 Vesey St. in New York city. This unique collection was the life work of Father Arnold Garvy, S.J., of Chicago, and was being used by students and research workers from all over the country. The Catholic Interracial council of New York, N.Y., completed its eighth year of weekly interracial forums of leading speakers treating a wide variety of problems dealing with race relations. In addition to the 12 Catholic Interracial councils existing, 4 others were in process of formation during the year. (*See* also CHURCH MEMBERSHIP; RELIGIOUS EDUCATION; PIUS XII; SOCIETIES AND ASSOCIATIONS; VATICAN CITY STATE.) (J. LaF.)

Rome.

Capital and largest city of Italy. Pop.: (1936 census) 1,562,580, (July 1, 1948, est.) 1,613,660.

During 1949 traffic in Rome continued to multiply, especially the trolley buses, which were very smart and swift but as crowded as ever and up in price. The broken-down trolley cars of the immediately postwar period began to yield place to fine new ones but here, too, the overcrowding continued unabated. Most of all, motor bicycles increased, particularly the light "scooter type." The long drought brought a serious water shortage followed by an electricity famine, involving two days, and in the autumn three days, without current from 7 A.M. to 6 P.M.

OUTDOOR OPERA in Rome, Italy, where four operas were performed every week during July and August of 1949; it was Rome's greatest summer musical attraction and drew large audiences throughout the season



RINCETON UNIVERSITY CREW (far left) crossing the finish line 3 lengths ead of the Reading Rowing club (foreground) in the 14th heat for the ames challenge cup at Henley-on-Thames, Eng., June 29, 1949

Luxury apartments continued to go up in the wealthy suburbs, t in spite of much talk about the Fanfani plan very little else as built. Rome began to pride itself on having superseded aris in leading women's fashions, for Rome claimed that oman creations were more truly feminine. Social life became ther more feverish than ever before. The price of the *espressi,* nall cups of very good strong black coffee, which are a national ink, increased in some bars from 20 lire to 25 lire; this was minor blow for the already impoverished middle class.

A great many international gatherings took place in Rome in 49; there were also, of course, preparations outside the Vati- n city for the coming Holy Year. For the first time since the alian army conquered Rome from the pope on Sept. 20, 1870, e anniversary of that day was not officially celebrated. On ne 2, the third anniversary of the voting in favour of the esent republic, a monument was inaugurated to Giuseppe azzini. (*See* also ITALY.)

FILMS OF 1949.—*Ancient Rome* (Coronet Instructional Films).
(E. WI.)

omulo, Carlos P. (1901–), president of the general assembly of the United Nations, as born on Jan. 14 in Manila, P.I. After studying at the Uni- rsity of the Philippines, and in the United States at Columbia iversity, he taught English in the Philippines, then entered ewspaper work and became publisher of the *Philippines Herald.* survey of the far east that he made in 1941 won for him a ulitzer prize.

After the Japanese attack on the Philippines, Romulo was blic-relations officer to Gen. Douglas MacArthur, and was said be the last man to leave Bataan alive before its capitulation. e rejoined MacArthur in Australia as the latter's aide-de-camp, d later became a brigadier general in the U.S. army. He was ilippines delegate to the United Nations from that organiza- on's beginnings, and at the opening of the fourth annual ses- on of the U.N. in Sept. 1949, he was elected president of the neral assembly.

On receiving news of the Russians having brought about an omic explosion, Romulo said in September that the general sembly must itself face squarely the issue of atomic control, spite east-west deadlocks.

otary International: *see* SOCIETIES AND ASSOCIATIONS.

owing. The tempo of rowing increased during 1949. In England, 500,000 people watched Cambridge de- at Oxford by a quarter of a length in the closest finish since 1877. The time was 18 min. 57 sec. It was the Cantabs' 51st win in 95 races against Oxford.

In the United States there were four major regattas and many others of lesser importance. The fourth annual sprint championships of the Eastern Association of Rowing Colleges were held on Lake Onondaga, N.Y., with Syracuse university host. Fifteen thousand people saw 11 colleges and 32 crews participate. Harvard won all three events. At Poughkeepsie, N.Y., in the 47th annual Hudson river classic, 30 crews faced the starter in the three events. The University of California's Golden Bears dethroned the defending champion, the University of Washington, in the varsity race, but the Huskies took the junior varsity and freshman events. Yale halted Harvard's victory streak at New London, Conn., in the only four-mile race held in 1949 in the United States. At Buffalo, N.Y., the National Association of Amateur Oarsmen staged its most successful regatta.

In the Eastern Intercollegiate championships, Harvard dominated the field. In the freshman event Harvard's time was 6 min. 52.5 sec.; Massachusetts Institute of Technology was second and Princeton third followed by Cornell, Navy and Boston university. The junior varsity time was Harvard 6 min. 50.9 sec. with Princeton second and Yale third. Navy, Boston university and M.I.T. followed. The Crimson completed its sweep by winning the varsity race in 6 min. 48.8 sec. with the University of Pennsylvania second and Princeton third. Cornell, Yale and Navy trailed. Harvard made a perfect score in its triple triumph thereby winning the Rowe cup for the team championship. Princeton was second and Pennsylvania third in team scoring.

The Wright cup regatta for the lightweight championship of the east, held on Lake Carnegie, Princeton, N.J., went to Cornell over defending champion Princeton. The times were 7 min. 28.9 sec. to 7 min. 32.1 sec.: Harvard and Pennsylvania were third and fouth respectively.

The 47th annual Poughkeepsie classic was won by Ky Ebright's undefeated University of California varsity. The Golden Bears defeated a field of 12 major colleges in dethroning the Washington Huskies. The times: California 14 min. 42.6 sec., Washington 14 min. 45.1 sec., for the three-mile course. Cornell, Navy, Princeton, Pennsylvania, Wisconsin, Columbia, Syracuse, Stanford, M.I.T. and Rutgers followed in that order. Washington won both junior varsity and freshman contests at three and two miles in 16 min. and 9 min. 40.2 sec. respectively. The Poughkeepsie course was changed for the first time in many years by moving the finish one-half mile upstream in the interest of the spectators.

At New London, Coach Alan Walz' surprising Yale varsity beat favoured Harvard at four miles. Yale, stroked by Richard Krementz, won in 19 min. 52.8 sec. to Harvard's 19 min. 54.2 sec., a new record for the upstream course. It was Yale's first win over Harvard since 1935. The Blue also won the junior varsity contest, but Harvard took the freshman event.

The seventh annual Dad Vail Rowing association regatta was held at Poughkeepsie for the first time. Boston university crews swept the three races; water conditions became increasingly difficult as evidenced by the times for the Henley distance: freshman race 6 min. 33 sec.; junior varsity 7 min. 23.2 sec.; varsity 9 min. 16.6 sec. Eight colleges participated. Rollins college of Winter Park, Fla., was runner-up in the varsity race and Rutgers in the other two. For 1950, three new members were added to this association: Southern college, Lakeland, Fla., the University of Tampa, Tampa, Fla., and La Salle college, Philadelphia, Pa.

The 75th regatta of the National Association of Amateur Oarsmen was held at Buffalo, N.Y. The West Side Rowing club was host and won the Julius H. Barnes point trophy with victories in the light and heavyweight eights. Twenty-one rowing organizations were represented. Joseph Angyal of the New York Athletic club, singles champion in 1942 and lightweight champion for nearly a decade, won the championship singles. The Fairmount club of Philadelphia took four races and gained third place in team scoring. John J. Kieffer of that club won the quarter-mile dash, regaining his 1946–47 title. Eighty-one crews competed.

Schoolboy rowing showed still further progress. The 15th annual championships were held at Ecorse, Mich. Rudy Jezak of the Stuyvesant high school, New York city, won the singles title and the Washington and Lee high school of Alexandria, Va., the senior eights with the Lafayette high school of Buffalo second. Twenty-three schools of the United States and Canada were entered.

The 67th Royal Canadian Henley at St. Catharines, Ont., followed the National. St. Catharines Rowing club won the new Maple Leaf trophy with 318 points to 284 for the West Side Rowing club of Buffalo, defending champion. The Cleland memorial trophy went to St. Catharines Collegiate institute for high school eights. Joseph Angyal, newly crowned United States champion, won the Canadian title and the senior eight went to the Buffalo West Sides.

John B. Kelly, Jr., U.S. single-sculls champion for 1948, did not defend his title, but repeated his 1947 triumph in England by winning the Diamond Sculls. Princeton university lightweight eight again won the Thames challenge cup. Kelly remained abroad and won all the important European single-sculling championships, thereby becoming the amateur single-sculling champion of the world. To accomplish this feat, Kelly defeated Willie Collet, Belgian champion, at Brussels, Belg., Hans Jakob Keller, Swiss champion at Lucerne, Switz., and climaxed his season by defeating the best oarsmen of Europe and South America in the European championships at Amsterdam, Neth.

In professional rowing, Evan Padden, Australia, defeated Max Fisher of New South Wales for the world's professional single-sculling championship, which was vacated by Bobby Pearse. (C. L. Bt.)

Ruanda and Urundi: *see* Belgian Colonial Empire; Trust Territories.

Rubber. World production of natural and synthetic rubbers in 1949 was estimated at 1,895,000 long tons, and consumption at 1,870,000 long tons. Estimated consumption of the United States was 977,000 long tons, of which 407,000 were man-made. Outside the United States 33,000 long tons of synthetic rubber were consumed. Estimated production of crude rubber for 1949 was 1,455,000 long tons.

Table I.—*Production of Rubber in the Principal Countries of Its Origin*

(In thousands of long tons)

	1939	1948	First half 1949

Table IV.—*U.S. New Rubber Consumption, 1949*

(In long tons)

	January	February	March	April	May	June
Natural	50,188	46,285	53,108	47,859	46,128	47,117
GR-S	28,619	26,898	29,793	28,544	27,627	28,865
Butyl	4,698	4,522	5,358	4,882	4,799	4,992
Neoprene and N-type	3,448	3,191	3,595	3,028	2,841	3,092
Total	86,953	80,896	91,854	84,313	81,395	84,066

The low prices for rubber at midyear (average price, May–June, for first quality rubber 16$\frac{2}{5}$ cents a pound as against 18$\frac{1}{2}$ to 19$\frac{1}{4}$ cents through April 1949) caused concern in the rubber-producing countries. Reports from Malaya, the source of 46% of the 1948 natural rubber, attributed the lower prices to the U.S. synthetic rubber industry and to the minimum consumption of synthetic rubber prescribed by U.S. law.

It was announced in December that British and French far eastern rubber growers would spend about $1,000,000 in the United States in 1950 to be raised by a tax on all rubber exported from Malaya, Ceylon and Indo-China for the purpose of promoting increased use of crude rubber.

With reference to dollar exchange, rubber had become the most important single article of commerce in the British economy. The U.S. importation of 728,000 long tons of crude rubber in 1948 represented dollar payments more than twice the amount paid by the United States in 1939. The U.S. per capita consumption of new rubber in 1948 was 16$\frac{1}{2}$ lb. while for the rest of the world it was 0.9 lb.

Synthetic Rubber.—The most important source of synthetic rubber, government-owned factories in the United States, continued to produce large amounts of general purpose rubber, GR-S (Table IV), at the level price to the manufacturer of 18$\frac{1}{2}$ cents per pound. Provisions pertaining to the production and use of synthetic rubber were imposed by the Rubber Act of 1948, which provided regulation to insure consumption of general-purpose and special-purpose synthetic rubbers in quantities at least equal to the minimums specified as essential to

Reclaim	10,106	9,128	9,511	8,274	8,108	8,771

national security. This regulation involved only manufacturers of tires, tubes and camelback, and only smaller sized tires, mainly passenger car tires. The requirements in the first half of 1949 worked out so that one pound of GR-S was consumed for every three pounds of total rubber. In September the order was changed to permit one pound of GR-S to be used for four pounds of GR-S and crude rubber combined. The minimum tonnages required under the law worked out initially at 200,000 long tons a year for GR-S and 21,666 long tons of special-purpose rubbers, 15,000 long tons of which were for inner tube use.

Consumption of synthetic rubbers in relation to natural rubber for the first six months of 1949 is shown in Table IV, and for transportation and nontransportation uses in Table V.

By the end of 1949 GR-S factories had been equipped to produce up to 200,000 long tons of "cold" rubber, a superior tread rubber responsible for reported improvements in road wear of between 10% and 25% over tires made with crude rubber.

Among special-purpose synthetic rubbers used in the United States, Butyl continued in brisk demand for inner tube use; Neoprene was employed extensively in insulated wire and cable, and in other articles designed to resist oil and to stand flexing in the sun. N-type rubbers supplied the need mainly for structures with the lowest penetration by oil and for use in combinations with synthetic resins (see Tables IV and V). High styrene copolymers with butadiene extended their use to impart stiffening to rubber compounds, as are employed for heels. Acrylate copolymers were proving to be superior to other rubbers for service in sunlight and for withstanding higher temperatures in flexure. Silicon polymers of the Silicone and Silastic compositions were consumed at the rate of 250,000 lb. yearly, both for their advantage as sealing members in high temperature services and as electrical insulation.

The ultimate disposition of government-owned plants for synthetic rubber production was being considered by an interagency advisory and working committee (Robert C. Turner, chairman) reporting to John Steelman's office at the White House. This committee was drafting recommendations to congress on the basis of which legislation might be undertaken in 1950. The considerations involved were stockpiling of rubber, adequate supplies to the manufacturing concerns and the avoidance of factors involving shortages in supply.

The first annual report of the secretary of commerce under the Rubber Act of 1948 disclosed that in 1948 the required consumption of general-purpose synthetic rubber was 15% above the minimum amount required by the act. Of special-purpose synthetic rubber for inner tubes (Butyl) the 43,000 long tons used in 1948 far exceeded the minimum. Voluntary consumption by the industry in 1948 accounted for the consumption of approximately 112,000 long tons of general-purpose rubber in products free of control. Also, approximately 16,000 long tons of Butyl were consumed voluntarily as well as 38,000 long tons of other special-purpose synthetic rubbers. This voluntary consumption resulted either from better quality goods or lower cost of manufacture made possible by the synthetic rubbers.

Table VI.—*Rubber Products—Value for the U.S.*

	1947 Value f.o.b. plant	1939 Value f.o.b. plant
*Tires and inner tubes	$1,463,358,000	$503,448,000
Pneumatic casings	1,306,693,000	444,325,000
Inner tubes	150,001,000	55,938,000
Rubber footwear, pairs	159,190,000	43,112,000
Reclaimed rubber, pounds	36,040,000	16,962,000
Camelback and tire repair materials	42,714,000	19,428,000
Rubber heels and soles	72,175,000	31,335,000
Mechanical rubber goods	621,703,000	177,067,000
Druggist and medical sundries	44,440,000	13,733,000
Other rubber products	199,502,000	78,808,000

*Includes solid tires.

Reclaimed Rubber.—Reclaim (derived mainly from worn-out tires and tubes) is a supplement to new rubber. In 1948 the tonnage of reclaimed rubber used in the United States was 25% of the total new rubber consumed. This percentage compared with 29% in 1939 and 65% in 1942.

Finished Products.—In the United States in 1948, 70.6% of natural rubber consumption and 68.2% of synthetic rubber consumption was for transportation uses. Thus all other uses of rubber accounted for about 30% of the total new rubber consumed. The quantities of products manufactured in the United States for 1947 comprised 111,686,368 pneumatic tire casings, 97,596,708 inner tubes, 97,413,406 lb. of camelback and repair materials, and 635,762,626 lb. of reclaimed rubber. A comparison of the value of products in the years 1939 and 1947 respectively is presented for certain rubber commodities. (*See* also CHEMISTRY; PETROLEUM; RAYON AND OTHER SYNTHETIC FIBRES.)

Rumania.

A people's republic of southeastern Europe, Rumania is bounded on the north and northeast by the U.S.S.R., on the east by the Black sea, on the south by Bulgaria and on the west by Yugoslavia and Hungary. Area: 91,654 sq.mi. Pop.: (Jan. 25, 1948, census) 15,872,624. Languages (1948 census): Rumanian 85.7%; Hungarian 9.4%; German 2.2%; Yiddish 0.9%; others 1.8%. Religions (1947 est.): Greek Orthodox 81%; Greek Catholic 9%; Roman Catholic 7%; others 3%. Chief towns (pop. 1945 est.): Bucharest or Bucuresti (cap., 1948 census, 1,401,807); Cluj (110,956); Jassy or Iași (108,987); Timișoara (108,296); Ploești (105,114); Brăila (97,293); Galați (93,229). Chairman of the presidium of the Grand National assembly, Constantin Parhon; prime minister, Petru Groza.

History.—By a reshuffle of the government on April 15, Ana Pauker (*q.v.*) and Vasile Luca were made deputy prime ministers. This office was already held by Gheorghe Gheorghiu-Dej. These three people, who were also the three leading Communists of Rumania, thus formed an inner cabinet similar to the five deputy prime ministers of Bulgaria (*q.v.*).

During the year Rumania seemed in fact to be more thoroughly subjected to the U.S.S.R. than any of the other people's democracies. An indication of this was the replacement of the country's name by the initials R.P.R. (Republica Populara Română). While Hungarian or Bulgarian Communists still spoke of Hungary or Bulgaria, Rumanian Communists extolled the virtues and glories only of R.P.R. The attempt to concentrate patriotism on initials was an importation from the U.S.S.R.

A new trade agreement between Rumania and the Soviet Union, signed on Jan. 24, increased the mutual trade two-and-a-half times above the level of 1948. The sum was announced in soviet roubles—465,000,000 for 1949. The arbitrary nature of rouble exchange rates made it even more difficult to calculate how much Rumania was giving and receiving under this agreement than was the case when goods were priced in "1938 dollars." The number of soviet-Rumanian joint companies was increased by the creation of enterprises for joint exploitation of natural gas (Jan. 1949), metals, coal, building (July 5) and a soviet-Rumanian insurance company (July 29).

Rumania's system of alliances was completed on Jan. 26, 1949, when a treaty of mutual assistance was signed with Poland. The existing treaty of alliance with Yugoslavia was denounced by the Rumanian government on Oct. 1.

Collectivization of agriculture made some progress. The actual number of collective farms set up was however still small: only 55 at the end of September. As in Hungary, attention was concentrated on the liquidation of the *kulaks*. Mass collectivization was not to start until the power of the *kulaks* in the villages was broken and until adequate supplies of agricultural machinery were available in order to allow the new collective farms to benefit from the advantages of large-scale cultivation. The first process was supposed to take place by political education and by the initiative of the village masses themselves, but in practice was conducted by the party officials with the backing of the police. Even when violence was not used, economic strangulation was likely to be effective. A statement of the central committee of the Communist party, dated March 5, 1949, ordered "differential class taxation" and a "class policy in cereal collection and in the allocation of credits" to destroy the power of the *kulaks*. Supplies of machinery were to be provided by the tractor factory set up by the soviet-Rumanian joint company *Sovromtractor* and by the extension and improvement of the network of "machine-tractor stations," based on the similar institution in the U.S.S.R.

Official statistics published in October claimed that at the end of the third quarter of 1949 the targets set in the one-year plan for 1949 had been achieved to the extent of 109%. Among the more successful branches were lead and copper mining and some sections of machinery and chemicals, the least successful—the building industry. A new one-year plan was drawn up for 1950 and it was announced that in 1951 a five-year plan would be introduced. By 1955 yearly output of steel was to be five times that of 1938 and would be 1,250,000 metric tons. Output of coal was to be three times that of 1938, of cast iron eight times; of electric power four times the level of 1944. In 1955 Rumanian industry was to be capable of producing 6,000 tractors yearly and in that year Rumania would have, from various sources, a total of 25,000 tractors. This, it was officially stated, would constitute "a sound basis for socialist agriculture." An important construction project announced on May 26 was a Danube-Black sea canal. This would short-cut the Danube delta, and greatly facilitate trade between central Europe and the U.S.S.R.

From these various statements it could be concluded that the collectivization of Rumanian agriculture would for the time being move slowly but that the pace would be increased during the five-year plan period 1951–55. The pace would depend on the urgency of securing food and labour supplies from the countryside, and this in turn would depend on the priority given in Moscow to Rumania's industrialization. This would itself depend on Moscow's view of the international situation.

Political sovietization was carried further by the establishment in October of a state control commission similar to the organizations of the same name already existing in Yugoslavia and Bulgaria and modelled on the ministry of state control in the Soviet Union. (H. S-W.)

Banking and Finance.—Budget (1949 est.) balanced at 192,961,000,000 lei. Currency circulation (July 1948): 32,000,000,000 lei. Monetary unit: leu (pl. lei) with an exchange rate of 1 leu=0.65 U.S. cents (Dec. 1949).

Foreign Trade.—(1948): Imports U.S. $96,000,000, exports U.S. $160,000,000.

Transport and Communications.—Roads (1945): 43,163 mi. Licensed motor vehicles (Dec. 1948): cars 14,670, commercial vehicles 14,950. Railways (1948): 7,000 mi. Shipping (1948): number of merchant vessels 15, total tonnage 32,962. Telephones (1947): subscribers 127,153.

Agriculture.—Main crops (metric tons, 1947): maize 5,279,000; wheat 1,279,000; oats 180,000; barley 364,000; rye 66,000; potatoes (1948) 1,630,000; sugar, raw value (1948) 112,000; hemp (1948) 27,000; flax (1948) 3,700; cotton, ginned (1948) 3,000. Livestock: sheep (Dec. 1947) 7,000,000; cattle (Dec. 1946) 3,048,000; pigs (March 1946) 1,406,000; horses (Dec. 1947) 939,000.

Industry.—(1947) Industrial establishments 28,295; persons employed 462,305. Fuel and power: coal 162,000 metric tons; lignite 2,108,000 metric tons; natural gas 2,106,000,000 cu.ft.; electricity 712,000,000 kw.hr.; crude oil (1948) 4,500,000 metric tons. Raw materials (metric tons unless otherwise indicated, 1947): pig iron 91,000; steel 183,000; gold 2,231 kg.; silver 481,200 fine troy oz.; copper 531; lead 3,495; zinc 2,283. Manufactured goods (metric tons unless otherwise indicated, 1947): refined petroleum products 3,450,000; cotton yarn 11,300; cotton fabrics 3,200; sawn timber 1,359,000 cu.m.; cement 418,000.

Running: *see* Track and Field Sports.

Rural Electrification.

The increase in the number of electrified farms in the United States during 1949 was the largest recorded in any single year. As of June 30, 1949, the Rural Electrification administration estimated that 4,582,016, or 78.2% of the total number of farms reported in the 1945 farm census, were receiving central station electric service. This compared with 68.6% on June 30, 1948; 61.0% on the same date in 1947; 30.4% in 1940; and 10.9% at the start of the federal rural electrification program in 1935. REA estimated that at the close of its fiscal year on June 30, 1949, 1,277,153 farms were still without central station electric service.

During the calendar year 1949 REA borrowers, their consumers and REA itself established new peaks of operation and power use. In addition to a great amount of construction work to increase the capacity of their systems, the borrowers added an estimated 175,000 mi. of lines and 526,000 consumers to their systems. This increased their miles of line in operation by 23.0% and their number of consumers by 20.9%, the largest gain for any year of the REA program. At the end of 1949 the borrowers were serving a total of 3,044,000 consumers and operating a network of 934,000 mi. of lines.

The borrowers included 975 rural electric co-operatives, 41 public power districts, 24 other public bodies and 25 commercial power companies. They had 993 rural power systems in operation, an increase of 41 over 1948. REA approved loans for its borrowers amounting to about $421,000,000 during the calendar year 1949, about $37,000,000 more than during any previous year, increasing the cumulative total to $1,996,000,000. Loan funds advanced to borrowers during 1949 to pay for completed construction totalled $326,600,000, or about $41,900,000 more than the peak year of 1948. This brought loan funds advanced to $1,432,500,000.

REA borrowers distributed 30.3% more power in 1949 than in any previous year. They sold 6,199,000,000 kw.hr. of electric energy, exceeding sales of 1948, the previous high year, by 1,442,000,000 kw.hr. The average annual consumption of electricity per consumer on the REA-financed lines increased 145 kw.hr., from 2,084 to 2,229 kw.hr.

The power shortage continued to be severe in many sections of the country and prevented expansion of some systems. REA borrowers reported that some areas lacked generating capacity or transmission facilities or both.

During the calendar year 1949 about 13.0% of the total amount of power distributed by REA borrowers came from REA-financed generating facilities, but their output increased 29.5%. The installed capacity of REA-financed generators increased 32.5% to 335,000 kw.

The financial position of REA borrowers continued strong throughout 1949. At the close of the year they had paid $223,400,000 in principal and interest on their loans, an amount slightly above funds advanced by REA during the first five years of its program. Payments made by borrowers on principal in advance of due dates totalled $20,000,000.

On Oct. 28, 1949, legislation became effective to undertake a federal program of rural telephone loans, similar to the program of loans for rural electric service. The new program was to be administered by REA. (G. W. Hd.)

Canada.—Steady demand for service plus increased flow of transmission lines and hardware, and readily available electrical consumers' goods, kept power companies busy pushing their electricity to rural areas. At a cost of $3,000,000, about 3,000 more Alberta farmers were reached during the year. The Saskatchewan rural electrification program added only 1,200 farmers; and, to speed up the process, the provincial power commission was authorized to make a special study of the problems to be overcome. The Manitoba power commission pushed its plan to reach all accessible farms, and during 1949 spread into 38 additional rural areas and powered about 5,000 farms.

In Ontario, where the provincial government's hydro system has a practical monopoly of power development and distribution, rural electrification progressed strikingly. By the end of 1949 there were about 269,000 rural consumers, of which 40,000 were added during the year through the construction of 3,888 mi. of power lines. In 1949 the 1945-established Quebec rural electrification board reported that electricity co-operatives and private utility companies had built more than 9,000 mi. of rural lines.

Nova Scotia added 310 mi. of lines to its rural networks and connected up 1,500 additional rural and farm homes. (C. Cy.)

Russian Literature.

The year 1949 was characterized in soviet literature, not so much for any positive achievements as for the violent, almost daily attacks in the press on literary, dramatic, musical and film critics for their "formalism" and "homeless cosmopolitanism." This campaign of vituperation represented a further stage in the general "antiwestern" movement inaugurated with the notorious Zhdanov purges in 1946. Several hundred critics, including many prominent and regular contributors to the soviet press, were involved, the attackers frequently being attacked in turn and accused of the same sins which they had imputed to the others. A peculiar feature of this campaign was its latent anti-Semitic flavour. The word "Jew" was not used outright, but the context in which the expression "homeless cosmopolitans" appeared was more than suggestive. Many of the attacked happened to be Jews using Russian pseudonyms, and these latter were systematically and maliciously disclosed.

A violent antiwestern bias characterized also the nationwide celebrations of the 150th anniversary of Alexander Pushkin's birth. The exposure of "Anglo-American imperialists" was the keynote of many a new play and story. Others sounded an ultrapatriotic note, glorifying everything Russian. Of the works by established soviet authors the following must be mentioned: the first part of Fyodor Gladkov's autobiographical *Detstvo* (*Childhood*), a colourful realistic picture of prerevolutionary life in a Russian village; Valentin Kataev's novel *Za vlast' Sovetov* (*For the Power of the Soviets*), dealing with wartime exploits and experiences of some characters in one of his best earlier novels, *The Lone White Sail;* and Veniamin Kaverin's novel *Otkrytaya kniga* (*The Open Book*), giving the life story of a soviet woman doctor. Vera Panova wrote a new novel, *Yasny bereg* (*The Clear Shore*), about a collective farm. There were no notable newcomers to literature.

Alexey Remizov published in Paris his first book in Russian since 1931, *Plyashuschy demon* (*The Dancing Demon*), a typical Remizov whimsy, part autobiographical, part fantastic and dreamlike. Its best section consists of fictitious memoirs of an old Russian scribe whose soul migrates from one historical or semihistorical character into another. The period covered is from the end of the 16th to the middle of the 18th century, and the narrative reflects Remizov's interest in the development of the Russian language and his concern with the conflict therein between the native and the foreign bookish elements. The book contains also some straightforward, though subjectively coloured, literary and theatrical reminiscences, of great interest and value to the student of modern Russian literature. Chapters from a new novel by Mark Aldanov, apparently a sequel to his *Before the Deluge,* appeared in one of the Russian newspapers in the United States. Of the younger writers, Nina Berberova published in Paris a book of six long stories, *Oblegchenie uchasti* (*Alleviation of the Lot*), with *émigré* life for their setting. The historian of Russian literature in exile found much interesting material, especially in the memoir genre, in the three Russian journals appearing outside Russia: *Novy Zhurnal* (New York), *Vozrozhdenie* (Paris), and *Grani* (U.S. zone of Germany). The last named drew for contributions mainly upon displaced persons and former soviet citizens now in Europe. (G. St.)

Rye.

The U.S. rye crop of 1949 amounted to 18,697,000 bu., the smallest crop since 1934. It was only 71% as large as the 26,449,000 bu. produced in 1948 and only 53% of the 1938–47 average production of 35,109,000 bu. Much of the decrease was accounted for by a cut in acreage harvested to the lowest level since 1873, 1,558,000 ac. in 1949, compared with 2,096,000 in 1948 and an average for 1938–47 of 2,874,000 ac. The yield was near normal at 12 bu. per acre against 12.6 bu. in 1948 and a ten-year average of 12.1 bu. Only 47% of the acreage sown was harvested, the rest being used for pasture, cover crop or abandoned. More than half of the total production was accounted for by five states: North Dakota (2,748,000 bu.), Minnesota (2,550,000 bu.), South Dakota (2,470,000 bu.), Nebraska (1,606,000 bu.) and Wisconsin (1,196,000 bu.).

Average prices received by farmers for rye declined from $1.44 per bushel in January to $1.13 in June, then slowly recovered about half of the decline. A nonrecourse government price support loan was available to farmers on the 1949 crop at an average rate equal to 72% of parity or $1.27 per bushel. The year end carry-over on July 1 of 3,282,000 bu. was approximately twice as large as the carry-over in 1948 but less than half as large as average for the years 1938–47.

World rye production in 1949, estimated preliminarily at 1,655,000,000 bu., approximated the 1948 crop but was about 100,000,000 bu. below the 1935–39 average. The Canadian crop, estimated at 10,011,000 bu., was only 40% as large as the exceptional 1948 crop, whereas the European crop of 705,000,000 bu. was about 7% larger than in 1948. The estimated production of 925,000,000 bu. in the U.S.S.R. approximated that of 1947 and 1948 and exceeded the prewar average. (J. K. R.)

St. Croix: *see* Virgin Islands.

St. Helena. A British colony in the south Atlantic consisting of the island of that name and the two island dependencies of Ascension and Tristan da Cunha. Respective areas: 47, 34 and 45 sq.mi. Population (1946 census): 4,748, 292 and 230.

The colony's resources being inadequate to provide work for its inhabitants, 100 farm workers sailed for the United Kingdom during 1949 under a new government scheme for employment overseas. The fourth advisory council was constituted and appointed by the governor in June.

Finance.—Budget (1947 est.): revenue £83,628 (including £49,170 from grants), expenditure £96,278. (Jo. A. Hn.)

St. John: *see* Virgin Islands.
St. Kitts-Nevis: *see* Leeward Islands.

St. Laurent, Louis Stephen (1882–), Canadian prime minister, was born on Feb. 1 at Compton, Quebec, and educated at St. Charles college, Sherbrooke, and Laval university, Quebec city, Que. Called to the bar at Quebec in 1905, he practised as a lawyer until Dec. 10, 1941, when he entered federal politics as minister of justice and attorney general. From Sept. 4 to Dec. 10, 1946, he held the additional post of secretary of state for external affairs, but on the latter date relinquished the portfolio of justice. He was elected as liberal member for Quebec East on Feb. 9, 1942, and re-elected in 1945. In 1948 he succeeded W. L. Mackenzie King as leader of the Liberal party and on Nov. 15, when King laid down the office of prime minister, St. Laurent became the 17th prime minister of the dominion of Canada.

On June 27, 1949, for the first time St. Laurent led the Liberal party in a federal election, and won a crashing victory of 196 seats out of 262, the biggest governmental majority in Canadian history. He led two sessions of parliament, at which Canada became the first nation to ratify the North Atlantic treaty, and which took the final steps in nationhood by requesting amendment of the British North America act. In Feb. 1949 St. Laurent visited Pres. Harry S. Truman of the United States. (*See* also Canada, Dominion of.) (C. Cy.)

St. Louis. St. Louis, Mo., had a population of 816,048 in the 1940 federal census, with an additional 541,567 persons in the greater metropolitan area. In 1949 the metropolitan St. Louis census committee reported an estimated 905,000 persons in the city and 773,500 in adjoining areas. Mayor in 1949: Joseph M. Darst.

In the April 5, 1949, municipal elections the Democrats won control of the city government from the Republicans, who had been in control since 1941. The Democrats elected a mayor and gained a majority vote in the board of aldermen, with 16 votes to 14 for the Republicans.

Also in the municipal election a bipartisan board of 13 freeholders was selected to draft a new charter designed to modernize the city government. Drafting of the charter had to be completed by April 1950 for submission to voters.

Housing continued short in 1949, but plans were well under way for four large slum-clearance projects to be completed in five years with federal aid. A federal loan of $731,000 for preliminary work on the projects, to comprise 12,000 housing units, was approved.

A committee of business and industrial leaders was formed to work with the mayor in an effort to raise private finances for additional projects.

The city in 1949 issued a total of 6,068 permits for building construction valued at $30,575,441. Included were permits for 1,576 new housing units valued at $11,516,057. The razing of 407 old dwellings in the year brought the net gain in housing units to 1,169.

St. Louis entered 1949 with an accumulated operating deficit of $3,680,000, but this was expected to be reduced by an operating surplus of $500,000 anticipated for the end of the fiscal year in April 1950.

The tax rate was $2.74 on the $100 property valuation; assessed value of real and personal property $1,207,496,960; bonded debt $82,000,000. Expenditures for operating the city government in the fiscal year ending in April 1949 were $35,466,071. Receipts were $33,568,044. The budget for the fiscal year ending in April 1950 was $38,555,477 for operating expenses.

A 1947 census of manufactures report issued by the bureau of census listed 2,330 industrial establishments in St. Louis with an average of 141,232 employees for the year. (E. L. R.)

Salvador, El. A republic on the west coast of Central America, the only one without a Caribbean littoral, and the smallest but most densely populated country on the isthmus. Area: 13,176 sq.mi.; pop. (mid-1948 est.): 2,100,000. The capital is San Salvador (pop., 1944 est., 110,435). Other cities are Ahuachapán (13,765); Cojutepeque (15,317); Nueva San Salvador, formerly Santa Tecla (24,239); San Miguel (18,676); San Vicente (13,637); Santa Ana (47,631); and Sonsonate (17,540). Language: Spanish; religion: predominantly Roman Catholic. The government in 1949 was under the direction of a temporary junta.

History.—The revolutionary junta which replaced Pres. Salvador Castañeda Castro in Dec. 1948 maintained control over the country throughout 1949. However, preparations were made for drawing up a new constitution and returning to a democratic order.

The resignation of Lt. Col. Manuel J. Córdova (announced Jan. 5) as head of the five-man governing board left the chief direction of public affairs to Maj. Oscar Osorio. In October, however, Maj. Osorio and Reinaldo Galindo Pohl both left the junta to campaign for the election of their partisans to an assembly empowered to draw up a new constitution. Maj. Oscar Bolaños and Humberto Costa remained in the governing body. Two decrees of a strong nationalistic character were passed during the year: one outlawing all political parties with foreign financial support or with religious affiliations, and the other prohibiting commercial and industrial firms in the country from employing less than 90% national personnel.

El Salvador's favourable economic status was further bolstered in November by an increase of more than 65% in the value of its coffee on the world market. A new suspension bridge over the Río de la Paz boundary, jointly financed by Guatemala and El Salvador, was completed July 14.

The chief labour dispute was a strike of the International Railways workers beginning May 2 and ending May 17 with most of the demands of the workers being met. One government decree establishing a universal social insurance program for employees in the country and another formulating a settlement procedure for individual labour-management disputes went into effect Oct. 12.

Education.—There were 1,519 primary schools with 3,701 teachers and approximately 100,000 students in 1945; about 50 secondary schools enrolled 6,982 students; and the national university had 835 students. National appropriations for education in 1947 amounted to 2,903,040 colones.

Finance.—The monetary unit is the colón, valued at 40 cents U.S. on Sept. 12, 1949. The 1949 national budget called for expenditures of 62,002,514 colones. During the first six months of the year, customs receipts were up 5,000,000 colones over the same period of 1948. As of Aug. 31, 1949, the Central bank's gold and foreign-exchange holdings amounted to $34,800,000 ($28,000,000 on the same date of 1948). The foreign debt at the end of 1945 was $18,300,000.

Trade and Resources.—Exports in 1948 totalled $45,600,000, including gold, silver and specie ($40,100,000 in 1947); imports, at $41,500,000 ($36,900,000 in 1947). The United States took 77.33% of the exports and furnished 73.45% of the imports. Coffee (861,874 bags of 157 lb. each, valued at $36,167,047) was the chief export commodity. The 1948–49 coffee crop established a new national record of 1,190,920 bags. Other important crops (with 1948–49 production figures) were corn (247,277 short tons), cotton (5,150 short tons), sugar (25,450 short tons) and sesame seed (19,952 short tons). There were 764,778 head of beef cattle in the country in 1948.

Communications.—In 1948 there were two major railroads with 377 mi. of main lines; 700 mi. of surfaced highways and 1,250 mi. of all-weather dirt roads; 2,237 mi. of telegraph lines; 5,093 mi. of telephone lines; over 4,000 telephones; and approximately 14,500 radio receiving sets.

Salvation Army.

The Salvation Army is a world-wide religious and charitable organization, which during 1949 had corps and outposts in 94 countries and territories throughout the world and preached the Gospel of Christ in 81 languages and dialects. Its 17,329 corps (local units) included 26,511 commissioned officers, 97,369 local officers (laymen) and thousands of soldiers (members) and adherents.

In its social-service work, the Salvation Army finds practical manifestation of "Christianity in Action." This takes such forms as children's homes and hospitals, maternity homes and hospitals, family welfare bureaus, men's rehabilitation centres, boys' clubs, summer camps for needy mothers and children, missing persons bureaus and many other activities.

The International Salvation Army was commanded in 1949 by General Albert Orsborn, the sixth general, elected on June 21, 1946, with headquarters in London. In the United States, Commissioner Ernest I. Pugmire was the national commander, with headquarters in New York city. During the year the organization intensified its vigorous drive for increased missionary effort in many countries.

Salvation Army commissioners from all over the world met in London in July to discuss plans for the Salvation Army's continuing attack on godlessness and misery and suffering.

In the United States during 1949 the Salvation Army held 93,439 meetings on street corners. In its social-service program, 20,525 patients were treated in 6 clinics and dispensaries; 1,845 missing persons were located; 34 maternity homes and hospitals for unwed mothers cared for 2,285 women and children; 6,484 mothers and children were sent to summer camps. A total of 105 men's social-service centres provided shelter and work for 5,408 men.

In the field of prison work, 10,798 prisoners were assisted on discharge and given employment; 1,879 prisoners were paroled in care of the Salvation Army, whose officers devoted 17,012 hours to prison visitation. At its 70th annual convention, the American Prison association elected for the first time a Salvation Army officer, Envoy J. Stanley Sheppard, as president for 1950. (*See* also CHURCH MEMBERSHIP.) (E. I. P.)

Samoa, American.

The Samoan Islands extend from 13° 26′ to 14° 22′ S. lat. and from 168° 10′ to 172° 48′ W. long., and are about 2,700 mi. east of Australia and 2,200 mi. south of the Hawaiian Islands. American Samoa consists of the inhabited islands of Tutuila, Tau, Olosega, Ofu and Aunuu, and the uninhabited coral atoll, Rose Island. Swain's Island, 210 mi. northwest of Tutuila, was made a part of American Samoa in 1925. Total area of American Samoa is 76 sq.mi. and total population in 1949 was 18,373 with about four-fifths of the population on the main island of Tutuila. Pago Pago, on Tutuila, is the capital.

History and Government.—A tripartite treaty signed by the U.S., Great Britain and Germany in 1899 divided Samoa into two possessions with the U.S. receiving what is now American Samoa and Germany the rest. American Samoa is an unorganized U.S. possession governed by a naval officer appointed by the president. Capt. Thomas F. Darden, Jr., was appointed governor in 1949.

On Feb. 25, 1948, a bicameral legislature, known as the Legislature of American Samoa, was established in place of the old legislature, the annual *Fono*. The house of representatives consists of 54 members, popularly elected for two-year terms; the House of Alii is composed of the 12 persons who hold the highest-ranking titles in American Samoa. The legislature has only advisory powers. The governor also has an advisory council consisting of from five to seven Samoans. The judiciary consists of a high court, district courts and village courts. Each of the three administrative districts has a native governor appointed by the governor of American Samoa. They in turn appoint village chiefs.

Education.—In 1949 there were 46 public schools and 7 private schools. Total enrolment was 5,117 and there were 139 teachers. About 94% of the population was literate according to the 1940 census.

Production and Trade.—The main products are copra and native handicraft, principally mats and rugs woven from grass. Principal crops, with estimated annual production, are copra (1,725 metric tons), breadfruit (7,700 metric tons), bananas (19,492 metric tons) and taro (2,900 metric tons). Imports in the fiscal year ending June 30, 1949, totalled $886,701; exports amounted to $459,056. Total revenues during the fiscal year ending June 30, 1949, amounted to $422,739 and U.S. appropriations for American Samoa amounted to $55,000; expenditures totalled $626,775. Total resources of the Bank of American Samoa, an island government institution, amounted to $1,778,914 as of Nov. 12, 1947.

Transportation.—There are 65 mi. of roads on Tutuila, one air strip but no railroads.

BIBLIOGRAPHY.—Rupert Emerson *et al.*, *America's Pacific Dependencies*, (1949); U.S. Navy Department, *American Samoa: Information Transmitted by the U.S. to the Secretary-General of the United Nations Pursuant to Article 73(e) of the Charter* (June 1948); *Ibid.* (June 1949). (S. NR.)

San Francisco.

The resident population of the city of San Francisco, Calif., on Jan. 1, 1950, was estimated at 824,500. The U.S. census reported 827,400 residents on Aug. 1, 1945. Preliminary reports for 1949 revealed 19,300 births in San Francisco and 9,800 deaths. Elmer E. Robinson, mayor of San Francisco, took office Jan. 8, 1948.

The index of general business activity in San Francisco at the end of the first 11 months of 1949 averaged 0.3% above the same period a year before. Construction permits were up 9.8% in value; bank debits were 0.3% higher and postal receipts 16.9%. Department store retail sales were at about the same level as the preceding year, when they reached an all-time high. Movement of passengers and freight by airplane was up as were ship arrivals, electrical energy sales and domestic water consumption.

The number of taxable retail sales outlets in San Francisco on June 30, 1949, totalled 24,003. Estimated taxable sales for 1949 at retail amounted to $1,311,000,000. New industries and expansions for San Francisco during 1949 (preliminary estimates) amounted to 110 with outlays of $6,500,000, compared with 160 with outlays of $16,900,000 in 1948. Living costs average for the first three-quarters in San Francisco were 0.3% below the same period of 1948.

San Francisco's funded debt outstanding on Sept. 30, 1949, was $156,451,000. Estimated revenue receivable during the fiscal year 1949–50 amounted to $133,320,341, of which $60,647,398 was from taxes. The total assessed valuation for the 1949–50 fiscal year was $1,508,959,293. The tax rate for 1949–50 fiscal year was $5.66 per $100 assessed valuation.

Progress bonds for $87,050,000 were approved by the people of San Francisco at the Nov. 1947 election to provide for basic public improvements including $22,200,000 for rehabilitation of the municipal railway system; $22,850,000 for street improvements, including special provision for several major through streets and street extensions; $5,000,000 to provide off-street parking facilities to relieve congestion and expedite traffic; $12,000,000 to pay the cost of improving and enlarging public playgrounds and recreation centers for the city and county of San Francisco; and $25,000,000 to pay the cost of construction of a second pipe line across the San Joaquin valley to augment the existing water supply. During June and November 1948 bonds for $63,890,000 were approved by the people of San Francisco for additional basic improvements. They included $48,890,000 for school construction and $15,000,000 for sewage treatment works. During 1949 bonds for $10,000,000 for airport and $4,000,000 for water department storage facilities were approved by San Francisco voters. Most of the above projects would require several years for completion. (R. B. Kr.)

San Marino.

A small republic in northern Italy, San Marino is 14 mi. southwest of Rimini. Area: 38 sq.mi. Pop. (July 31, 1949, est.): 12,418. Language: Italian. Religion: Roman Catholic. San Marino is governed by two *capitani reggenti* appointed every six months by a grand council of 60 members elected by universal suffrage every four years.

History.—Elections held on Feb. 27, 1949, resulted in a clear victory for the existing Socialist-Communist Committee of Freedom which won 2,815 votes as against 2,010 by the Christian Democratic alliance. In the grand council the government had 35 seats and the opposition 25, against 40 and 20 respectively before the elections. Relations between San Marino and Italy were somewhat strained and the Italian government suspended arrangements to pay several hundred million lire arrears under a 1939 treaty regulating the financial relations of the two countries. As the finances of San Marino were in a poor state—the deficit of the 1949–50 budget being estimated at 220,000,000 lire—the government decided in July to open a gambling casino as a tourist attraction.

Finance.—Budget 1948–49 was allegedly balanced at 420,000,000 lire and that of 1949–50 at 492,000,000 lire. San Marino uses the Italian currency.

Santo Domingo: *see* Dominican Republic.
São Tomé: *see* Portuguese Colonial Empire.
Sarawak: *see* British Borneo.

Saskatchewan.

Central of three prairie provinces of Canada, Saskatchewan was created by parliament in 1905. Area: 251,700 sq.mi. of which 13,725 sq.mi. are lakes; pop. (1941) 895,922; (1949 est.) 861,000. Chief cities: capital, Regina (58,245); Saskatoon (43,027); Moose Jaw (20,753); Prince Albert (12,508).

History.—The only provincial Co-operative Commonwealth Federation (socialist) government continued in power during 1949. The legislature prorogued after giving royal assent to 136 bills. The most significant included: restriction of margarine colouring to 1.6 degrees; provincial action for a land conservation and irrigation program; appointment of a provincial power commission as wholesaler for rural electricity; creation of a $1,000,000 fund for loans and grants to deserving students.

Education.—After a special building survey, the provincial department of education announced that $5,000,000 would have to be spent between 1950 and 1954 to replace worn-out schools and provide necessary expansion. The latest revised statistics available in 1949 were for the 1946 provincially controlled schools: total enrolment 173,559; average daily attendance 138,267; teachers 7,031; total revenue $15,747,768.

Communications.—During 1949 117.5 mi. of highway were hard surfaced, 398 gravelled, 348 graded. The government-owned bus line reported a $14,000 loss for 1948.

Finance.—Reporting on the 1948–49 fiscal year, the provincial treasurer gave total revenues as $55,623,000, expenditures as $54,609,000. During the period the province's net debt was reduced to $114,627,370, fourth lowest in Canada, and the sinking fund was increased to $44,000,000, second highest in Canada. Because of a different system of budgeting, the estimates for the 1949–50 fiscal year appeared lower, but were in fact no reductions from the previous year. They were: revenues $49,110,950; expenditures $49,101,220.

Agriculture.—Drought cut into 1949 crop returns when 30% of the 120,000 farms got inadequate rain; about 45,000 farmers in the southern parts of the province received $13,000,000 in federal drought-loss payments. Some of the more major 1948 agricultural production figures (with 1947 in parentheses) were: gross value of principal grain crops, $381,600,000 ($379,176,000); wheat, 191,000,000 bu. (170,000,000 bu.); cattle marketed, 465,998 (481,405). Average cash income per farm in 1948 was $4,275.

Industry.—In May 1949 minimum wages were increased from $18.50 to $21 weekly in the larger centres, and from $16 to $18.50 in smaller towns. Average weekly wages in Oct. 1949 were $42.54, compared with the 1948 weekly average of $39.20. In mid-1949 the provincial department of resources reported that 123 new companies had incorporated in 1948 with a total authorized capital of $7,424,600.

Minerals.—During the year 12 United States companies searched for oil over a 36,000,00-ac. crown-land area. Oil production during 1948 and 1947 was as follows (with 1947 in parentheses): 113 (67) wells pumping 865,715 (614,117) bbl. Natural gas production for 1948 of 387,000,000 cu. ft. was 125% greater than for 1947. More than 1,200 radium claims were staked in 1948. The value of 1948 mineral production was an all-time high of $34,421,000, nearly $2,000,000 above that of 1947. (C. Cy.)

Savings Banks: *see* Banking.

Sawyer, Charles

(1887–), U.S. secretary of commerce, was born on Feb. 10 in Cincinnati, O., studied at Oberlin college, Oberlin, O., and at the University of Cincinnati and was admitted to the bar in Ohio in 1911. That same year he was elected to the Cincinnati city council. From 1921 he was a member of the firm of Dinsmore, Shohl, Sawyer and Dinsmore. He served as lieutenant governor of Ohio beginning in 1933, and won the Democratic nomination for governor in 1938, but was defeated in the election by John W. Bricker. In 1944–45 he served as U.S. ambassador to Belgium and minister to Luxembourg. He became secretary of commerce on May 6, 1948.

His activities and public addresses during 1949 disclosed that U.S. plans for combating a threatened economic slump included emphasis on public works programs in industrial areas that were hardest hit. When in July President Truman named a 20-man panel to co-ordinate government buying and place contracts especially in the hardest-hit areas, Secretary Sawyer was delegated to choose the areas to be assisted first. The first area he chose was New England, and by August his department was able to report an upswing in business. On Aug. 30 he was directed by President Truman to report on methods of unifying government transportation programs.

Schuman, Robert

(1886–), French government official, was born on June 29 in Luxembourg. Admitted to the bar in Metz before World War I, he was elected deputy of the recovered *département* of Moselle in 1919 and was afterward continually re-elected. On March 21, 1940, he was appointed undersecretary of state in Paul Reynaud's cabinet, and in April 1941 he was arrested by the Germans and sent to Germany, but he escaped and went into hiding in France. In Oct. 1945 he was again elected deputy of the Moselle, and later re-elected. He held various cabinet posts from 1946 to 1948, twice during that time heading governments himself (Nov. 1947 to July 1948, and briefly in Aug. 1948). On Sept. 11, 1948, he became foreign minister in Henri Queuille's cabinet.

On April 4, 1949, in Washington, he signed the North Atlantic treaty for France. In the French national assembly on July 25, in the debate on the ratification of the North Atlantic treaty, he declared that it had been forced upon France by the eastern bloc which came into existence even before the signature of the Brussels treaty. On Aug. 10, he was present at the opening of the first session of the Council of Europe at Strasbourg. On Oct. 28 he was re-appointed minister of foreign affairs in the Georges Bidault cabinet. Speaking on Nov. 13 at Montigny, Loiret, he said: "Geography makes it necessary for us to build a Europe with Germany. We must give Germany her place in Europe, but nothing more than her place." (*See* also FRANCE.)

Schweitzer, Albert (1875–), French theologian, philosopher, musician and physician, was born in Kayserburg, Alsace, on Jan. 14. His musical education was started at home, beginning with the piano when he was five and the organ when he was eight. He attended the *gymnasium* at Mulhouse, France, and in 1900 took his licentiate in theology at the University of Strasbourg. While still at work on his *Quest of the Historical Jesus*, a historical criticism of the New Testament, he began in 1903 the biography of J. S. Bach later recognized as the definitive account of that master's life. In his autobiography, *Out of My Life and Thought* (1933) Schweitzer wrote that he had "settled" with himself to consider his life justified if he lived until he was 30 for science and art, in order to devote himself from then on to the direct service of humanity. Accordingly, he began the study of medicine (1905–11) to prepare himself for the life of a medical missionary, at the same time continuing to give organ recitals before the Paris Bach society which he had founded. He married Hélène Bresslau, a nurse, in 1912, and two years later the couple took up duties at a missionary post at Lambaréné, French Equatorial Africa. There, between intermittent periods of lecture and concert tours in Europe and time out for additional study and writing, Schweitzer spent the years attending to a steady stream of native patients, and supervising the hospital at Lambaréné which was gradually enlarged through his efforts. His unique devotion to the service of humanity, his compelling example of a philosophy lived in practice, as well as his versatility—all these in an era of cold wars and specialization of interests—commanded increasingly wider attention during the 1940s and led to the reissue of many of his earlier writings. In 1949 he visited the U.S. as principal speaker at the Goethe bicentennial convocation in Aspen, Colo.

ALBERT SCHWEITZER with Mrs. C. S. Clark, president of the Conference of Club Presidents, and Program Chairmen at a luncheon in Chicago, Ill., where he received an award for his service to humanity. Schweitzer was on a visit to the U.S. to attend a Goethe bicentennial convocation which opened at Aspen, Colo., June 27, 1949

Sculpture. Following divergent directions during 1949, sculpture increased the gap between classical and experimental forms which had prevailed since the first decade of the 20th century, thus continuing as perplexing to many as in other ways it was satisfying to many more. Major work was done in the monumental field supporting the classical form; but further significant progress was made with experimental work by artists who sought the acceptance of their theories by museums and art collectors with new signs of approval. To a larger number of new practitioners the experimental trend appeared popular.

Because of the increasing acceptance of abstract formalism, nonobjective and expressionist sculpture flourished in the leading art centres of the world, notably those of Paris, London and New York city; widely scattered museums took up the trends, recognizing it as their duty to show and explain them. Exports ranged from the neoclassical work of Aristide Maillol, through the romantic of Marino Marini and Ernst Barlach, who were popular, to the strongly expressionist work of Henry Moore and Jacques Lipchitz. In scholastic quarters interest was fed by the encouragement toward creative activity shown by progressive art schools and universities.

Despite the seething concern for new ideas, major achievement was shown in classical sculpture projects, such as the monumental works of James Earle Fraser and Leo Friedlander for the Lincoln Memorial circle at the approach to the Arlington Memorial bridge in Washington, D.C. (four heroic equestrian groups for this site having reached the bronze-casting stage). With memorial sculpture in wide demand, among the prominent examples completed were a bust of former Secretary of Defense James Forrestal, designed by Kalervo Kallio, son of the former president of Finland, for the national capital, and a heroic George Washington figure for the Masonic national memorial, Alexandria, Va., completed by Bryant Baker.

Abstract sculpture undertook to supply fresh solutions for monumental and decorative projects, receiving occasional encouragement, while appealing routine work was done in various styles for public and business buildings, notably in the relief form. Most unusual was the adaptation of sculpture to a new purpose by Isamu Noguchi, who turned his talent for imaginative abstract forms to the designing of modern furniture, considering a chair or a table as another piece of sculpture. This original work seemed a likely solution of the problem of furniture for modern, open homes where the object would stand by itself, to look right from all angles.

The most fruitful field was perhaps that embraced by experimental sculptors who, like Noguchi, drew upon organic and biomorphic forms as a basis for their own free invention. With Constantin Brancusi, a pioneer of this trend in semiretirement, powerful influences were Pablo Picasso, who had turned strongly to expressionist sculpture, Hans Arp, the Italian Alberto Viani and the Englishman Henry Moore. Moore, a challenging figure, was honoured by an impressive exhibition at Wakefield in Yorkshire, later seen in Brussels and Paris at the beginning of a long continental tour. Viani, with the classical sculptors Giacomo

Manzù and Marino Marini, who drew impressively upon classical and Etruscan sources, were admirably shown in New York's Museum of Modern Art exhibition of contemporary Italian art during the year.

Various sculptors were seen to advantage: in England F. E. McWilliam, who exhibited a number of surrealist pieces; R. Butler, who showed ingenious inventions in wrought iron, and Robert Adams, who in London and Paris showed a developing skill in semiabstract carving. In the United States, José de Creeft, doing romantic and decorative work; Theodore Roszak, experimenting in metal; the romantic Koren der Harootian and David Hare, who exhibited expressionistic sculpture, all worked in the forefront of the profession. Sculptors such as Fritz Wotruba in Austria, Frank Dobson, Ben Nicholson, Barbara Hepworth and Karin Jonzen in Britain; Ivar Johnsson and Bror Hjorth in Sweden, John Raedecker in the Netherlands and Gerhard Marcks in Germany were also among the active.

Organized groups supported sculpture: the Royal Society of British Artists in London concentrated, in their winter exhibition, upon the medium and produced the most lively mixed show of the year. The Whitney Museum of American Art, New York city, devoted most of one of its annual exhibitions to sculpture, placing a strong accent on advanced contemporary styles. Perhaps the largest concentration of all was the massive Sculpture International, third of a series in Philadelphia, Pa., which assembled quantities of work from abroad as well as work by U.S. sculptors.

Two traits which seemed to predominate during the year were diversity of material (allied to a consciousness and respect for its innate qualities) and a growing tendency among sculptors to think less in terms of the solid form than of space itself. It was thus but one step farther from representation to exploration of the hollow, the declivity and to the meaning of inner form. Lipchitz, Alberto Giacometti (who remained a strong influence), the followers of the Russian constructivists Naum Gabo and Antoine Pevsner and Moore were seen to pursue this course until they had pierced their solid material through and through. Younger artists supported this preoccupation, and, finding new instruments as well as diverse materials, resorted to fusing and forging. In many a modern workshop sculptors wielded the blowtorch as well as the chisel, fashioning by welding as well as by carving. In these ingenious ways sculpture pushed forward into a future of the widest unusual possibilities. (*See* also ART EXHIBITIONS.)

Secondary Metals.

The salient data on the recovery of secondary metals in the United States during recent years are shown in Table I, as reported by the U.S. bureau of mines.

Tonnages recovered from old scrap are shown in addition to totals, as it is only old scrap that adds to the current supply; new scrap recoveries represent the rehabilitation of new metal not yet put into use and so do not represent an increase in the supply.

Iron and Steel Scrap.—Data on consumption and consumers' stocks of iron and steel scrap during recent years are shown in Table II, as reported by the U.S. bureau of mines.

1948	79,340	29,191	29,079	4,031	1,384
1949 (9 months)	65,011	18,456	21,541	2,940	1,367

For the first time since before World War II the ratio between purchased and plant scrap was back to a 50:50 normal in 1948, but purchased scrap became scarcer in 1949. Stocks improved appreciably in 1948, but it is to be noted that all of the increase was in purchased scrap; stocks of plant scrap dropped even lower than during the war years, indicating prompt utilization of the available supply. (G. A. Ro.)

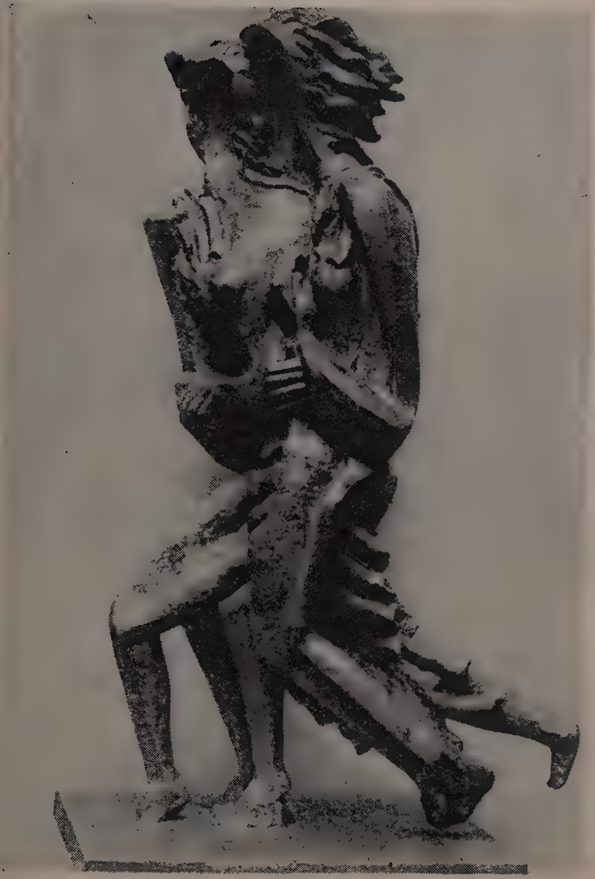
Secret Service, U.S.

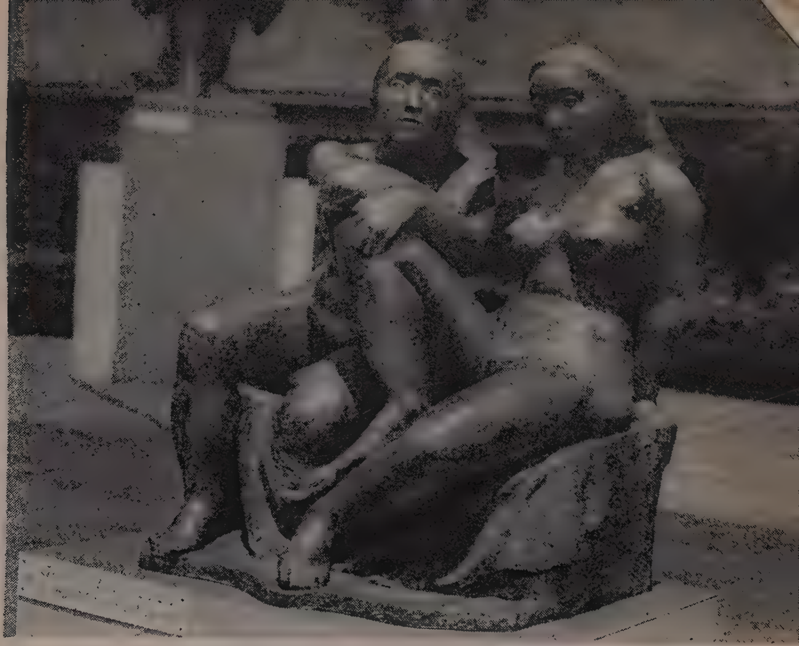
The major responsibilities of the United States secret service, an agency of the treasury department, are the protection of the president of the United States, of members of his family and of the president-elect, and the suppression of counterfeiting and forgery of currency, checks, bonds and other government obligations.

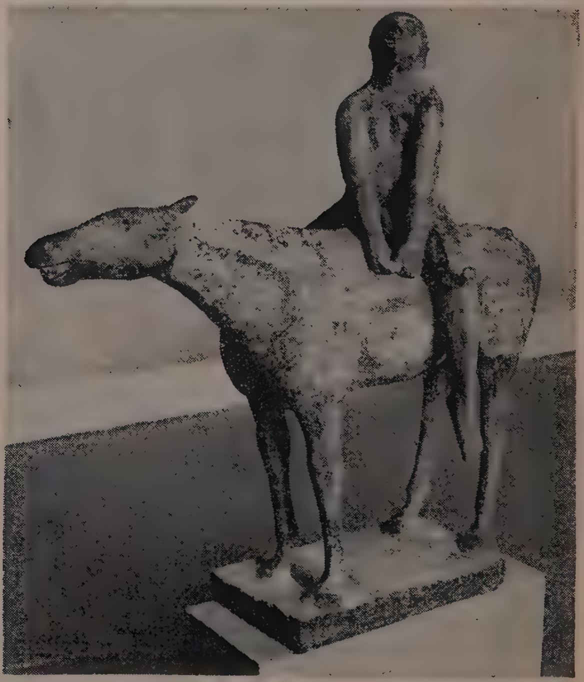
For the fiscal year 1949 secret service agents captured $949,742 in counterfeit bills and $8,021.61 in counterfeit coins in the United States. Of these totals, $331,021 in counterfeit paper money and $7,041.84 in spurious coins represented losses to merchants and other victims of passers. The balance was captured before it could be circulated. The total of counterfeit bills included $158,978 made in foreign countries.

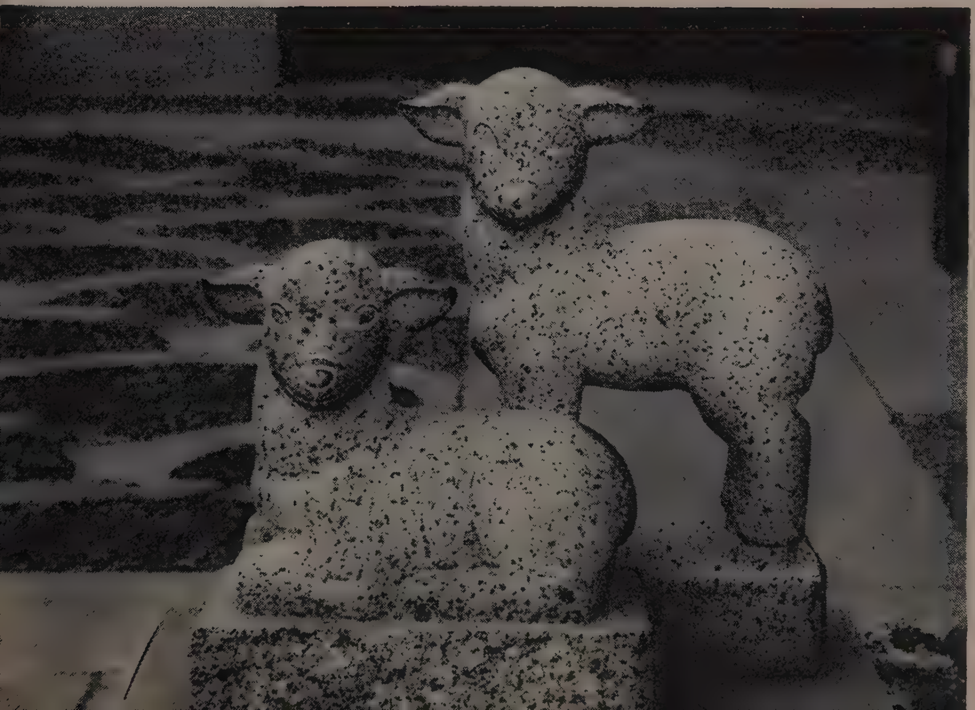
There were 114 new counterfeit note issues during the year. Agents captured 10 plants for the manufacture of counterfeit bills and arrested 207 persons for violating the currency laws, an increase of 31% in arrests, as compared with the previous year.

For the first time in several years the secret service captured a gang of postage-stamp counterfeiters in New York city and seized 8,000,000 counterfeit three-cent stamps. The offenders were also involved in the counterfeiting of currency and of









CONTEMPORARY SCULPTURE exhibited at the third Sculpture International organized by the Fairmount Park Art association and placed on view at the Philadelphia Museum of Art in June 1949. The comprehensive exhibit included 252 pieces by artists from 13 nations. Above, left: "Menades" (bronze) by Ossip Zadkine of France; above, right: "Gemini # 1" (bronze) by Oronzio Maldarelli of the U.S.; above: "Cavaliere" (bronze) by Marino Marini of Italy; left: "Lambs" (granite) by Sylvia Shaw Judson of the U.S.

traveller's checks.

In November, the secret service arrested a man in New York city who attempted to negotiate $244,000 in counterfeit bonds of the kingdom of Belgium.

The secret service received for investigation 34,160 government checks bearing forged endorsements and 7,312 forged government bonds. Agents completed investigations of 33,427 forged checks totalling $2,255,829.63 and of 9,105 forged bonds with a maturity value of $617,767. There were no losses to bond purchasers whose bonds had been stolen and fraudulently negotiated, since the government replaces all such bonds. There were 2,001 persons arrested for check and bond forgery. At the close of the fiscal year 1949 there were 11,221 forged checks and 3,177 forged bonds still awaiting investigation.

Of the 33,427 check cases investigated, 15,730, or 47.1%, were thefts from the mails involving $1,085,363.17. There were 10,312 income-tax-refund checks investigated, representing 30.8% of all closed check investigations. Next in order were veterans' checks (19.9%) and allotment and allowance checks (16.7%).

There were 1,817 persons arrested for check forgery and 1,676 convictions. Bond forgery arrests totalled 184, and there were 173 convictions. Convictions include dispositions on cases pending from prior years.

Arrests for all offenses aggregated 2,346; convictions, 2,125.

The secret service closed 45,384 criminal cases and 1,735 noncriminal cases for a total of 47,119 investigations completed during the fiscal year. Fines in criminal cases totalled $38,343.45, and jail sentences aggregated about 2,116 years, with additional sentences of 2,333 years suspended or probated.

(U. E. B.)

Securities: *see* Stocks and Bonds.

Securities and Exchange Commission.

Created in 1934, this bipartisan, quasi-judicial agency of the U.S. federal government administers the following statutes in the general field of securities and finance.

Securities Act of 1933.—Congress sought by this law to protect the interests of investors and the public by prohibiting fraud in the sale of securities in interstate commerce and by requiring that, in the public distribution of securities, all pertinent facts be disclosed, so that investors would be able to make a realistic evaluation of the securities' worth and an informed decision whether to acquire them.

To obtain such disclosure, the law requires the issuing company to file with the SEC a registration statement containing the required financial and other information, and the delivery to investors of a prospectus reflecting the salient registration disclosures. During the year ended June 30, 1949, $5,300,000,000 of securities were registered for public sale by 429 companies, increasing to $54,000,000,000 the total of registered securities since 1933.

Registration is neither a warranty of the worth of securities nor a guarantee against loss in their purchase. Instead, its objective is to provide disclosure of the facts upon which investors may protect themselves against imprudent investments or speculations.

Securities Exchange Act of 1934.—This law extends the "disclosure" doctrine of investor protection to securities listed and traded on the securities exchanges throughout the U.S. Through registration of these securities with the commission and the subsequent filing of annual and other periodic reports by the issuing companies (the latter requirement also applies to most Securities act registrants), disclosure is provided of information essential to the investing public's appraisal of the securities' worth. At the end of the year, 3,645 security issues of 2,194 companies were listed on the national exchanges; and during the year, exchange trading therein approximated $11,000,000,000.

Additional protective provisions require disclosure of all pertinent facts in communications to holders of listed securities soliciting their proxies (votes) upon corporate matters, and that officers, directors and 10% stockholders report their holdings of and transactions in all equity securities of listed companies and be accountable to the issuer for their short-term trading profits in such securities (thus tending to curb improper use of "inside" information). During the year, 1,702 proxy solicitations were processed by, and 18,523 ownership and trading reports were filed with, the commission.

The investing public is further protected against abusive practices in the securities markets (both exchange and over-the-counter) by statutory provisions and commission rules designed to establish and maintain just and equitable principles of trade and to curb misrepresentation, market manipulation and other fraudulent securities' violations. Compliance therewith is a prerequisite to the continued conduct of a securities business by the 18 exchanges and 4,000 broker-dealer firms registered with the commission at the year's end, as is true of one registered national association of over-the-counter dealers.

To enforce these measures, the commission is empowered to investigate complaints or other indications of possible securities' violations and to require sworn testimony and the production of books and records pertinent thereto. If a violation is thus discovered, the commission is further authorized: (1) to seek federal court orders enjoining the acts or practices complained of; (2) to refer the facts to the department of justice for criminal prosecution of the offenders; or (3) to suspend or expel persons or firms from membership in exchanges or the over-the-counter association or revoke broker-dealer registrations with the commission. The latter, so-called "administrative" sanction may be imposed only after full opportunity for hearing, and the commission's decision is subject to review by the appropriate U.S. circuit court of appeals. In addition to the many hundreds of civil actions and criminal prosecutions successfully maintained, the commission invoked the administrative sanction in more than 230 cases (with no court reversals) by the close of the year.

Margin trading in securities is subject to regulation under this act by the board of governors of the federal reserve system.

Public Utility Holding Company Act of 1935.—The objective of this law is twofold: (1) regulation of the financial and related affairs of electric and gas public utility holding company systems to protect investors, consumers and the public against abusive practices found by congress to have been prevalent in the creation of huge utility empires during the 1920s; and (2) effectuation of a thoroughgoing readjustment of such systems through an integration process which would limit their operations to a group of interconnected properties in a single area or region (and require divestment of companies and properties not retainable as a part of such system), and a simplification process under which undue complexities in corporate and capital structures would be eliminated and (incidental thereto) voting power redistributed among security holders on a fair and equitable basis.

By the end of 1949 more than 700 nonutility properties had been divested from utility systems; more than 600 utility companies or properties had been divested from integrated systems (although in certain instances they became a part of some other system); and comparable achievements had been obtained in the elimination of complexities and the redistribution of voting rights (such as substitution of all-common-stock capitalizations for multiple security structures; dissolutions of unnecessary and uneconomic companies, and mergers, consolidations and recapitalizations accompanied by a "fair and equitable" redistribution of voting power among security holders in recognition of the equity which each class had in the company's assets and earnings; virtual elimination of huge accumulations of unpaid dividend arrearages on preferred stocks; and substantial debt-to-property ratio reductions).

At the end of the year, 72 holding companies with 570 subsidiaries having aggregate assets of $14,000,000,000 were registered with the commission, reflecting a reduction of 63 companies during the year. Of utility financing, $1,000,000,000 was passed upon by the commission during the year. In contrast with the disclosure requirement of the Securities act, this law prescribes standards with which utility securities must comply before their issuance and sale may be authorized (assuming the issuing company is part of a registered holding company system).

At the end of the year, trust indentures covering $16,800,000,000 of debt securities had been qualified under the Trust Indenture Act of 1939, and 358 investment companies and 1,045 investment advisers were registered under the Investment Company Act of 1940 and the Investment Advisers Act of 1940, respectively. The commission during the year participated in 80 corporate reorganization cases under chapter X of the National Bankruptcy act, serving as independent, expert adviser to federal courts. (*See* also STOCKS AND BONDS.) (O. L. Ds.)

Seeing Eye, The: *see* SOCIETIES AND ASSOCIATIONS.

Seismology. The strongest earthquakes of 1949 were those of July 10 in eastern Turkestan and Aug. 22 off the coast of British Columbia. Both were magnitude 8 on the instrument scale, but damage was limited because of the location. The most disastrous shock of the year, on Aug. 5 in central Ecuador, killed more than 8,000 persons, injured 20,000, and caused property damage of several million dollars. Pacific Northwestern United States experienced the worst earthquake in its recorded history on April 13. The Puget sound cities of Olympia, Tacoma and Seattle were hardest hit. Damage in Washington was estimated to be at least $15,000,000. On April 20 the most severe earthquake in Chile in ten years was reported to have killed 57, injured 89 and caused considerable property damage. Shocks also caused damage in Nevada and California in the United States, in Turkey, Arabia and the Philippine Islands.

Methods to enable study of response characteristics of all electromagnetic seismographs were developed. Electronic equipment developed at the Witwatersrand in South Africa provided radio transmission of seismograms for as much as 10 mi. or more.

Publication of the results of the seismic refraction surveys at Bikini indicated a depth of several thousand feet below the lagoon floor to the igneous basement rock. Seismic reflection surveys in the Atlantic suggested a reflecting horizon at depths ranging from negligible to several thousand feet beneath the ocean floor. Studies of crustal structure based on the records of the Helgoland and Haslach ammunition explosions in 1947 and 1948 were published. Investigations based on instrumentally determined magnitudes of earthquakes indicated that the occurrence of aftershocks may be explained as an elastic afterworking or creep in rocks. Microseisms continued to engage the attention of many seismologists because of their meteorological and oceanographic applications. A relationship between cold fronts and microseism storms was reported by several observers, but others supported the theory of variations of pressure on the sea floor accompanying a low-pressure area as the origin of microseisms. Publication of Beno Gutenberg and C. F. Richter's *Seismicity of the Earth and Associated Phenomena* provided a valuable reference source on the relative seismicity of various parts of the earth.

The U.S. coast and geodetic survey greatly expanded its teleseismic program through development of a rapid communications system. A subcommittee on seismology with headquarters at the Seismological institute of the University of Chile, Santiago, was set up in the Commission on Cartography of the Pan-American Institute of Geography and History. Seventh-day Adventists. The celebration of the centenary of united activity on the part of the religious group which later became the Seventh-day Adventist Church was held on April 9 and 10, 1949. The church at that time numbered 681,363 communicants, who contributed annually more than $42,000,000.

The major administrative problem of 1949 was the reorganization of the mission activities in China, which became necessary because of the Communist victories. A provisional church government, under Chinese church officers, was set up in all Communist-occupied China. American missionaries driven out of the occupied area were sent largely to Japan and also to other parts of the far east and to India. The executive committee appealed to American communicants to increase their Sabbath school offerings to missions by 50%.

Radio evangelism increased; by 1949 it was estimated that three out of four families in the United States could hear the weekly "Voice of Prophecy" program. Danish and Arabic were added to the list of languages for overseas broadcasts. Radio Tangiers broadcasted the program for the equatorial North African area.

The American Temperance society, the church's temperance organization, campaigned vigorously in support of local and state prohibition laws, notably in Oklahoma. The society's paid-up membership in 1949 was more than 56,000.

The autumn council of the executive committee, held at St. Louis, Mo., from Nov. 6 to 16, considered, among other items: the question of government grants to religious institutions; the creation of a school of alcoholic studies; and the establishment of a home for aged workers.

The quadrennial session of the world conference was to be held in San Francisco, Calif., July 10 to 22, 1950.

The *Review and Herald* is the weekly church paper. (*See* also CHURCH MEMBERSHIP.) (F. D. N.)

Seychelles. A British colony in the Indian ocean. Area: 156 sq.mi. Pop. (1947 census): 34,594. Governor: Percy Selwyn Selwyn-Clarke.

History.—During 1949 a court of appeal judgment invalidated legislation passed in Nov. 1948 by an improperly constituted legislative council. Strong exception was taken locally to the nomination to the legislative council by the governor of C. Collet, formerly acting attorney general. During the year a number of cases came before the court for the refund of income tax paid under alleged threats during Collet's attorney generalship. The administration of the colony was debated in the house of commons. Toward the end of the year Collet resigned from the legislative council.

Sherman, Forrest Percival (1896–), U.S. chief of naval operations, was born on Oct. 30 in Merrimack, N.H., studied a year (1913–14) at Massachusetts Institute of Technology, Cambridge, Mass., and entered the U.S. Naval academy, Annapolis, Md., graduating in 1917, second in his class. During World War I he saw duty in European waters, and after that war he became a naval aviator. Early in World War II he served with the war plans division of the office of chief of naval operations and later was given command of the carrier "Wasp," which was sunk by the Japanese in 1942. He then served as chief of staff to Vice-Adm. John H. Towers, commander of the navy's Pacific air forces, and as deputy chief of staff to Adm. Chester W. Nimitz, commander in chief of the Pacific fleet. In Dec. 1945 he was named deputy chief of naval operations and helped draw up the original plans for unification of the armed services. In Jan. 1948 he was named commander of the U.S. naval force patrolling the Mediterranean, and it was from this duty that he was recalled to Washington, Nov. 1, 1949, to become chief of naval operations, succeeding Adm. Louis E. Denfeld.

Shipbuilding. The world tonnage of merchant ships of 1,000 gross tons or more, as of June 30, 1949, was distributed as follows among the principal maritime nations:

	Number of vessels	Gross tonnage		Number of vessels	Gross tonnage
United States*	3,514	25,977,200	Italy	355	2,142,300
British Empire	3,146	18,867,000	Russia	430	1,324,100
Norway	865	4,416,100	Greece	223	1,255,700
Sweden	537	1,792,200	Denmark	299	1,033,300
Netherlands	481	2,683,200	Japan	290	1,144,000
France	475	2,620,500	Other countries	1,697	6,327,800
Panamá	453	2,948,300	Total	12,765	72,531,700

*Excludes vessels on the Great Lakes

The total of 72,531,700 gross tons of vessels in the world fleet represented an increase of 1,947,200 gross tons since June 30, 1948, but the U.S. fleet during the same period decreased by 130 vessels totalling 712,300 tons.

The Shipbuilders Council of America reported, as of Oct. 1, 1949, 925 vessels, each of 1,000 gross tons or more, aggregating 7,081,259 gross tons, under construction in the world.

United States.—At the beginning of 1949, shipbuilding in the private shipyards of the United States consisted of 76 merchant vessels, aggregating 1,187,850 gross tons, and 2 dredges, totalling 24,672 displacement tons. At the end of the year these private shipyards had under construction or on order 39 merchant vessels, aggregating 639,000 gross tons, and one dredge totalling 21,572 displacement tons.

During 1949 the private shipyards of the United States delivered 33 tank vessels, of 1,000 gross tons or more, aggregating 538,051 gross tons, and one 3,100-displacement-ton dredge, as compared with 28 seagoing vessels, totalling 163,486 gross tons, in 1948, and one dredge of 1,100 displacement tons.

Merchant Ships Under Construction in the World, Oct. 1, 1949

	Number of vessels	Gross tonnage
Great Britain	397	3,200,193
Sweden	149	1,078,010
United States	53	900,453
France	72	443,169
Netherlands	59	428,133
Denmark	41	203,563
Italy	26	191,100

THE "VENTURI," designed by Gar Wood and made public in July 1949. According to Wood, the ship's roll was cut to a minimum by the cushioning movement of air through the "wind tunnel" formed by the twin hulls

Contracts for only five seagoing merchant vessels were placed in private shipyards of the United States in 1949. Many of the smaller coastal and inland shipyards, however, had reasonable activity in the construction of barges, towboats and other small craft. The total volume of this work for the first 11 months approximated 62,000 gross tons for nonpropelled craft and 19,000 gross tons for self-propelled units.

As of Sept. 1949, employment in the ship-repairing branch of the industry in about 80 yards had dropped to 25,725 from 56,708 the year before, a decrease of approximately 31,000 or 58%. This substantial reduction in employment resulted from the completion of the reconversion of merchant vessels from wartime requirements back to peacetime requirements, and the decrease in the volume of United States flag shipping in operation. Employment in the shipbuilding branch of the industry, however, was slightly in excess of 29,500, or 4,500 more than prevailed a year before.

The average hourly earnings in the industry for shipbuilding and ship repairing in Sept. 1949 was $1.632. (*See* also Shipping, Merchant Marine.)

(H. G. S.)

Great Britain.—Shipbuilding in the United Kingdom during 1949 was distinguished by a better flow of materials and equipment which permitted greater production than in 1948. A start was made with more of the orders already on the books of the companies. During the closing months of 1948 many contracts had been placed for oil tanker vessels, and these represented a bigger proportion of the tonnage under construction than ever before. Work was still proceeding on some large liners but fresh contracts for ships of this class were unusual. Builders were still awaiting more orders for ordinary cargo, or tramp vessels. Few such ships had been built after the end of World War II.

Experience during the greater part of the year showed that diesel ships and steamships burning oil could still be operated profitably at the lower levels of freight rates, whereas losses would have been incurred in the employment of coal-burning steamships with coal at about £4 a ton in the United Kingdom.

The advantage which ships consuming oil had over steamships was, however, largely lost when, after the devaluation of sterling in terms of dollars in September, oil prices outside the United States were raised by about 40%. There remained, however, the merits which the use of oil had over the burning of coal in cleanliness, speed of bunkering and reduction of labour. Freight rates were too slow to respond to the higher cost of expenditure in dollars in world trades, because of an apparently sufficient supply of the tonnage available for the trade offered.

On March 31, 1949, the proportion of the total tonnage under construction throughout the world which was built in the United Kingdom was 47.7%, making the share of shipyards in other countries 52.3%. On June 30 the share of the United Kingdom was rather less at 46% and that of other countries correspondingly more at 54%. The United Kingdom's share again declined by the end of September—to 45.5%—and the share of yards in other countries rose to 54.5%. The total volume of work in United Kingdom yards after World War II included a substantial amount for owners abroad. At the end of March 1946, about 100,000 tons of such shipping was being built. By March 1949 it had risen to 742,000 tons, and by Sept. 30, 1949, the amount had expanded to 766,000 tons. The shipping under construction on Sept. 30 included 293,000 tons for Norway and 103,000 tons for Argentina.

Better supplies of materials were reflected in the United Kingdom in an increase in the work started, which was pronounced at the end of the third quarter. During the three months ended March 31 work was begun on 73 vessels of 274,000 tons. In the June quarter new work was represented by 64 ships of 288,000 tons, and in the three months ended Sept. 30 work was begun on 80 ships of 402,000 tons.

For the first three quarters of 1949, 250 ships, representing 990,000 tons, were completed in the United Kingdom. For the whole of 1949 shipping delivered was 1,213,000 tons. It was therefore, clear that total output for 1949 would well exceed that for 1948.

Films of 1949.—*Down to the Sea* (British Information Services).

(Ct. M.)

Shipping, Merchant Marine.

On Sept. 30, 1949, there were 1,214 ocean-going merchant vessels of 1,000 gross tons and over, totalling 14,350,000 dead-weight tons, in the active United States merchant marine. This was about 200 less than the number active on Dec. 31, 1948. Of the active vessels, 1,032 were privately owned and 182 government-owned. There were in addition 196 vessels temporarily inactive and 1,974 (excluding some special types) laid up in reserve.

The number of privately owned vessels (active and inactive) had increased by 13 over the number on Dec. 31, 1948. The active privately owned United States merchant marine of 12,452,000 dead-weight tons on Sept. 30, 1949, was only 3,794,000 dead-weight tons larger than the prewar privately owned fleet active on June 30, 1938. The ships of the 1949 fleet, however, were larger, faster and relatively newer.

The number of vessels owned by the government in active service decreased by about 150 from Dec. 31, 1948, to Sept. 30, 1949, while the number laid up in reserve increased by about 130 during the same period. The decline in active government-owned ships was expected to continue until expiration of the maritime commission's authority to charter vessels on June 30, 1950. After that date there would probably be no active government-owned vessels, with the possible exception of a few operating in specialized trades.

U.S. flag vessels carried 46.3% of the total U.S. export and import trade in the first six months of 1949, in contrast to 67.5% in the corresponding period of 1946. Decrease in cargoes shipped under Economic Cooperation administration authorization (50% of which had by law to be carried in U.S. ships) together with increasing competition from merchant marines of other nations whose operating costs were relatively lower, forced the withdrawal of many U.S. flag ships from operation. Vessels in tramp trades, which were not subsidized, were especially vulnerable to foreign competition, and many of these vessels which had been chartered from the government were withdrawn from service. (P. B. F.)

Europe and Asia.—By the end of 1949 many of the heavy war losses of the British and Allied nations, including Norway, had been made good. The British merchant navy had recovered its prewar volume, although the proportions between different sections, mainly passenger and cargo liners, ordinary cargo ships or tramps and oil tankers, had not been re-established.

Passenger liners continued to resume their regular services after reconditioning extending over a year or more following war duties and the return of troops and the carriage of emigrants from Europe to the new countries, notably South Africa and Australia. Some large new liners were commissioned, including the new Orient liner "Orcades," of 28,000 tons and valued at £3,250,000, which completed her maiden voyage from London to Australian ports early in the year. The Cunard White Star liner "Caronia," of over 34,000 tons and valued at more than £4,000,000, was the largest ship built anywhere since the end of World War II.

In the spring the Royal Mail liner "Magdalena," of 17,500 tons and valued at £2,300,000, was commissioned and was wrecked near Rio de Janeiro in April. The "Presidente Perón," first of three ships of about 14,000 tons gross each built in the United Kingdom for the Argentine government, left Southampton on July 20 on her maiden voyage to Buenos Aires. The cost of the vessel exceeded £1,500,000.

On August 25 the liner "Rangitoto," of 22,000 tons gross, owned by the New Zealand Shipping company, left London on her maiden voyage to Wellington, New Zealand. A sister ship, the "Rangitane," was completed at the end of 1949.

The "Himalaya," of 28,000 tons gross, was commissioned by the Peninsular and Oriental Steam Navigation company in Sept. 1949 and sailed from Tilbury on her maiden voyage on Oct. 6. The "Himalaya" was similar in size to the "Orcades." Each vessel was larger and faster than any liner previously built for either company. They were the outcome of a policy of fewer but faster and larger ships which was intended as a means of helping offset the much higher building costs and operational expenses.

The French liner "Ile de France," of 45,000 tons gross, returned to trans-Atlantic service in July 1949 after reconditioning at Saint-Nazaire which occupied more than two years. The internal rebuilding of the ship after strenuous war service cost between six and seven times the original price of the vessel in 1926.

A great increase in shipbuilding costs caused managers much concern. Although insured values were generally raised when World War II broke out, the payments for ships lost only partially met the bills for new ships. Replacement of vessels made necessary by advancing age raised a more acute problem, since the amounts set aside annually for depreciation on much lower valued ships fell far short of the costs of the new vessels. The task of shipping management was further increased by slower working in ports. As an example the ships in a large British fleet on the average formerly spent 28 days in port compared with four weeks at sea, but in 1949 they spent 36 days in port.

Shipping was particularly liable to be affected by decisions of governments which greatly influenced the course of trade. There was much waste of costly refrigerated space in South American liners during the first five months of 1949 because supplies of meat were not forthcoming from Argentina as had been expected. Restrictions on imports to South Africa early in the year, and more drastic curtailments after midsummer, meant a rush to ship cargo in periods immediately preceding the relevant dates and, subsequently, a great falling off in shipments, particularly after the middle of June.

Several countries announced intentions to develop mercantile marines. India contemplated a mercantile marine of 2,000,000 tons gross within the next five or seven years; but a keen protagonist for a large Indian merchant navy had seen difficulties in the way of securing the construction of the ships, of paying for them at the current prices and of obtaining sufficient trade for them when built. The Italian government announced its intention of having a merchant navy by 1952 on almost the 1941 level of tonnage and, of course, a much more up-to-date one. Japanese shipping re-appeared in local services and Poland expressed a desire for a substantial mercantile marine. The occupying powers sanctioned the construction of a number of cargo ships and tankers in Western Germany not exceeding 7,200 tons gross and a speed of 12 knots. By a later agreement Germany was permitted also to build six special ships which might be refrigerated vessels, fruit carriers or oil tankers.

(Ct. M.)

Shoe Industry.

The shoe industry, in 1949, was faced with the problem of adjusting prices to a level where the consuming public would be willing to buy. Consumers continued to shop around cautiously to make certain that their spending dollar would bring the most for the money.

Shoe production, in general, was maintained at almost the same level as in 1948. There were fluctuations in the women's shoe category but only to the extent of shifts from one type of shoe to another. Casual shoes were popular among women because of their comfort and moderate price. Of the estimated 201,000,000 pairs of women's shoes manufactured in 1949, 65,400,000 were casuals.

Men's shoe production remained stable, amounting to an estimated 98,900,000 pairs for 1949 as compared with 104,730,000 pairs in 1948. Juvenile shoe production decreased from the high of 111,194,000 pairs in 1948 to an estimated 104,500,000 pairs for 1949.

Production costs remained high and were reflected in the final cost of the shoe. Devaluation of the British pound sterling and the currencies in other countries came too late in the calendar year to have any appreciable effect on the aggregate cost of making leather. Raw materials provide the bulk of tanners' supplies and, since domestic hides were in short supply, fluctuations in price were negligible.

Shoe manufacturers abroad worked hard to increase their shoe production, with a view to expanding their markets in the United States. English men's shoes always had a good acceptance in the U.S. and the lower prices, as a result of devaluation, were expected to make them more attractive to U.S. purchasers.

Canadian shoe manufacturers were faced with increased production costs as a result of monetary devaluation and gave serious consideration to a price policy that would protect the industry from loss and, at the same time, make Canadian-made shoes available to the public at the lowest possible price, without interfering with standards of quality. (*See* also LEATHER.)

*Preliminary.

Shooting.

Trapshooting.—The 50th Grand American handicap at Vandalia, O., in Aug. 1949 drew more than 2,000 marksmen from the United States, Cuba, Canada and the Canal Zone. The championship went to Pete Donat, a farmer from Antwerp, O., who defeated I. W. Sonderman of Lima, O., 23–21, in a shoot-off after they had tied with 100 straight from the 20-yd. line. Splitting the money prizes, each won about $7,000.

Mrs. Janice Mason of Dallas, Tex., scored 96 out of 100 from 18 yds. to capture the women's Grand American title. Other champions in 1949 included: Rudy Etchen of Los Angeles, Calif., professional; Joe Hiestand of Hillsboro, O., class AA and champion of champions; D. Lee Braun of Dallas, Tex., professional class AA; Mercer Tennille of Shreveport, La., national doubles winner for the third time in four years; Joan Pflueger of North Miami, Fla., women's champion of champions; and Forest McNeir of Houston, Tex., veterans' champion.

In the national amateur championships held at the New York Athletic club's Travers Island traps, Pelham Manor, N.Y., M. D. Clark of Woodbury, Conn., scored a perfect 25 in a shoot-off with C. L. Banks of Nichols, Conn., for the top prize in the distance handicap. Ben Higginson of Newburgh, N.Y., won the 200-target singles; Roger Fawcett of Greenwich, Conn., the doubles; Forest McNeir of Houston, Tex., the veterans'; Mrs. I. Andrews of Spartansburg, S.C., the women's crown; and Richard Baldwin of Danbury, Conn., the junior championship.

Skeet Shooting.—Sgt. Glen Van Buren of Carswell air force base at Fort Worth, Tex., retained his national all-gauge and service titles in the United States skeet tournament at Dallas, Tex. Other major winners were Mrs. Ann Martin, San Antonio, Tex., women's all-gauge; Ben Di Iorio, Jr., Utica, N.Y., sub-small gauge and champion of champions; Mrs. J. A. La-fore, Haverford, Pa., women's sub-small gauge, and D. L. Braun of Dallas, industry all-gauge. Tom Spicola, 3d, of the University of Tampa, won the 1949 national intercollegiate championship.

Rifle Shooting.—The Dewar rifle trophy was retained by the United States and Robert E. McMains of Dallas, Tex., led a big field for the national championship. W. G. Eicke of George Washington university, Washington, D.C., with an all-time record of 290 out of a possible 300 points, took the individual intercollegiate title, the team crown being won by the University of Maryland, Baltimore.

Pistol Shooting.—Sgt. Huelet L. Benner of Fort Knox, Ky., regained the national pistol championship he had won in 1947. The 18th annual international pistol tourney at Teaneck, N.J., drew a crack field. Among the outstanding marksmen was Sgt. T. R. Mitchell of the U.S. marine corps, who shot three perfect 300s in the four-man team, .45-calibre and .28-calibre contests.

(T. V. H.)

Shows, Animal.

Horses.—Greater interest in horse shows, both from exhibitor and audience viewpoints, was shown in 1949. The 11th annual Tennessee Walking Horse National celebration was reported as the largest ever held. The Tennessee state fair was said to have had its best horse show in 20 yr. The American Royal reported steady growth and progress with 850 horses entered from 37 states. The Southwestern Exposition and Fat Stock show had the largest horse show in its 53-yr. history with more than 900 entries.

A slight reduction in the total number of smaller local shows was noted, but the larger shows reported a banner year.

The hunt clubs in the eastern section of the United States also reported a most satisfactory year.

Increased interest in the Shetland pony, Arabian and Appaloosa shows was reported from certain sections. Likewise, the National Golden Horse show was most successful, bringing together a large number of Palominos of various breeds.

Performance classes for stock horses continued to be especially popular. The cutting horse contest at the Southwestern Exposition and Fat Stock show was the largest of its kind ever held. These performance classes for stock horses had become an accepted event in horse shows over a major portion of the United States.

Other prominent events were the shows at San Diego, Calif.; Tulsa, Okla.; Chicago, Ill.; Houston, Tex.; New Orleans, La.; St. Louis, Mo.; Lexington, Ky.; Denver, Colo.; and The Royal Winter fair at Toronto, Ont. (D. W. Ws.; W. M. Wn.)

Livestock.—The 1949 livestock show year reached new high levels in the average quality and quantity of farm animal breeds at nearly all of the major shows and expositions.

The National Western Stock show, held in Denver, Colo., Jan. 14 to 22, 1949, was distinguished for its purebred Hereford cattle, purebred bulls of both the Hereford and Aberdeen-Angus breeds and commercial feeder cattle. It also presented one of the year's best exhibitions of quarter horses and Palominos.

The Southwestern Exposition and Fat Stock show, oldest established stock show in the United States, was held at Ft. Worth, Tex., from Jan. 28 to Feb. 6, in the new Will Rogers Memorial Amphitheatre and adjoining exhibition barns and buildings.

The Wisconsin state fair, held Aug. 20 to 28, 1949, had the largest number of dairy cattle exhibitions of any show in the country. The Illinois, Indiana, Ohio, Iowa and Minnesota state fairs were all notable for their large shows of sheep and swine. A National Barrow show of all the swine breeds, featuring meat yielding animals only, was held in Austin, Minn., Sept. 14 to 17.

SPANIELS being judged at one of the 41 rings of the Morris and Essex outdoor dog show held at Madison, N.J., May 28, 1949

Various sectional livestock shows were held during the year, the first of which was the Eastern States exposition in Springfield, Mass., Sept. 18 to 24. The next was the Ak-Sar-Ben Livestock and Horse show at Omaha, Neb., Sept. 30 to Oct. 9, chiefly a fat stock show. Closely following was the Pacific International Live Stock exposition at Portland, Ore., Oct. 7 to 15, the major show of the northwest.

The dairy breeds and Belgian draught horses are emphasized annually at the National Dairy Cattle Congress and National Belgian Horse show at Waterloo, Ia. It was held Oct. 3 to 9, 1949; and 1949 saw the introduction of a new dairy show at Indianapolis, Ind., the International Dairy exposition, Oct. 8 to 15.

The annual American Royal Live Stock show at Kansas City, Mo., took place Oct. 15 to 22, 1949. It is perennially among the top beef cattle and horse shows of the United States. San Francisco was host to the Grand National Live Stock exposition Oct. 28 to Nov. 6. The largest stock show of the west coast was held in the new Cow Palace at the outskirts of the city.

The country's largest and most famous livestock show, the International Live Stock Exposition and Horse show, held its 50th anniversary show in the International Amphitheatre and adjoining area of the Chicago Union Stock Yards, Nov. 26 to Dec. 3. Held in Chicago at the same time were the National 4-H Club congress and many annual meetings of national livestock and agricultural associations.

The Calgary Exhibition and Stampede was held July 11 to 16; and the third postwar Canadian National exhibition was held in Toronto Aug. 26 to Sept. 10. Canada's major annual show, the Royal Winter fair, was also held in Toronto, Nov. 15 to 23.

The largest show in South America is the Palermo in Buenos Aires, Arg. It was held in Aug. 1949. It presented the world's largest show of Shorthorn cattle, and, to a lesser extent, featured Hereford and Aberdeen-Angus cattle as well as the two leading dairy breeds of the Argentine, Holstein-Friesians and Guernseys.

The 110th show of the Highland and Agricultural Society of Scotland was held June 21 to 24, 1949, at Dundee; and the century-old Royal Agricultural Society of England show was held July 1949 at Shrewsbury. Both are itinerant shows and the longest established of the world's major events of this class.

(W. E. O.)

Dogs.—Exhibition activity in dogs continued at a high level in 1949. The American Kennel club held under its rules 557 championship point shows of which 331 were for all breeds and 226 were specialty or one breed shows. There were approximately 300 informal sanctioned or match shows, most of them for puppies only—dogs under 12 months of age.

The largest dog show was the one-day outdoor show of the Morris and Essex Kennel club, Madison, N.J., 2,257 dogs actually competing. The best dog in the show was Mrs. Constance Winant's imported Scottish terrier Champion Walsing Winning Trick of Edgerstoune. The largest indoor show was the New York city show, at Madison Square Garden, of the Westminster Kennel club, with 2,046 dogs competing. The top winner was Mr. and Mrs. John P. Wagner's boxer Champion Mazelaine's Zazarac Brandy who at the end of the year had amassed a total of 42 wins of best-in-show all breeds for his career and a record in his breed.

Approximately 862 field trials were held during the year, including 327 bird dog trials (setters, pointers, Brittany spaniels); 230 beagle trials (on rabbits); 55 spaniel trials, mostly for springers but also including cockers—land work on pheasants or pigeons and water work on ducks; 60 retriever trials for retriever breeds including Irish water spaniels—land and water work as with springers. Approximately 180 foxhound and coonhound trials were held, as well as 10 greyhound trials (coursing after live rabbits in an enclosure).

The champion field retriever for the year was Paul Bakewell's black Labrador Marvedel Black Gum. The field champion of the year in springers was Davellis Kennel's Davellis Wager.

Among the bird dogs, the pheasant championship was won by Otis Carpenter's pointer Sam's Madison Jake. The quail championship was won by Powel Briscoe's pointer Briscoe's Carolina Doughgirl. The grouse championship was won by the English setter Sam R. Light's Sam L's Skyhigh.

Total 1949 registrations in the chief studbook, that of the American Kennel club, were 241,811, a new record, with the first ten breeds in order as follows: American cocker spaniel, beagle, collie, boxer, Boston terrier, dachshund, Pekingese, Chihuahua, German shepherd dog, Pomeranian.

Silk. The bright prospects for increased consumption of silk in the United States in 1949, based on the great increase in 1948 over the year before, did not materialize. Prices of raw silk were stabilized, and there was apparently little incentive for purchasing, evidenced by the small demand for silk fabrics. However, in June, the U.S. occupation authorities in Japan announced that raw silk transactions would be restored to private trading on and after Jan. 1, 1950. In the expectation that silk prices would advance after that date, exports of raw silk from Japan gained momentum in the last four months of 1949. This trend resulted in a very uneven year of consumption by the U.S. silk manufacturers. The total for the year was 36,551 bales, compared with 59,397 bales in 1948. However, much of this came from stocks already in New York. Actual imports from Japan fell sharply to 29,690 bales, compared with 71,239 bales in 1948.

In November, west Germany completed a trade agreement with Japan for the purchase of $1,800,000 in raw silk and silk fabrics.

In the domestic production of silk fabrics, U.S. mills decreased their yardage in about the same proportion as they did with respect to rayons, most of which were made in the same or similar mills. The total production was estimated to be 17,000,000 linear yards, compared with 19,000,000 yd. in 1948 and 69,000,000 yd. in 1939. In addition to the all-silk fabrics, there were increasing reports of anticipated production of mixed nylon-and-silk fabrics, and it was expected that 1950 would see substantial quantities produced, especially for use in underwear and blouses. Meanwhile, the smaller mills manufacturing silk fabrics in the United States were protesting bitterly over competition with Japanese fabrics. Throughout 1949, protests were filed with U.S. army officials in charge of Japanese affairs, with congressional representatives and with the U.S. tariff commission, culminating in the announcement by the tariff commission at the close of the year that a preliminary investigation would be undertaken to determine whether there was justification for an increased rate of duty on silk fabrics to protect the domestic industry.

Of a total of 31,300,000 yd. of all-silk fabrics imported by the U.S. in 1949 from January through November, 29,400,000 yd. came from Japan. The average price per yard was 54 cents from all countries, and 52 cents from Japan. These were all finished fabrics, ready for manufacture into garments or accessories. In November, U.S. silk fabrics, unfinished, were being sold at 97½ cents to $1 a yard. To this would have to be added finishing costs. By the close of the year, prices on Japanese goods were declining to such an extent that officials of S.C.A.P. (Supreme Commander for the Allied Powers) reminded Japanese merchants that if prices went below $5.50 per pound, U.S. tariff rates would be 55% instead of 25%.

Despite these adverse situations, 1949 saw progress in international co-operation in the furtherance of the use of silk. In March, representing the International Silk bureau (later in the year renamed the International Silk association), Aristide Potton of Lyon, Fr., visited Japan for the purpose of asking financial support from Japanese raw silk producers, through U.S. occupation officials, for the promotion of silk throughout the world. A levy of five cents per pound was suggested. The occupation officials, however, as well as Japanese raw silk producers, opposed the suggestion on the grounds that the Japanese economy made collection of such a levy impossible, and that it would have the same effect as raising the price of raw silk, which would counteract against increased use of silk.

Late in May, at Zurich, Switz., 16 countries, including Japan, were represented at the organization meeting of the International Silk association, and plans were made for holding the second International Silk congress in New York city in Oct. 1950. In addition to the United States, represented by 15 delegates, the representatives came from Austria, Belgium, Egypt, France, Germany, Great Britain, the Netherlands, Hungary, Italy, Iran, Japan, Spain, Switzerland, Syria and Turkey. Table II.—*Silver Industry in the United States*

(In thousands of fine ounces or of dollars)

	1943	1944	1945	1946	1947	1948
Mine production . .	41,461	34,474	29,024	22,914	35,824	38,096
Imports	$27,903	$23,373	$27,278	$57,578	$68,140	$70,884
Exports	$30,687	$126,915	$90,937	$36,455	$30,649	$12,400
Industrial use. . . .	162,113	176,289	184,661	123,647	126,366	129,186
Secondary recovery .	44,113	56,189	58,361	36,647	27,866	23,897
Net consumption. . .	118,000	120,100	126,300	87,000	98,500	105,289

The countries listed account for about 85% of the total; although there are a large number of minor producers, the U.S.S.R. being the most important of these.

United States.—The salient features of the silver industry in the United States are shown in Table II, as reported by the U.S. bureau of mines.

The improvement in output that was manifested in 1948 was not sustained in 1949, as the total mine output for the first three quarters of 1949 was only 26,829,754 oz.

Canada.—Mine output of silver rose from 12,504,018 oz. in 1947 to 14,569,280 oz. in 1948, and to 11,116,642 oz. through Aug. 1949, against 10,780,518 oz. in the same period of 1948. (*See* also MINERAL AND METAL PRODUCTION AND PRICES.)

Skiing.

Members of a French national team made a near sweep of honors in the North American championships held in 1949 at Aspen, Colo. After Jean Pazzi had captured the downhill race on opening day, Georges Panisset won the slalom to defeat Pazzi for the combined crown. Defending champion Jack Reddish of Salt Lake City, Utah, finished third in the downhill and fourth in the slalom to place third in scoring for the combined championship.

Mrs. Rhoda Wurtele Eaves of Montreal prevented a sweep by the French visitors by winning the women's downhill race. However, combined honours were carried home by Mrs. Lucienne Couttet Schmidt, only feminine member of the French team, when she won the slalom after being second to Mrs. Eaves in the downhill dash.

At Salt Lake City, Petter Hugsted, 1948 Olympic champion from Norway, soared to the class A title with leaps of 262 and 263 ft. Second to Hugsted, who represented the Norge Ski club of Chicago, was Art Devlin of Lake Placid, N.Y., who made jumps of 257 and 264 ft. Hugsted was awarded 237 points and Devlin 233.8. George Thrane, a Norwegian exchange student at Washington State college, tallied 230.8; Sverre Kongsgaard, Norwegian student at the University of Idaho, 229.2, and Art Tokle of the Norway Ski club and 1948 winner, 227.6.

Bill Olson of Eau Claire, Wis., with jumps of 244 and 245 ft., captured the class B crown and Marvin Crawford of Steamboat Springs, Colo., placed first in class C after leaping 221 and 226 ft. Howard Jansen of Chicago took the veterans' title.

The national downhill-slalom contests at Big Mountain, Mont., drew a big field of stars, with George Macomber, 21-year-old amateur from West Newtown, Mass., taking the combined laurels with 253 points as a result of a win in the slalom and second place in the downhill contest. Barney McLean of Denver, Colo., was runner-up in the combined scoring with 249 points. The U.S. open downhill championship went to Yves Latreille, 25-year-old Canadian, representing the Sun Valley (Idaho) Ski club.

The big prize for women contestants was taken by Miss Andrea Mead of Rutland, Vt., who took firsts in the downhill and slalom for a combined score of 191 points, four more than her closest rival, Mrs. Rhona Wurtele Gillis of Whitefish, Mont.

Other national title winners in 1949 were Hans Holaas of Modesto, Calif., cross-country; Ralph Townsend, New Hampshire, combined cross-country and jump; Dave Lawrence, Dartmouth college, giant slalom, and Miss Katy Rudolph, Sun Valley, women's giant slalom.

Dartmouth and Middlebury proved outstanding in intercollegiate circles. Numbered among Dartmouth's feats were triumphs in its own and the McGill University Winter carnival. Middlebury won its own carnival after annexing the national college tests at Aspen, Colo. Crosby Perry-Smith of Western State college took both the cross-country and jumping titles, but his team placed second for the meet, scoring 392.22 points as against 394.47 for Middlebury. (T. V. H.)

Smithsonian Institution.

This institution, located on the Mall in Washington, D.C., was established in 1846 through a bequest from James Smithson, an English scientist. Its purpose is "the increase and diffusion of knowledge among men"; this is carried out by means of scientific researches and explorations, publications and museum and art gallery exhibits. The institution is governed by a board of regents, composed of the vice-president of the United States, the chief justice, three senators, three representatives and six citizens from various parts of the country. The executive officer is the secretary, who in 1949 was Alexander Wetmore. The institution has 10 branches: United States National museum, National Gallery of Art, National Collection of Fine Arts, Freer Gallery of Art, Bureau of American Ethnology, International Exchange service, National Zoological park, Astrophysical observatory, National Air museum and Canal Zone biological area.

Fundamental researches were carried on during 1949 by the institution and its branches, chiefly in the sciences of biology, geology, anthropology and astrophysics. Field expeditions were sent out to many parts of the world in the furtherance of these investigations.

Accessions to the National museum during the year totalled 461,000 specimens, bringing the number of catalogue entries to 31,679,046. Museum field expeditions visited Arnhem Land in Australia, India and Nepal, New Zealand, the Persian gulf, several countries of South and Central America and many states in the United States.

The Bureau of American Ethnology conducted archaeological field work in Panamá and in the Canadian arctic. Its ethnologists worked among the Abnaki Indians of Maine and the Iroquois of New York state. The River Basin surveys, a unit of the bureau, was making a reconnaissance of the Indian sites that were to be flooded by dam construction in numerous river basins of the United States. Of the 2,000 such sites already located, about 450 had been selected for excavation before the valuable archaeological material in them was lost forever. The Institute of Social Anthropology, another unit of the bureau, continued its teaching and field work in co-operation with local organizations in Brazil, Mexico, Colombia and Peru.

The Smithsonian Astrophysical observatory continued its daily measurements of the sun's radiation at its two solar observing stations on Mount Montezuma, Chile, and Table mountain, California. A third station was to be built on Clark mountain, California, as soon as funds were available. In the observatory's division of radiation and organisms, laboratories and apparatus were being prepared for special studies in the fields of photosynthesis and cell growth.

The National Gallery of Art added 1,174 art works to its collections; visitors to the gallery numbered 1,529,568. The National Collection of Fine Arts acquired a number of valuable paintings, and the Freer Gallery of Art added to its collections choice specimens of oriental art, chiefly Chinese, Arabic, Syrian, Indian, Persian and Turkish. The Freer gallery conducted extensive researches on objects in its unique collection.

The National Air museum acquired the "Swoose," the B-17 bomber that served in the Pacific throughout World War II, Maj. Alford Williams' "Gulfhawk II" and a Japanese baka bomb, or suicide plane, among its 122 accessions.

The International Exchange service handled 840,125 packages of scientific and governmental publications in the official exchange of such material with the rest of the world.

The National Zoological park had a record attendance of 3,346,000 visitors. The animal collection at the end of the year stood at 3,724 mammals, birds and reptiles, representing 755 species.

Among the 71 publications issued during 1949 were two volumes in the series of *Life Histories of North American Birds* by A. C. Bent, and a revised edition of the *National Aircraft Collection Handbook*. (A. Wt.)

Snyder, John Wesley

(1896–), U.S. government official, was born on June 21 in Jonesboro, Ark., attended Vanderbilt university, Nashville, Tenn. (1914–15), joined the army in 1917, and after World War I entered the banking business in Arkansas and Missouri. In 1930 he joined the field service of the comptroller of the currency of the U.S. and served with this office until 1937, when he became head of the St. Louis, Mo., agency of the Reconstruction Finance corporation. During World War II, he helped organize the Defense Plant corporation, an RFC subsidiary, and as its operational vice-president and director administered the agency's commitments of more than $10,000,000,000 to finance war plants. From Jan. 1943 to April 1945, he was vice-president of the First National bank of St. Louis, when he became federal loan administrator. On July 17, 1945, he was appointed director of the Office of War Mobilization and Reconversion. On June 25, 1946, Pres. Harry S. Truman appointed him secretary of the treasury.

In Feb. 1949, in spite of falling prices and what proved to be a brief business recession, Secretary Snyder called for increased taxes, warning of "serious consequences" otherwise. On July 1 he reported that the government had ended its fiscal year 1949 with a budget deficit of $1,800,000,000. Throughout the summer Snyder was active as a U.S. representative in U.S.-British discussions on Britain's dollar crisis. In July he conferred with British government officials in London, and in September, he was chairman of a U.S.-Canadian-British conference in Washington, D.C., on the sterling area's dollar shortage. The devaluation of the British pound was announced soon after.

Soccer.

Interest in soccer in the U.S. during 1949 was stimulated by the visit of teams from other countries, including the Belfast Celtics of Ireland, the Scottish national team, the Newcastle United, the Kamraterna club of Sweden and the Milano 11 of Italy. Newcastle won ten victories in ten starts and Milano was undefeated in six contests. A highlight of the year was the 2–0 triumph of Belfast over the Scots at Randalls Island, N.Y.

The National Challenge cup of the U.S. Soccer Football association was won by the Morgan club of Pittsburgh, Pa., which beat the Philadelphia Nationals 4–3 in the final. The Philadelphia Nationals took the American Soccer league title after a three-way deadlock and also won the Lewis cup. In the final for the National Amateur Challenge cup, Elizabeth, N.J., defeated Zenthoefer of St. Louis, Mo.

SCOTLAND v. ST. LOUIS, in the first of seven exhibition matches played against U.S. soccer teams by a visiting Scottish team in 1949. They defeated St. Louis 6 to 0

Penn State scored 14 victories in 14 games but was held to a 2–2 deadlock by the University of San Francisco in the first Soccer Bowl contest, played at St. Louis, Mo., on Jan. 1, 1950.

Films of 1949.—*Soccer: The Universal Game* (Hollywood—Pan-American Films). (T. V. H.)

Socialism.

The Socialist movement in 1949 gave its primary energies to the mobilization of its forces against both Communist and fascistic attacks on democratic institutions and to the implementation of measures of social reform and social reconstruction.

In the field of international organization, the Committee for International Socialist Conferences, (Comisco), held several meetings during the year. At its late December meeting in London, it denounced the Cominform for "openly fomenting war throughout one-half of the world," and, in all countries except Russia, for treating "national feeling as a criminal heresy." "But for the Russian veto," it maintained, "a disarmed world could now possess an international police force and all atomic developments including the bomb could be under international ownership and control." Internationally, Socialists also served prominently in the councils of the United Nations and in the formation of the International Confederation of Free Trade Unions.

The most important labour or democratic socialist government was still that of Great Britain. The British Labour government, passed legislation during the year for the nationalization of the iron and steel industry, to become effective in Jan. 1951, after the 1950 election.

The Labour party spent much time and thought during the year in preparing for the 1950 election. In its declaration, "Labour Believes in Britain," it declared that production was "higher and unemployment lower than ever before in peacetime"; that the people were healthier, and that Labour during its four years in office had provided housing for 750,000 people. It tentatively proposed in the next five-year period to nationalize water supply, minerals, meat wholesaling and cold storage, sugar-beet production and sugar refining. It hoped to encourage decentralization in the nationalized industries and to develop more "drive, public spirit and scope for individuality from bottom to top," better labour-management relations within the nationalized industries, and a greater voice for the consumer. The party lost many seats in the municipal elections, but retained all Labour seats in by-elections.

On the continent, Norwegian Labour increased its parliamentary representation, as a result of the October elections, from 76 to 85 out of 150 seats, with the Conservatives coming next with 23 seats. The Communists lost their entire representation of 11. Following the elections, Labour Premier Einar Gerhardsen again formed an all-Socialist government, and declared that it would carry out its pledge to investigate the desirability of nationalizing banks and insurance companies, but in no case nationalize these services until after the 1953 elections. The government made progress in the development of its hydroelectric, chemical, aluminum, electrosteel and other plants, enacted a law providing for free dental care for children between 6 and 14, and reported a production nearly 50% greater than in the late '30s.

In Denmark, Sweden and Finland, the Social Democrats remained in control of their respective countries. In Finland, the Social Democratic government was under constant pressure to concede important cabinet posts to the Communist party, and was frequently denounced by Russian Communists for their co-operation with the western countries. In August, the strikes staged by Communists were characterized by Socialists as attempts to lead "Finland down the same road as that taken by Czechoslovakia." Several Communist unions, following the settlement of the strike, were expelled from the Finnish Federation of Labour.

Socialists in Belgium helped precipitate a new election following the controversy with the Christian Social party over King Leopold III's return. As a result of the year's election, in which the Socialist party opposed the king's return, Socialists returned 66 representatives to the lower chamber, as contrasted with 69 in 1947, and 33 representatives in the upper chamber. The Christian Social party won 105 seats, and formed a cabinet which the Socialists refused to join for the first time, with the exception of a few months, in the previous decade.

In the Netherlands, Labour Prime Minister Willem Drees presided over a coalition cabinet composed chiefly of Labour and the Catholic party and gave much attention throughout the year to the task of providing a status of independence to Indonesia.

In France, the Socialists, with a parliamentary representation of 104 out of 619, remained in uneasy alliance with other parts in a coalition government during the year. At the beginning of the year, the Socialist party was represented in the Queuille government by five members. The party convention in July, critical of the government's domestic and foreign policies, declared that their members should remain in the cabinet only if the law freezing wages were rescinded, the educational program strengthened, nationalization measures defended, mass purchasing power increased, and a more liberal policy in Indo-China and Madagascar undertaken. In October, when the finance minister refused the Socialist demand to give a temporary bonus to workers pending wage adjustments, the Socialist ministers resigned, and the Queuille cabinet fell on Oct. 5. After several weeks, on the organization of the Bidault cabinet, Socialists again entered the coalition government, following agreement on a compromise program.

In Italy the Socialists remained divided during the year. The Saragat or so-called right wing of the movement was represented in the De Gasperi cabinet early in the year, but on Oct. 31 the Socialist cabinet members withdrew over differences regarding wage policies and the failure of the government to carry out adequate social and land reforms.

In Germany, Social Democrats under the leadership of Kurt Schumacher, took an active part in the formation of the western German government at Bonn. In the first electoral campaign, Socialists urged socialization of the major industries, credit and banking institutions and insurance companies, land reform, greater equality in financial burdens, a better distribution of refugees, an expanded housing program, an international authority for the Ruhr, and the incorporation of Berlin into the German federal state. In the Aug. 14 elections, the Social Democrats received 29.4% of the votes (6,932,274), and won 131 seats. The Christian Democrats secured 31% (7,357,579), winning 139 seats, and the Communists, 1,360,443, obtaining 15 seats out of a total of 402. Social Democrats refused to enter the coalition government.

In the Austrian parliamentary elections of October, Socialists took second place, winning 67 seats (40% of the total), as compared with 76 in the preceding elections. The largest representation was won by the People's party—77, a drop from 85. The Communists, who campaigned with a small dissident group from the Socialist party, increased their representation from four to five. A new pro-nazi party—the Independent party—won 16 seats. Socialists again joined the coalition government, and Adolf Schaerf, Socialist, became vice-chancellor.

In the Israeli election of representatives to the constituent assembly on Jan. 25, 1949, the Mapai party (Palestine Labour party), moderately socialist in its ideology, won 46 out of 120 seats, and the Mapam (United Labour party), a more radical socialist movement, obtained 19 seats. David Ben-Gurion, a leader of the Mapai, became prime minister, and Chaim Weizmann, president. The Communists elected four representatives.

Socialists suffered defeats in both New Zealand and Australia in 1949. In New Zealand's elections of Nov. 30, the Labour party, in office since 1935, won only 38 out of 80 seats in parliament, a loss of 4, while the National party won 42.

The Australia Labour party, after eight years in office, lost control of parliament in the elections of Dec. 10, electing only 47 representatives in the lower chamber out of 121 as compared with 43 in the 1947 elections out of 75 seats. The party, however, secured the largest vote (1,810,918 to the Liberal party's 1,522,861—46% of the total). A Liberal and Country party coalition was formed; the Labour party, however, kept control of the senate. The new government pledged itself to preserve and extend the social services, although ending a number of the government war controls.

In Japan likewise, the Social Democratic party lost ground, electing only 49 to the diet, out of a total of 466, as compared with nearly three times that number in 1947.

In India, the Socialist party ran numerous candidates in opposition to the Congress party, conducted great demonstrations and made gains in many municipalities.

In Canada, the Coöperative Commonwealth Federation elected 13 representatives out of a total of 262 in the parliamentary elections, a drop from 32. The popular vote, however, remained about the same as in 1946. The C.C.F. government of Saskatchewan, Can., under the leadership of T. C. Douglas, was returned, although with a reduced majority.

In the United States, Socialist mayors were returned to office in South Norwalk and Bridgeport, Conn. Unity negotiations with the Social Democratic federation continued. The party conducted widespread discussions as to whether the party should not seek to function primarily as an educational Socialist organization.

In Latin America, the Socialist movement had an up-hill battle against the dictatorships of many of the Latin American countries. In many instances, their propaganda and electoral activities were strictly limited. (*See* also COMMUNISM; POLIT-

ICAL PARTIES, BRITISH.) (H. W. L.; N. T.)

Socialist Soviet Republics: *see* UNION OF SOVIET SOCIALIST REPUBLICS.

Socialized Medicine: *see* HOSPITALS; PUBLIC HEALTH SERVICES.

Social Security.

The impetus toward rebuilding or strengthening social security programs continued to be evident during 1949. A few countries adopted their first social security programs. Several others issued plans or enacted measures to strengthen their existing systems through co-ordination and unification. There was also a marked increase in negotiations among various countries relative to reciprocity in social security benefits. These negotiations were taking place on a bilateral and regional basis and, in some instances, between countries of different continents. The postwar demand for technical consultations on legislative provisions and administrative problems was intensified. With the virtual completion of its organizational phase, the United Nations shifted its emphasis to the development of programs and services and to technical assistance on social security problems through international, regional and national organizations.

United States.—The year 1949 was marked by record outlays for social insurance benefits and for public assistance. Some of the increase was attributable to the growth in population and number of persons in the labour force and to a rise in unemployment. Part reflected larger expenditure of federal funds for assistance programs, and part represented the normal growth in insurance programs, pre-eminently federal old-age and survivors insurance. The year also registered progress in health and welfare programs providing services rather than individual payments. Services for mothers and children were strengthened and extended to new areas, and new programs for infants and children with special needs were initiated.

Amendments to the Social Security act that became effective in the latter part of 1948 accounted in part for increases that occurred during 1949 in assistance payments as well as in number of persons aided under the programs for needy aged and dependent children. Most states increased payments, although frequently the additional amount was not sufficient to close the gap between payments and living costs. For the country as a whole, the average monthly payment for old-age assistance and aid to the blind was $5 higher in June 1949 than in the previous June, and the average per child receiving aid to dependent children was about $3 higher. Individual states made increases in varying amounts. A few used part of the additional funds to add to the rolls persons eligible for but not receiving assistance. If additional federal funds had not become available, some states would have found it necessary to restrict the scope of the program or reduce payments. The rise in unemployment that began late in 1948 had its most immediate effect on the general assistance programs, financed by states, or states and localities, without federal participation.

Though no social security legislation was enacted by congress, the house committee on ways and means held extensive hearings on needed changes in the programs operating under the Social Security act—the largest segment of the whole social security program in terms of numbers of persons actually or potentially affected. Early in the year the Commission on Organization of the Executive Branch of the Government (the so-called Hoover commission) released its recommendations relating to social security. The need to expand and strengthen social insurance provisions to meet the needs of all groups of the population was also underscored by intensified pressure during the year for various types of health and disability insurance under union-management contracts.

Social Insurance and Related Programs.—Two of the programs under the Social Security act were designed to compensate for some of the income loss resulting when a wage earner reaches retirement age or dies (old-age and survivors insurance) or becomes unemployed through no fault of his own (unemployment insurance).

Federal old-age and survivors insurance covers, in general, workers in industry and commerce. It is financed through contributions of the wage earner and his employer, based on the worker's wages from covered employment. The benefits are also geared to his average taxable earnings. In Nov. 1949, monthly benefits totalling $55,319,000 were paid to more than 2,710,000 persons. More than three-fifths of the beneficiaries were retired workers, their aged wives and dependent children; the rest were widows, children and aged dependent parents of deceased insured workers.

Similar payments were made during the month under other insurance or related programs. Monthly retirement, disability and survivor benefits went to beneficiaries under the railroad retirement program (367,100), veterans programs (3,305,800), and the federal civil-service system (161,600). Retirement and disability pensions went to some 230,000 employees under state and local government plans and to the survivors of about 38,000 such employees who had died.

The disability payments mentioned above were the only public provisions for compensating wage loss caused by permanent disability not work-connected. For temporary disability of non-work-connected origin, public provisions were limited to the temporary disability insurance systems in effect in a few states and in the railroad industry. Rhode Island, California and New Jersey made payments in 1949 to workers covered by the state unemployment insurance law whose unemployment was caused by temporary disability. New York enacted a temporary disability law, with benefits to begin July 1, 1950. Washington enacted a similar law, but the effective date was suspended pending the outcome of a referendum in Nov. 1950.

For work-connected disabilities—accounting for only about 5% of all disabling illnesses and injuries—federal and state workmen's compensation provisions were in effect.

Unemployment insurance under the Social Security act is a state-federal program covering the same type of employment as federal old-age and survivors insurance. The benefits are financed by employer contributions but the federal government bears the cost incurred by each state in administering its program. Benefits are paid to an unemployed worker who qualifies on the basis of his previous employment and for whom suitable job openings cannot be found. The amount of the weekly payment and the length of time the worker can draw benefits are determined by the provisions of the state law. In Nov. 1949 a weekly average of 1,698,000 unemployed workers drew benefits, and the amount disbursed for the month by the state systems totalled $152,170,000.

Protection against wage loss from unemployment was also available to railroad employees under the Railroad Unemployment Insurance act. In November, about $16,840,000 was paid to an average of 219,100 workers (average number in a 14-day period). Throughout the first half of the year, special reconversion benefits for unemployment were also paid to veterans under the Servicemen's Readjustment act, but those provisions expired in July.

Assistance and Welfare.—In Nov. 1949, almost 2,716,000 persons aged 65 or over were receiving old-age assistance, at an average payment of $44.50 during the month. More than 1,486,000 children in 585,400 families were receiving aid to dependent children; the average payment was $29.12 per child and

$73.93 per family. About 92,200 blind persons received assistance, at an average payment of $46.

The figures on average payments applied to the country as a whole. Averages by state would show wide differences reflecting both the ability of states and localities to finance assistance and the standards prevailing in the state. Moreover, since coverage under the insurance programs excluded agricultural labor, the predominantly agricultural states had more assistance recipients in relation to total state population than did the highly industrialized states.

Other needy persons who could not qualify under one of these special assistance programs were cared for by general assistance, financed without federal participation. In November, general assistance payments went to 543,000 cases, at an average payment of $50.57 per case. Since a case might represent a single individual or several persons in a family, the total number of individuals receiving general assistance was considerably larger than the number of cases.

The aggregate amount expended in the month for assistance in all four programs from all sources—federal, state and local—was $195,806,000.

The Social Security act also provided federal grants to states to help them extend and improve state and community services for mothers and children. Of the annual total of $22,000,000 authorized for federal grants, certain portions of which must be matched by states, $11,000,000 was for maternal and child health services, $7,500,000 for services for crippled children and $3,500,000 for child welfare services. (*See* also RELIEF.)

(A. J. A.)

Canada.—The federal government spent $688,900,000 (about one-third of its total revenue) on social services during the 1948–49 fiscal year, of which the bulk was administered by the department of health and welfare ($356,800,000) and the department of veterans' affairs ($251,600,000). By June 1949 total family allowances payments passed the $1,000,000,000 mark, with 5,000,000 children having benefited. At that time the average monthly payment per family ran at $13.93 for 1,787,622 families. Amendments to the Family Allowances act lowered from three years to one year the residence qualification, and removed the decreasing scale originally provided in the allowance paid to more than four children.

The number of old-age pensioners increased from 235,947 in June 1948 to 251,865 in March 1949. The federal Old Age Pensions act was revised to increase the federal contribution from $30 to $40 per pensioner. The number of blind pensioners increased from 8,842 in June 1948 to 9,567 in March 1949. The federal old age and blind pensions legislation was extended to Newfoundland, where the lowering of the eligible age from 75 to 70 years raised the number of pensioners from 3,000 to 10,000.

Unemployment insurance claims in Oct. 1949 stood at 83,525, which was about 100% greater than for Oct. 1948. For the year ending March 1949 the Ontario workmen's compensation board paid out more than $23,710,000, and the provincial government named a royal commission to report on activities. The Saskatchewan government established an unmarried parents division in its child welfare branch. (C. Cy.)

Great Britain.—The national insurance schemes, including that replacing the former workmen's compensation scheme, came into operation on July 5, 1948, and there was no further legislation on the subject in 1949. Like many modern statutes the implementation of the two acts required the making of a large number of regulations by the minister of national insurance. During the year there were some amendments to these regulations.

In the first 12 months of the operation of the new scheme, 10,000,000 claims, involving 40,000,000 separate payments were dealt with at the 987 local offices of the ministry of national insurance. The death grant payable under the act, which was a cash payment varying in amount up to a maximum of £20, to help to meet the expenses connected with the death of an insured person, did not take effect until July 5, 1949. Seven million new claims to sickness benefit were made in the year, about half of which included claims for dependents. Under the former national insurance schemes no payments were made for dependents. There were 800,000 maternity benefit claims. At the end of the period July 5, 1948–July 5, 1949, 4,150,000 men over 65 and women over 60 were receiving national insurance retirement or old-age pensions. About two-thirds of all insured men reaching 65, and about one-half of all insured women reaching 60 after July 5, 1948, continued in regular employment and accordingly qualified for the increments for postponed retirement that would be added to their retirement pension when they eventually did retire and claim the pension. These increments were in effect 1*s.* (2*s.* for married couples) for every six months of postponed retirement and could increase the joint pension of a man and a wife over 60 by 20*s.* to 62*s.* a week.

Four hundred and sixty thousand widows under 60 were receiving widows' benefits. A new arrangement was brought into force during 1949 whereby anyone notifying the death of a married man received from the registrar of deaths a simple leaflet giving details of the national insurance death grant and widows' benefits. In addition to the widows' benefits, guardians' allowances or orphans' pensions were being paid to 10,000 children. Industrial injuries insurance formed another big section of the scheme.

About 750,000 claims were made to industrial injuries benefits during the first year.

In Sept. 1949 changes were made in the application of the main insurance scheme to persons who were being maintained free of charge in a hospital under the national health service scheme or by the ministry of pensions. No reduction of benefit was made normally during the first eight weeks in the hospital, but after that period the benefit was reduced by 5*s.* a week if the patient could be treated as having a dependent, or otherwise by 10*s.* a week. After a year in the hospital no more than 5*s.* was normally payable directly to a person in the hospital unless he was under treatment for respiratory tuberculosis, in which case 10*s.* was payable. The exception related to certain circumstances where the person had a dependent.

The foreign ministers of Belgium, France, Luxembourg, the Netherlands and the United Kingdom signed two important conventions representing a new stage in their collaboration in social matters concerning the five. The first convention, which was closely linked with the network of bilateral agreements on social security already negotiated or in course of negotiations, enabled nationals or those countries to take advantage of any of these bilateral agreements, no matter in which of the five countries they were residing or had resided. The benefits covered by these agreements included benefits provided in case of sickness, invalidity, old age, death, maternity, industrial injuries and prescribed occupational diseases. The second convention was based on the principle that, if a national of any of the five countries, when resident in the territory of any of the other four, required social or medical assistance but was without sufficient resources, he would receive such assistance from the latter country on the same basis as its own nationals.

FILMS OF 1949.—*Charley's March of Time* (British Information Services); *Life With Grandpa* (March of Time, Forum Edition).

(JN. M.)

Social Service: *see* CHILD WELFARE; RELIEF; SOCIAL SECURITY.

Societies and Associations. The following is a selected list of U.S. societies and associations, with date of founding, membership, officers and chief activities during 1949. (*See* also the separate articles on Boy Scouts; Red Cross; Veterans' Organizations; etc.)

Alcoholic Foundation, Inc. (Alcoholics Anonymous).—This organization was founded in 1938 to help the sick alcoholic recover, if he wishes. Membership in 1949 was given as 80,000. Activities generally include mutual aid among persons who have recovered, or are seeking to recover, from alcoholism. Publication: *Alcoholics Anonymous.* Headquarters: P.O. Box 459, New York 17, N.Y.

American Academy of Arts and Letters.—Founded in 1904 to further literature and the arts, the academy and its parent body, the National Institute of Arts and Letters, in 1949 awarded medals and 15 arts and letters grants of $1,000 each, besides holding an exhibition of works by newly elected members and recipients of honours. Membership numbered 50; the publication is a *Yearbook.* Officers (1949–50): Paul Manship, president; Mark Van Doren, secretary; Chauncey Brewster Tinker, chancellor; Deems Taylor, treasurer. Headquarters: 633 W. 155th St., New York 32, N.Y.

American Academy of Political and Social Science.—Founded in 1889, this organization had 15,000 members in 1949 among business and professional persons seriously interested in the discussion of public questions. Activities during the year included the 53d annual meeting, during which the discussion topic was: "World Government: Why? When? How?" Publication: *Annals,* bimonthly. Officers (1949): Ernest Minor Patterson, president; J. P. Lichtenberger, secretary; Charles J. Rhoads, treasurer. Headquarters: 3817 Spruce St., Philadelphia 4, Pa.

American Association for the Advancement of Science.—Founded in 1848 and incorporated in 1872, this nonprofit association aims to further the work of scientists, to make science more effective in advancing human welfare and to increase public understanding of science. Membership in 1949 was about 45,000 in 76 countries. Endowment in 1949 was about $500,000. Publications: *Science,* a weekly journal; *The Scientific Monthly;* and symposium volumes based on programs presented at its meetings. The annual convention was held in New York, N.Y., Dec. 26–31, 1949. Officers (1949): E. C. Stakman, president; Howard A. Meyerhoff, administrative secretary. Headquarters: 1515 Massachusetts Ave. N.W., Washington 5, D.C.

American Association of Law Libraries.—Established in 1906 to develop and increase the usefulness of law libraries, this nonprofit corporation had in 1949 a membership of about 500. Publications: *Index to Legal Periodicals; Law Library Journal.* Funds are received from dues and subscriptions to the publications. Officers (1949): Helen Newman, Library of the Supreme Court of the U.S., Washington, D.C., president; Margaret E. Coonan, Railroad Retirement board, 844 Rush St., Chicago, Ill., secretary.

American Association of University Professors.—Founded in 1915, the association seeks to bring about more effective co-operation among its members, to create means for the authoritative expression of the public opinions of the body of its membership and to make collective action possible. Its membership on Sept. 1, 1949, was 35,565, and activities included an annual meeting devoted to its general aims. Publication: *Bulletin* (quarterly). Officers (1949): Ralph H. Lutz, Stanford university, president; Ralph E. Himstead, general secretary. Headquarters: 1101 Connecticut Ave. N.W., Washington 6, D.C.

American Association of University Women.—Founded in 1881 to unite alumnae of different institutions for the maintenance of high standards of education, the association in 1949 numbered 108,165 members. The 1949 activities included study and public education in the fields of educational international relations, the status of women and the arts. Publications: *Journal* (quarterly); *General Director's Letter* (triennially); handbooks, study guides and bibliographies. Fellowship endowments amounted to $1,041,664.76. Officers (1949): Althea K. Hottel, University of Pennsylvania, president; Kathryn McHale, general director. Headquarters: 1634 I St., N.W., Washington 6, D.C.

American Bankers Association.—Founded in 1875 to promote the general welfare and usefulness of banks and financial institutions, this association in 1949 had a membership of more than 16,400 banks and banking offices, representing 97.6% of the U.S. banks and more than 99% of its banking resources. Activities included educational programs, especially the American Institute of Banking for bank personnel and the Graduate School of Banking for bank officers. During 1949 membership of the A.I.B. rose to more than 89,000, with more than 45,000 bank personnel enrolled in courses offered by 400 chapters and study groups, while the graduate school conducted at Rutgers university was attended by almost 1,000 bank officers. President (1949): F. Raymond Peterson, chairman of the board, First National Bank and Trust company, Paterson, N.J. Headquarters: 12 E. 36th St., New York, N.Y.

American Bar Association.—Founded in 1878 to advance the science of jurisprudence and promote the administration of justice in the U.S., this association had a membership of 41,840 as of Oct. 31, 1949. The year's activities included the presentation of the Ross prize to Ernest Wilkerson for his essay, "What Is the Proper Place and Function of the Lawyer in Society?" Awards of merit were also given the state bar associations of Ohio and Colorado and the local bar associations of Columbus, O., and Beverly Hills, Calif. Publications: *American Bar Association Journal,* a monthly, and an annual volume of reports and proceedings, plus various pamphlets. Officers (1949): Harold J. Gallagher, president; Joseph D. Stecher, secretary, Harold H. Bredell, treasurer. Headquarters: 1140 N. Dearborn St., Chicago 10, Ill.

American Bible Society.—Founded in 1816, the society encourages the wider circulation of the Bible without note or comment and without purpose of profit. During 1949 it aided translators of the Scriptures, especially those working among primitive tribes; published approximately 12,000,000 Scripture volumes in the U.S., Germany, Sweden, Switzerland, Mexico, Brazil, Japan, China, Syria and Siam; distributed approximately 10,000,000 Scripture volumes in 153 languages and in about 40 countries; also distributed 15,000 volumes for the blind. Membership (1949): about 150,000. Publication: *Bible Society Record.* Officers (1949): Eric M. North; Frank H. Mann; Frederick W. Cropp; Robert T. Taylor; Francis C. Stifler; Gilbert Darlington. Headquarters: 450 Park Ave., New York 22, N.Y.

American Chemical Society.—Organized in 1876, the society aims at advancing chemistry in all its branches; promoting research in chemical science and industry; and improving the qualifications and usefulness of chemists and increasing the spread of chemical knowledge. In 1949 the membership of 62,208 was organized in 130 local sections covering most of the U.S., Canada, Hawaii and Puerto Rico; divisions are organized by members with similar technical interests regardless of geographical location. There were 19 divisions in 1949. Publications included: *Analytical Chemistry; Chemical Abstracts; Chemical and Engineering News; Industrial and Engineering Chemistry; Journal of the American Chemical Society; Journal of Physical and Colloid Chemistry; Chemical Reviews; Journal of Chemical Education; Rubber Chemistry and Technology.* Officers (1949): president, Linus Pauling; executive secretary, Alden H. Emery; treasurer, Robert V. Mellefont. Headquarters: 1155 16th St. N.W., Washington 6, D.C.

American College of Dentists.—The college was founded in 1920 to promote the ideals of the dental profession, advance the standards and efficiency of dentistry, stimulate graduate study, reward meritorious achievement by dentists and improve public appreciation of oral health service. Membership in 1949 was about 1,450. Its convocation was held in San Francisco, Calif., Oct. 16, 1949. The *Journal of the American College of Dentists* is issued quarterly. Officers (1949): Earl W. Swinehart, president; P. V. McParland, vice-president; O. W. Brandhorst, secretary; Harold S. Smith, treasurer. Headquarters: 4952 Maryland Ave., St. Louis, Mo.

American College of Life Underwriters.—Founded in 1927 to establish an educational standard for the profession of life underwriters and to encourage formal training for this field, the organization awards qualified candidates a professional certificate of recognition. By the end of 1949, 3,338 persons had been awarded this certificate (C.L.U.), and 88 had been awarded the certificate of proficiency. In June 1949, 2,967 candidates took examinations for the certificate at 148 universities and colleges, and a total of 3,944 examinations were taken during the year. A total of 3,590 persons had completed the five examinations necessary for the certificate, and 5,507 others had credit for one or more of the examinations. Publications: *Annual Announcement; Annual Report;* and brochures. Officers (1949): Julian S. Myrick, chairman of the board; S. S. Huebner, president; Joseph H. Reese, secretary. Headquarters: 3924 Walnut St., Philadelphia 4, Pa.

American College of Surgeons.—Founded in 1913 to elevate the standards of surgery, the organization issues an annual list of approved hospitals, including those approved for graduate training in surgery, for cancer detection and research, and also lists approved medical services in industry. The college in Oct. 1949 was host to the sixth Inter-American Congress of Surgery in Chicago, Ill. Its membership in 1949 was 15,750, and its endowment $1,000,000. Publications: *Surgery, Gynecology and Obstetrics* and a quarterly bulletin. Officers (1949): Frederick A. Coller, president; Donald G. Tollefson and Robert M. Moore, vice-presidents; Paul B. Magnuson, secretary; Warren H. Cole, treasurer. Headquarters: 40 E. Erie St., Chicago 11, Ill.

American Economic Association.—This professional association of economists was founded in 1885 to encourage economic research, especially the historical and statistical study of conditions of industrial life, and to issue publications on and encourage discussion of economic subjects. Membership (1949): 6,400 members and 2,500 library, corporate and individual subscribers. The program of the annual meeting held in New York, N.Y., Dec. 27–30, 1949, covered a variety of subjects, including the problems of an advanced defense economy, population and resources and economic aspects of private enterprise. Publications: *American Economic Review* (quarterly); *Papers and Proceedings.* Officers (1949): Howard S. Ellis, president; James W. Bell, secretary-treasurer. Headquarters: Northwestern university, Evanston, Ill.

American Geographical Society.—This society was founded in 1852 to promote geographical research and exploration and to assemble and disseminate geographical knowledge through its publications and its library. In 1949 the society established a new department of medical geography; continued its long-term program of glacier studies with expeditions to Patagonia, Alaska and the Canadian Rockies; completed, under contract with the army map service, a revision of a number of sheets of its map of Hispanic America in the scale of 1:1,000,000. Publications: *Geographical Review* (quarterly); *Current Geographical Publications* (monthly bibliography). Membership (1949): about 4,500. Officers (1949): Richard Upjohn Light, president; John K. Wright, director. Headquarters: Broadway at 156th St., New York 32, N.Y.

American Historical Association.—Founded in 1884, and incorporated by act of congress in 1889, the association has for its purpose the promotion of historical studies, the collection and preservation of historical manuscripts, and kindred purposes in the interests of U.S. history and history in the U.S. Membership (1949) was 5,200; the association's annual meeting was held in Boston, Mass., Dec. 28–30, 1949. Publications: *American Historical Review: Annual Reports;* and selected historical monographs. Endowment: $279,000, of which $144,000 is restricted. Officers (1949): Conyers Read, University of Pennsylvania, president; Samuel E. Morison, Harvard university, vice-president; Guy Stanton Ford, executive secretary and editor; Solon J. Buck, treasurer. Headquarters: Library of Congress annex, Washington 25, D.C.

American Institute for Property and Liability Underwriters, Inc.—This organization was founded in 1942 to establish an educational standard for its field and to encourage formal training of property and casualty underwriters. The institute holds annual examinations for certification of underwriters, which 316 candidates had passed by the end of 1949. An additional 1,060 persons had credit for one or more of the five examinations, which during the year were held at 97 examination centres located in 39 states, the District of Columbia and Hawaii. Publication: *Announcement,* annual. Officers (1949): S. S. Huebner, chairman of the board of trustees; Charles E. Hodges, president; Arthur C. Goerlich, secretary. Headquarters: 3924 Walnut St., Philadelphia 4, Pa.

American Institute of Accountants.—A national professional society of certified public accountants, founded in 1887 to maintain high standards of education and practice for the profession and to develop the techniques of accounting in the public interest, the American institute had a membership in 1949 of more than 14,000. The year's activities included: continued promotion of improvements in federal income tax and government organization; continued preparation of the uniform C.P.A. examination in use in every state and territory but one; further development of testing programs for accounting students. Publications: *Journal of Accountancy* and *Certified Public Accountant*, both monthly. Officers (1949–50): J. Harold Stewart, president; Warren W. Nissley, treasurer. Headquarters: 270 Madison Ave., New York 17, N.Y.

American Institute of Chemical Engineers.—Founded in 1908 to advance chemical engineering in theory and practice and to maintain a high professional standard among its members, the institute in 1949 had a membership of 9,641. Meetings were held in Los Angeles, Calif., Tulsa, Okla., Montreal, Que., and Pittsburgh, Pa. The publication *Chemical Engineering Progress* is issued monthly. Officers (1949): F. J. Curtis, president; W. L. McCabe, vice-president; S. L. Tyler, secretary; C. R. DeLong, treasurer. Headquarters: 120 East 41st St., New York 17, N.Y.

American Institute of Electrical Engineers.—Founded in 1884 to advance the theory and practice of electrical engineering and of allied arts and sciences, this institute had on Sept. 1, 1949, a membership of 33,380. It had 39 technical committees working in five groups on: communication, industry, science and electronics, general applications and power. Publications: *Electrical Engineering*, a monthly; *Transactions; Standards;* and special publications. Officers (1949): James F. Fairman, president; H. H. Henline, secretary. Headquarters: 33 West 39th St., New York 18, N.Y.

American Institute of Mining and Metallurgical Engineers.—This society was founded in 1871 to promote the arts and sciences connected with the economic production of the useful minerals and metals, and the welfare of those employed in these industries. Membership in 1949 was 15,800, plus 4,500 student associates. In 1949 a new series of monthly journals was instituted: *Mining Engineering; Journal of Metals;* and *Journal of Petroleum Technology;* these replaced former publications. Endowed funds consisted of $830,000. Officers (1949): L. E. Young, president; Edward H. Robie, secretary; Andrew Fletcher, treasurer. Headquarters: 29 West 39th St., New York 18, N.Y.

American Iron and Steel Institute.—This organization was founded in 1908 to provide for mutual exchange of information and experience, to encourage and co-ordinate industry research, compile statistics and promote the use of iron and steel. Activities in 1949 included those of a joint committee to expedite the flow of scrap; joint industry research into 38 phases of iron and steel use; collection of statistics indicating that combined expansion programs of steel companies for 1947–50 aggregated 7,600,000 tons. Membership (1949): 98 company members; 463 associate members; 1,750 active; 58 emeritus; and 6 honorary memberships. Publications: *Steelways*, bimonthly; *Steel Facts; Yearbook; Annual Statistical Report; Directory of Iron and Steel Works;* and others. Officers (1949): Walter S. Tower, president; B. F. Fairless and Frank Purnell, vice-presidents; Harold L. Hughes, treasurer; George S. Rose, secretary. Headquarters: 350 Fifth Ave., New York 1, N.Y.

American Law Institute.—Founded in 1923, the institute seeks the clarification and simplification of the law and its better adaptation for social needs, the better administration of justice and the encouragement of scholarly and scientific legal work. During 1949 tentative approval was given a uniform commercial code, drafted in co-operation with the National Conference of Commissioners on Uniform State Laws. Progress was also made in the continuing legal education program of the institute, conducted in co-operation with the American Bar association, to make available through local bar associations courses and literature on selected phases of the law. Work also advanced on the drafting of new provisions for an amended federal income tax statute. The Institute numbered 1,070 elected and 249 ex-officio members in 1949. Numerous publications deal with specific aspects of the law. Officers (1949): Harrison Tweed, president; William A. Schnader, 1st vice-president; John G. Buchanan, 2nd vice-president; William Dean Embree, treasurer. Herbert F. Goodrich was director. Headquarters: 133 S. 36th St., Philadelphia 4, Pa.

American Mathematical Society.—This society was founded in 1888 to encourage and maintain an active interest in mathematical science. Membership in 1949 included 4,000 individuals and 104 institutions. Publications: *Bulletin of the American Mathematical Society; Transactions of the American Mathematical Society; Mathematical Reviews; Colloquium Publications; Mathematical Surveys.* Officers (1949): J. L. Walsh, president; J. R. Kline, secretary. Headquarters: 531 West 116th St., New York 27, N.Y.

American Society of Civil Engineers.—The society was founded in 1852 for the purpose of advancing the sciences of engineering and architecture. Membership as of Nov. 1949 was 27,240. Professional activities of the society were directed through its headquarters, its professional committees, student chapters in 127 engineering colleges and the 13 following technical divisions: air transport, city planning, construction, engineering economics, highways, hydraulics, irrigation, power, sanitary engineering, soil mechanics and foundations, structural, surveying and mapping, and waterways. Publications: *Proceedings*, monthly; *Transactions*, yearly; *Civil Engineering*, monthly; and a *Yearbook*. Officers (1949): Franklin Thomas, president; (1950) Ernest E. Howard, president; William N. Carey, executive secretary. Headquarters: 33 W. 39th St., New York 18, N.Y.

American Society of Composers, Authors and Publishers (ASCAP).—Founded in 1914 to assure equitable payment of royalties for public performances of copyrighted musical material, the society in 1949 numbered 2,040 composer and author members and about 400 publishers. President for the 1949–50 term was Fred E. Ahlert; vice-presidents were Saul H. Bourne and Otto A. Harbach; secretary was George W. Meyer and treasurer was Louis Bernstein. Headquarters: 30 Rockefeller Plaza, New York, N.Y.

American Society of Mechanical Engineers.—Founded in 1880 to promote the art and science of mechanical engineering and allied arts and sciences, the association's 1949 membership numbered more than 30,000, and its year's activities included four national meetings and conferences of six professional divisions. Publications: *Mechanical Engineering*, monthly; *Journal of Applied Mechanics*, quarterly; *Transactions;* an annual catalogue and directory; and *Applied Mechanics Reviews*, synopsizing world literature in applied mechanics. Officers (1949): James M. Todd, president; Clarence E. Davies, secretary. Headquarters: 29 West 39th St., New York 18, N.Y.

Brookings Institution.—A nonprofit organization founded in 1927 and dedicated to public service through research and education in economics and government, the institution receives income from its own endowments, from annual grants from foundations and from the sale of publications. Its 1949 activities included a conference on university and college teaching of international relations, held at Lake Forest, Ill., in July, and the publication of: *Overseas Information Service of the U.S. Government*, by Charles A. H. Thomson; *Toward Efficient Democracy*, by A. C. Millspaugh; *Federal Employees in War and Peace*, by Frances T. Cahn; *Controlling Factors in Economic Development*, by Harold G. Moulton; *Automotive Transportation* by Wilfred Owen; *National Transportation Policy* by Charles L. Dearing and Wilfred Owen. Officers (1949): Harold G. Moulton, president; Lewis Meriam, vice-president; Elizabeth H. Wilson, secretary. Headquarters: 722 Jackson Place, Washington, D.C.

Buhl Foundation, The.—Established in 1927, the foundation has by 1949 granted to existing or especially established agencies a total of $6,086,181 for the promotion of nationally significant programs in the Pittsburgh district, in the fields of regional economics, historical and social research, higher education and research in the natural sciences. The foundation pioneered in a demonstration of a large-scale planned residential community through its $1,700,000 Chatham Village. It maintains the Buhl Planetarium. Foundation assets in 1949 were $12,649,498. Director (1949): Charles F. Lewis. Headquarters: Farmers Bank building, Pittsburgh 22, Pa.

Carnegie Trusts.—Six autonomous and separately administered agencies in the U.S. were established by Andrew Carnegie for various philanthropic purposes; in addition there are four Carnegie trusts in Great Britain, and Carnegie Hero funds operate in nine European countries.

Carnegie Corporation of New York (1911), with a basic endowment of $135,000,000 and 1949 assets of more than $173,000,000, aims at the advancement and diffusion of knowledge among the people of the U.S. and the British dominions and colonies, its 1949 program stressing support of specific undertakings, especially in the social sciences, in institutions of higher education and in organizations and agencies devoted to general education in national and international affairs. President (1949), Charles Dollard; secretary, Robert M. Lester. Headquarters: 522 Fifth Ave., New York 18, N.Y.

Carnegie Institute of Pittsburgh (1896) includes a department of fine arts, a music hall and a museum of natural history, and to it are closely related the Carnegie Library of Pittsburgh, the Carnegie Library school and the Carnegie Institute of Technology. President (1949), James M. Bovard; secretary, Augustus K. Oliver. Headquarters: 4400 Forbes St., Pittsburgh 13, Pa.

Carnegie Institution of Washington (1902), which in 1949 had assets of more than $40,000,000, conducts fundamental scientific investigation, particularly in astronomy, terrestrial magnetism, plant biology, embryology, genetics and archaeology. President (1949), Vannevar Bush; executive officer, Paul A. Scherer. Headquarters: 1530 P St., N.W., Washington 5, D.C.

Carnegie Hero Fund Commission (1904), with assets in 1949 of about $10,000,000, was established to recognize by medals and monetary awards heroic acts performed in peaceful walks of life. President (1949), Thomas S. Arbuthnot; manager, C. B. Ebersol. Headquarters: Oliver building, Pittsburgh 22, Pa.

Carnegie Foundation for the Advancement of Teaching (1905) was established to provide retiring pensions for teachers and to advance higher education, having received $31,000,000 from Carnegie and substantial additional sums from the Carnegie corporation for a program to improve teaching in southern colleges. President (1949), Oliver C. Carmichael; secretary, Robert M. Lester. Headquarters: 522 Fifth Ave., New York 18, N.Y.

Carnegie Endowment for International Peace (1910) uses the income from its $10,000,000 endowment to further friendly understanding among nations, its aim in 1949 being to support the United Nations by stimulating public education in foreign affairs and by conducting studies and seminars. President (1949), James T. Shotwell; secretary, E. N. Thompson. Headquarters: 405 West 117th St., New York 27, N.Y.

Catholic Community Service, National.—This service organization was founded Nov. 13, 1940, as the agency designated by the Catholic bishops of the U.S. to mobilize and co-ordinate the Catholic resources of the country to serve the spiritual, educational, recreational and welfare needs of men and women in the armed forces, patients in Veterans' administration hospitals and their families. During 1949 the N.C.C.S. conducted programs in 49 activities located near major military establishments in the U.S. and overseas; conducted veterans' programs in 85 Veterans' administration hospitals; and loaned staff members to the president's committee on religion and welfare in the armed forces. Publications: the *NCCS Newsletter*, a house organ; *NCCS-VA Hospital News;* and various pamphlets. The N.C.C.S. receives funds from the United Service organizations, which is a beneficiary of the community chest. Thomas D. Hinton was executive director in 1949. Headquarters: 1312 Massachusetts Ave., N.W., Washington 5, D.C.

Catholic Library Association.—This international organization of librarians, educators and others interested in the promotion of Catholic literature and scholarship was founded in 1936. Its 1949 membership was 1,662 and activities included the 23d annual conference, in Detroit, Mich., observance of Catholic Book Week, and publication of: *Catholic Library World; Catholic Periodical Index; Catholic Supplement to Standard Catalog for High School Libraries; Catholic Supplement to the Children's Catalog; Books for Catholic Colleges; Catholic Booklist, 1949.* John O'Loughlin, librarian, Boston college, was president-elect in 1949; Laurence A. Leavey, Manhattan college, was secretary-treasurer. Headquarters: P.O. Box 25, Kingsbridge Station, New York 63, N.Y.

Catholic Organizations for Youth.—Generally these organizations are organized on diocesan lines, numbering about 120; the central co-ordinating agency is the youth department of the National Catholic Welfare conference, whose director in 1949 was Joseph E. Schieder. In addition to diocesan organizations there were also the National Federation of Catholic College Students, the Newman Club federation, the Columbian Squires, the Junior Catholic Daughters of America and others, all dedicated to the promotion of the spiritual welfare and the intellectual and social development of their members. Diocesan organizations generally planned their programs along the lines of spiritual, cultural, social and athletic activities. The total number of young people reached by these programs was estimated at 5,000,000 or 6,000,000. Publications were issued by various local units, while the youth department of the National Catholic Welfare conference was the centre for national publications.

Catholic Rural Life Conference, National.—Founded in 1923, this organization's aims are to care for underprivileged Catholics living on the land; to help keep Catholics living on the land; and to convert to Catholicism others living on the land. During 1949 the conference urged the overhaul of farm price support systems in the interest of the family-type farmer and called for minimum wage rates for agricultural workers and for standard living conditions for displaced persons resettled on farms. Publication: *Christian Farmer* (monthly). Officers (1949): president, Bishop John P. Treacy, of LaCrosse, Wis.; executive secretary, Msgr. L. G. Ligutti. Headquarters: 3801 Grand Ave., Des Moines, Ia.

Catholic Welfare Conference, National.—Founded in 1919, the aim of this organization is to unify, co-ordinate and organize the Roman Catholics of the U.S. in works of education, social welfare, immigrant aid and other activities. Operating departmentally, the conference's 1949 program included: a survey of secondary education; production of radio programs by the National Council of Catholic Men; collection of more than 1,000,000 pieces of new and worn clothing by the National Council of Catholic Women; formulation of plans for the establishment of a National Catholic Youth council; forwarding by the War Relief Services of a total of 51,036,406 lb. of food, clothing and medicine valued at more than $6,000,000. Publication: *Catholic Action.* Officers (1949): Archbishop John T. McNicholas of Cincinnati, O., chairman; Archbishop Francis P. Keough of Baltimore, Md., vice-chairman; Bishop John M. Gannon of Erie, Pa., treasurer; Bishop John F. Noll of Fort Wayne, Ind., secretary. Headquarters: 1312 Massachusetts Ave., N.W., Washington 5, D.C.

Charles Hayden Foundation.—Established in 1937 through the residuary estate of Charles Hayden, the foundation by Sept. 30, 1949, had contributed $14,588,000 for the founder's purpose: to assist needy boys, especially of the New York and Boston metropolitan areas, and with particular emphasis on boys' clubs, boys' camps and similar projects. On Sept. 30, 1949, there were approximately $53,000,000 in the fund. Officers (1949): J. Willard Hayden, president; Edgar A. Doubleday, executive vice-president; Erle W. Daveler, vice-president. Headquarters: 25 Broad St., New York 4, N.Y.

Commonwealth Fund.—Established in 1918 by Mrs. Stephen V. Harkness "to do something for the welfare of mankind," the fund in 1949 amounted to approximately $50,000,000, and appropriations for the nine months ending June 30, 1949, were $2,135,559.32. Activities tending to promote or maintain health accounted for three-fourths of this total, with emphasis on medical research, experimental health services and public health activities, regional hospital activities, medical education and medical fellowships. Thirty-one men and three women held Commonwealth fund fellowships for 1949–50 for students and civil servants from Great Britain and other parts of the British commonwealth. Five books and one pamphlet were published. There are nine directors, including Malcolm P. Aldrich, president. Headquarters: 41 East 57th St., New York 22, N.Y.

Duke Endowment, The.—This endowment was established as a common-law trust by an indenture executed Dec. 11, 1924, by James B. Duke "to make provision in some measure for the needs of mankind along physical, mental and spiritual lines." The fund allocates payments to four educational institutions—Duke university, Davidson college, Furman university and Johnson C. Smith university—and distributions are also made to support hospitals, orphanages, superannuated Methodist preachers and rural churches. The amount distributed from Dec. 11, 1924, to Dec. 31, 1948, was $74,704,562.96, in addition to a reserve fund and a retained balance that totalled $80,547,951.22 net income earmarked as available for distribution. The fund is supervised by a self-perpetuating board of 15 trustees. Puplication: *The Duke Endowment Year Book.* Officers (1949): George G. Allen, chairman; Alexander H. Sands, Jr., secretary; Walter C. Parker, treasurer. Headquarters: Power building, Charlotte 1, N.C.

Elks, Benevolent and Protective Order Of.—A fraternal order organized in 1868 to practise charity, brotherly love, justice and fidelity; to promote the welfare and enhance the happiness of its members; to quicken the spirit of U.S. patriotism; and to cultivate good fellowship. In 1949 membership in 1,530 lodges was 975,000. Charitable expenditures were almost $6,000,000. A national essay contest was sponsored on the subject, "Why Democracy Works," and fraternal centres were reopened for young men in the armed services. Publication: *Elks Magazine,* monthly. Officers (1949): Emmett T. Anderson of Tacoma, Wash., grand exalted ruler; J. E. Masters of Chicago, Ill., grand secretary. Headquarters: 2750 Lakeview Ave., Chicago 14, Ill.

Falk Foundation, The Maurice and Laura.—Founded in 1929 to advance human welfare, the foundation supports research into basic economic problems. Grants in 1949 totalled $367,000, principally to the Brookings institution, for a survey of medical service in the U.S. and a study of social security costs and financing methods, and to the Alfred P. Sloan Foundation, Inc., to further its motion-picture techniques for presenting economic information. Allotments were also made to the United Jewish fund, the community chest of Allegheny county, Pa., and to the University of Pittsburgh. Publications in 1949: *Economic Systems; Industry-Wide Bargaining; Our National Debt, Its History and Its Meaning Today; The Rising Trend of Government Employment;* and *Controlling Factors in Economic Development.* Funds as of Dec. 31, 1948: $7,664,573.40. Officers (1949): Leon Falk, Jr., chairman; Arthur E. Braun, treasurer; Eugene B. Strassburger, secretary; J. Steele Gow, executive director. Headquarters: 1911 Farmers Bank building, Pittsburgh 22, Pa.

Ford Foundation, The.—Incorporated as a nonprofit corporation under the laws of the state of Michigan on Jan. 15, 1936, to receive and administer funds for scientific, educational and charitable purposes, all for the public welfare, the foundation made contributions during 1949 (as of Oct. 5) of $2,750,000. Assets were approximately $215,000,000. Officers (1949): Henry Ford II, president; B. J. Craig, secretary and treasurer. Headquarters: 2612 Buhl building, Detroit 26, Mich.

Franklin Institute of the State of Pennsylvania.—This nonprofit institution, founded in 1824 for the promotion of the mechanic arts, devotes itself to the interpretation of science for the benefit of nontechnical persons through: the Benjamin Franklin Memorial; the *Journal,* a monthly publication which reports scientific developments; lectures; a library of 131,000 volumes, 46,000 pamphlets and 4,000 maps; a museum of science and industry including a planetarium; research laboratories; and honour awards for distinguished achievements in science and technology. Income is derived from endowments; dues from more than 5,000 members; museum admissions; and research sponsors. Officers (1949): Richard T. Nalle, president; Henry B. Allen, executive vice-president and secretary. Headquarters: 20th St. and Benjamin Franklin Pkwy., Philadelphia 3, Pa.

Future Farmers of America.—The Future Farmers of America, incorporated in 1928, is a national organization of boys studying vocational agriculture in public secondary schools under the provisions of the national vocational education acts; the chief of the Agricultural Education service of the U.S. office of education is chairman of an adult national advisory council. The organization's purpose is to develop competent, aggressive, rural and agricultural leadership; to improve techniques of farming; and generally to develop scientific farm programs. Activities during 1949 included the conduct of dairy-cattle-, dairy-product- and poultry-judging contests at Waterloo, Ia., Oct. 4–6; livestock and meat judging at Kansas City, Mo., Oct. 13–15; national F.F.A. convention at Kansas City, Oct. 10–13; and national F.F.A. week, held annually during the week of George Washington's birthday. Membership in 1949 was 280,111. Officers (1949): Doyle Conner, Starke, Fla., president; A. W. Tenney, Office of Education, Washington, D.C., executive secretary. Headquarters: Office of Education, Washington 25, D.C.

Georgia Warm Springs Foundation.—Founded by Franklin D. Roosevelt in 1927 for the study and treatment of the aftereffects of poliomyelitis and for the spread of medical knowledge in this field, the foundation conducts a hospital at Warm Springs, Ga., to which patients are admitted only after the disease has passed the acute stage. Almost 900 patients were treated during 1949. The foundation's activities are financed primarily by grants from the National Foundation for Infantile Paralysis. Officers (1949): Basil O'Connor, president and treasurer; William F. Snyder, vice-president and secretary; Raymond H. Taylor, executive secretary; and C. E. Irwin, medical director and chief surgeon. Headquarters: 120 Broadway, New York 5, N.Y.

Guggenheim Memorial Foundation, John Simon.—The foundation was established in 1925 to improve the quality of education and the practice of the arts and professions, to foster research and to provide for the cause of better international understanding. During 1949 it awarded fellowships to 138 applicants from the U.S., 5 from Canada and 22 from Latin American countries. Officers (1949): Mrs. Simon Guggenheim, president; Francis H. Brownell, vice-president; Henry Allen Moe, secretary; Otto L. Myers, treasurer. Headquarters: 551 Fifth Ave., New York 17, N.Y.

International College of Surgeons.—Founded in 1935, this association aims to create a common bond among surgeons of all nations. Membership in 1949 was reported as 6,000. Publication: *Journal of the International College of Surgeons,* bimonthly. During 1949 an international postgraduate exchange and information bureau was established. Officers (1949): Francisco Graña, Lima, Peru, president; Max Thorek, Chicago, Ill., international secretary-general. Headquarters: 1516 Lake Shore drive, Chicago, Ill.

Jewish Welfare Board, National.—This organization was founded in 1913 to serve as a national association of Jewish community centres and Young Men's and Young Women's Hebrew associations; to sponsor co-ordinated national cultural projects, such as the Jewish Book Council of America, National Jewish Youth conference, etc.; and to serve as a government-recognized agency for meeting the religious, welfare and morale needs of Jewish personnel of the armed forces and in Veterans' administration hospitals. Membership in 1949 included 321 affiliated Jewish community centres with 500,000 members and 41 affiliated national Jewish organizations. Publications: *JWB Circle; Jewish Music Notes; In Jewish Bookland; Women's Division Bulletin; Jewish Center Program Aids.* Officers (1949): Frank L. Weil, president; Joseph Rosenzweig, secretary; S. D. Gershovitz, executive director. Headquarters: 145 E. 32d St., New York 16, N.Y.

Kellogg Foundation.—Founded in 1930, the W. K. Kellogg foundation had as its goal the promotion of the health, education and welfare of mankind, principally of children and youth, without regard to race, sex, creed or nationality. Its continuing program includes the making of grants to established organizations for the conduct of their activities in the fields of medicine, dentistry, general education, public health, hospital work and nursing. Funds in 1949 amounted to $31,970,000, received chiefly from W. K. Kellogg, chairman of the board of trustees. Publications: *W. K. Kellogg Foundation—The First 11 Years* (now out of print); *Medical Diagnostic Services for Small Communities* (1949). Officers (1949): Emory W. Morris, president and general director; Glenn A. Cross, vice-president and assistant treasurer; Bessie Rogers Young, secretary and treasurer. Headquarters: 250 Champion St., Battle Creek, Mich.

Kiwanis International.—This fraternal organization was founded in 1915, and its constituent local clubs include representative business and professional men. Membership in 1949 numbered 200,000 in more than 3,000 clubs. Activities included raising of nearly $18,000,000 for community chest and other welfare drives, provision of recreational opportunities for 1,650,000 young people and assistance of 7,500 juvenile delinquents. More than 8,000 campaigns were conducted in behalf of safety, universal voting, increased church attendance and the prevention of traffic congestion. Publications: *Kiwanis Magazine* and intraorganization publications. Officers (1949): J. Hugh Jackson, president; Lee F. Campbell, treasurer;

D. E. Peterson, secretary. Headquarters: 520 North Michigan Ave., Chicago 11, Ill.

Knights of Columbus.—Founded in 1882, this organization's goal is to render financial aid to members and their beneficiaries; to render assistance to sick and disabled members; and to promote educational, char-table, religious, social, war relief and public relief work. During 1949 t continued its program of disseminating information on Roman Catholic tenets through newspaper advertising and made available without charge to radio stations a third series of recordings on "The Preservation and Promotion of American Ideals." Thirty-three new circles of the order's boys' society, the Columbian Squires, were organized during 1948–49; 184 K. of C. councils established discussion groups. Membership during 1949: 763,451; publication: *Columbia* (monthly). John E. Swift was supreme knight. Headquarters: 45 Wall St., New Haven 7, Conn.

League of Women Voters of the United States.—Founded in 1920 to encourage the participation of citizens in government, this organization had 89,000 members in 1949. During the year it emphasized support of the United Nations, conducted fiscal studies so that it could support measures making for a stable national economy and laid plans to stimu-ate citizens to become active workers in the political party of their choice, with special emphasis on the nomination of candidates. State and ocal activities stressed improvement of state constitutions and tax systems and better schools. Publications: *Action*, members' quarterly magazine, and *Trends*, biweekly, following developments in legislation. Miss Anna Lord Strauss was president in 1949. Headquarters: 726 Jackson Pl., N.W., Washington 6, D.C.

Lions Clubs, The International Association of.—Founded in 1917, this association of 385,000 members in 7,725 Lions clubs in 26 countries has its objectives the promotion of international good will, good government and good citizenship, civic betterment, promotion of good fellowship and provision of a forum for full discussion of matters of public interest. During 1949 Lions clubs completed 101,736 activities in the following fields: agriculture, boys' and girls' activities, citizenship and patriotism, civic improvement, community betterment, education, health and welfare, safety, sight conservation and the United Nations. The 1949 program also included plans for establishment of Lions International city 27 miles south of the Chicago loop. Publications: *The Lion* and *El León* (Span-sh), monthly; *Lions International Monthly Letter*. Officers (1949): president, Walter C. Fisher, Queenston, Ont., Can.; secretary-general, Melvin Jones. Headquarters: 332 S. Michigan Ave., Chicago 4, Ill.

Milbank Memorial Fund.—Founded in 1905, the fund is a membership corporation under the laws of New York state, established to improve the physical, mental and moral condition of humanity and generally to advance charitable and benevolent objects. Its 1949 activities included contributions in the field of public health. It had endowment funds, as of Dec. 31, 1948, of $10,244,625.41. Officers (1949): president, Morris Hadley; executive director, Frank G. Boudreau, M.D.; secretary, Catherine A. Doran. Headquarters: 40 Wall St., New York 19, N.Y.

Music Library Association.—This association was founded in 1931 to promote the interests of music libraries of the U.S. and to foster the general aim of musical research, and in 1949 had about 900 members. Publications: *Notes*, a quarterly journal, and supplements; lists of music periodicals and checklist of thematic indices and code for cataloguing music. Officers (1949): president, Scott Goldthwaite, University of Chicago; secretary, Frank C. Campbell, Music Division, Library of Congress, Washington 25, D.C.

National Academy of Sciences.—Founded in 1863, by act of congress, to investigate and report upon any subject of science when called upon by any governmental department, the academy in 1949 numbered 439 members and had an endowment of $3,550,000, in addition to funds for general and specific purposes. At the University of Rochester, Rochester, N.Y., in October, the academy decided that it would not be in the best nterest of science for the academy to continue to administer the Atomic Energy commission fellowship program in which Federal Bureau of Investigation inquiry was required for fellows working in nonsecret fields. During the latter part of 1949 an academy committee on cortisone supervised the allocation of this rare drug which was in great demand. Officers (1949): Alfred N. Richards, president; Raymund L. Zwemer, executive ecretary; William J. Robbins, treasurer. Headquarters: 2101 Constitution Ave., Washington 25, D.C.

National Association for Advancement of Colored People.—This organiza-ion was founded on Feb. 12, 1909, to safeguard the full political, civil and legal rights of Negro citizens and secure for them equality of opportunity. Its membership in 1949 numbered 350,000. Its activities during he year included legal and legislative approaches to the problems of un-qual educational facilities; segregation in housing; fair employment practices; lynching; and poll tax questions. Publications: *Crisis* maga-ine, monthly, and the *NAACP Bulletin*, quarterly. Officers (1949): Arthur B. Spingarn, president; Roy Wilkins, acting secretary; Louis T. Wright, chairman of the board of directors. Headquarters: 20 West 40th St., New York, N.Y.

National Association of Manufacturers.—Founded in 1895 as a mutual and co-operative organization of U.S. manufacturers to foster trade, business and financial interests, to secure freedom from unlawful and unjust xactions and to diffuse accurate and reliable information among its membership, the N.A.M. numbers about 15,000 members, and sponsored n 1949 committee activities in fields as varied as employee benefits, ocial security, conservation and federal debt management. Through its ctivities, industry's point of view is presented to the public through vailable media. Publications include the weekly *NAM News* and the uarterly *NAM Law Digest*. Officers (1949): Wallace F. Bennett, president; Earl Bunting, managing director; Noel Sargent, secretary; Kenneth R. Miller, treasurer. Headquarters: 14 West 49th St., New York, N.Y.

National Association of State Libraries.—The association was founded in 898 to advance the administration of state libraries and to provide a orum for discussion of problems affecting them. Membership in 1949 onsisted of 44 institutional, three honorary life and four associate members. Publications include the *Proceedings of Annual Meetings* and heck lists of collected public documents of the states, legislative journals nd supplement, statutes and session laws and supplement. Officers (1949): Charles F. Gosnell, state librarian, Albany, N.Y., president; Alfred Decker Keator, state librarian, Harrisburg, Pa., secretary-treasurer. Headquarters: State Librarian's office, Harrisburg, Pa.

National Lawyers Guild.—This organization was founded in 1937 as a bar association devoted to the interests of the people of the U.S. and the professional welfare of the lawyer, and aims to combat repressive measures intended to destroy constitutional safeguards. Its purpose is to defend the civil liberties of all the people. Membership in 1949 was approximately 4,000. Publications: *National Lawyers Guild Review* and *National Guild Lawyer*, both quarterly, and miscellaneous pamphlets and reports. Officers (1949): Clifford J. Durr, president; Nathan B. Kogan, treasurer; Robert J. Silberstein, executive secretary. Headquarters: 902 20th St., N.W., Washington 6, D.C.

Research Libraries, The Association of.—Founded in 1932, the association's purpose is to develop and increase, by co-operative effort, the resources and usefulness of the research collections in American libraries. Membership in 1948 included 48 institutions. Publications include *Doctoral Dissertations Accepted by American Universities*, published annually. Officers (1949): Charles W. David, executive secretary, with headquarters at the University of Pennsylvania library, Philadelphia, Pa., and an advisory board of five members.

Rockefeller Foundation.—Founded in 1913 to promote the well-being of mankind throughout the world, the foundation made grants in 1949 in the following fields: medical science, chiefly for research in psychiatry and neurology; natural sciences, with emphasis on experimental biology and agriculture; social sciences, on problems of international relations, economics and group relations; the humanities, on the promotion of intellectual and cultural exchange among nations. Its assets as of Dec. 31, 1948, were $122,280,016. Officers (1949): president, Chester I. Barnard; secretary, Flora M. Rhind. Headquarters: 49 W. 49th St., New York 20, N.Y.

Rotary International.—Founded in 1905 as an international organization of representative business and professional men for the purpose of furthering co-operation and good will in business and community life. In 1949 there were more than 6,900 Rotary clubs with a membership of more than 330,000 in 82 countries and geographical regions. Activities in 1949 included: continued provision of fellowship grants for graduate study by students in countries other than their own; development of international understanding through its consultative status with the Economic and Social council of the United Nations and with the United Nations Educational, Scientific and Cultural organization. Publications: *Report on U.N. by Rotary International*, monthly; *The Rotarian*, and *Revista Rotaria*, monthly; also regional Rotary magazines published throughout the world in several languages. Philip Lovejoy was general secretary in 1949. Headquarters: 35 E. Wacker Dr., Chicago, Ill.

Seeing Eye, Inc., The.—A national philanthropy founded in 1929 and supported through annual memberships, public contributions and bequests. The society's purposes include the training of dogs as guides for the blind and the teaching of the blind to use their dogs. Activities in 1949 including the provision of dog guides to 165 blind men and women, of whom 90 received their first dogs and 75 their second or third dog guides. Membership in 1949 was about 23,000; a total of 1,600 dogs had been trained for the blind since the organization's inception. Publications: *The Seeing Eye Guide*, published quarterly for members of The Seeing Eye, and printed booklets on the organization and its policies. Officers: (1949) Henry A. Colgate, president; W. H. Ebeling, executive-vice-president; James Carey, treasurer. Headquarters: Morristown, N.J.

Sloan Foundation, Inc., The Alfred P.—Founded in 1934, the foundation's interest first centred wholly on economic education and research, and though this continues as its primary interest it also makes extensive grants for cancer research. Activities supported also include teaching institutes at major universities and the University of Chicago Round Table. Net assets Dec. 31, 1948, were $12,822,209.11. Officers (1949): Alfred P. Sloan, Jr., president; Arnold J. Zurcher, vice-president and executive director; James F. Kenney, secretary and treasurer. Headquarters: 30 Rockefeller plaza, New York 20, N.Y.

Sodality of Our Lady.—Founded in Rome, Italy, in 1563, this organization aims at developing devotion to Mary as the mother of God and at aiding members in perfecting themselves and in co-operating in the apostolic mission of the Catholic Church. Membership, 1949: 16,224 sodalities in the U.S., of which 4,000 were in elementary schools. Activities in 1949 included the conducting of eight summer schools of Catholic Action. Many institutes, rallies and conventions were conducted throughout the U.S.; the visual-aids department produced material for sodality promotion and religious instruction. Publications: *The Queen's Work*, monthly, for teen age sodalists; *Action Now*, monthly, for adults; and instruction pamphlets and discussion guides. Officers (1949): J. Roger Lyons; F. L. Zimmerman; A. J. Heeg; and other members of the Society of Jesus. Headquarters: 3115 S. Grand Blvd., St. Louis 18, Mo.

Temperance League of America.—Established in 1895 as the Anti-Saloon League of America, this organization is the national federation of state temperance organizations. The league maintains research and legal departments, promotes public education on the toxic effect of alcoholic beverages, advocates abstinence from their use and urges the enactment of legislation to restrict their sale and consumption, through local option, state action and restriction on advertising of liquors in interstate commerce. The national organization served as a clearing house for affiliated units in 33 states in 1949. Publication: *American Issue*. Officers (1949): Clayton M. Wallace, general superintendent; Bishop G. D. Batdorf, president. National headquarters: 131 B St., S.E., Washington 3, D.C.

Twentieth Century Fund.—Founded in 1919 by Edward A. Filene, the organization conducts research and public education on current economic issues. During 1949 publications dealt with labour-management relations; economic appraisals of Turkey and Brazil; and studies of monopoly trends in U.S. business. The fund developed the findings of its study *America's Needs and Resources*, published in 1947; issued a graphic summary of these findings entitled *U.S.A.: Measure of a Nation;* and produced, jointly with Encyclopædia Britannica Films Inc., a two-reel motion picture *Productivity, Key to Plenty*. Total assets were $6,840,787, as of Nov. 30, 1949. Officers (1949): president, John H. Fahey; treasurer, A. A. Berle, Jr.; executive director, J. Frederic Dewhurst. Headquarters: 330 West 42nd St., New York 18, N.Y.

Woman's Christian Temperance Union, National.—This organization was founded in 1874 to unite Christian women of the U.S. to rally public sentiment for total abstinence from all alcoholic liquors and to abolish traffic in alcoholic liquors. Membership in 1949 was about 400,000; publications include *The Union Signal* (weekly) and *The Young Crusader* (monthly). Public education work in 1949 included the holding of classes and the distribution of leaflets and pamphlets. Officers (1949): Mrs. D. Leigh Colvin, president; Elizabeth A. Smart, corresponding secretary; Violet T. Black, treasurer. Headquarters: 1730 Chicago Ave., Evanston, Ill.

Women's Clubs, General Federation of.—The federation was founded in 1890 and chartered by the U.S. government in 1901 to unite the women's clubs and like organizations throughout the world for mutual benefit, and to promote common interests in education, philanthropy, public welfare, moral values, civics and fine arts. International membership in 1949 was about 11,000,000, about one-half in the U.S. The year's activities centred on strengthening the United Nations and promoting world peace; contributions to war-devastated areas; scholarship and health and recreational services for youth in the U.S., and a prize contest on "Build a Better Community." Publication: *General Federation Clubwoman* (monthly). Officers (1949): Mrs. J. L. Blair Buck, president; Mrs. Earl B. Shoesmith, secretary; Mrs. Charles L. Fuller, treasurer. Headquarters: 1734 N St., N.W., Washington 6, D.C.

Young Men's Christian Association.—A world-wide fellowship seeking to improve the spiritual, social, recreational and physical lives of young people, the Y.M.C.A. was founded in London in 1844. For 1948, enrolments in various activities totalled 3,202,809. By Aug. 31, 1949, $5,599,165 of the $8,650,000 World Youth Fund for Reconstruction and Advance, related to needs in war-occupied and -devastated lands, had been raised. The national youth and government program was carried on in 1949 in 22 states; model state legislatures were held; the first national Conference of Boy Governors was held in June in Washington, D.C. Expenditures by the Y.M.C.A.s in the the U.S. in 1948 totalled $102,180,100, while capital investments totalled $246,682,300; endowed funds amounted to $46,102,700. Publications: National Council *Bulletin; Y.M.C.A. Year Book*. Officers (1949): Eugene R. McCarthy, president; Eugene E. Barnett, general secretary. Headquarters; 291 Broadway, New York 7, N.Y.

Young Womens Christian Association of the United States of America.—Founded in 1858 to build a fellowship of women and girls dedicated to the pursuit of Christian ideals, this organization in 1949 included 1,045 Y.W.C.A.'s conducting programs for women in the following fields: business, professional, industrial, agricultural, teen-agers, college and university students and home women. Emphasis in the Y.W.C.A. programs is on the promotion of physical health and mental and spiritual growth. In early 1949 the Y.W.C.A. constituency included 3,000,000 women and girls; the 1949 convention voted to change the Y.W.C.A. of the U.S.A. to a membership organization. Publications: *Women's Press* and *Bookshelf*. Officers (1949): Mrs. Arthur Forrest Anderson, president; Mrs. Roland P. Beattie, treasurer; Mrs. Harrison S. Elliott, general secretary. Headquarters: 600 Lexington Ave., New York 22, N.Y.

Zionist Organization of America.—Founded in 1897 to further the Zionist ideal and promote the interests of the Jewish renaissance, this organization had a membership in 1949 of 250,000. It awarded 12 fellowships for a year's study in Israel; sponsored a national drive to collect 300,000 tons of food for Israel; established a council to encourage capital investment there. Publications: *New Palestine; Inside Israel; Dos Yiddishe Folk*. Officers (1949): Daniel Frisch, president; Sidney Marks, executive director. Headquarters: 41 East 42d St., New York 17, N.Y.

Zonta International.—A service organization of executive women in business and the professions, founded in 1919, this organization promotes high ethical business and professional standards and the improvement of the legal, political, economic and professional status of women, plus international understanding through a world fellowship of executive women. Membership in 1949 included about 225 clubs with 7,500 members in the U.S. and other countries. Publication: *Zontian* and pamphlets. Officers (1949–50): Elizabeth Armstrong Judge, Cleveland, O., president; Harriet C. Richards, executive secretary. Headquarters: 59 E. Van Buren St., Chicago 5, Ill.

Sociology.

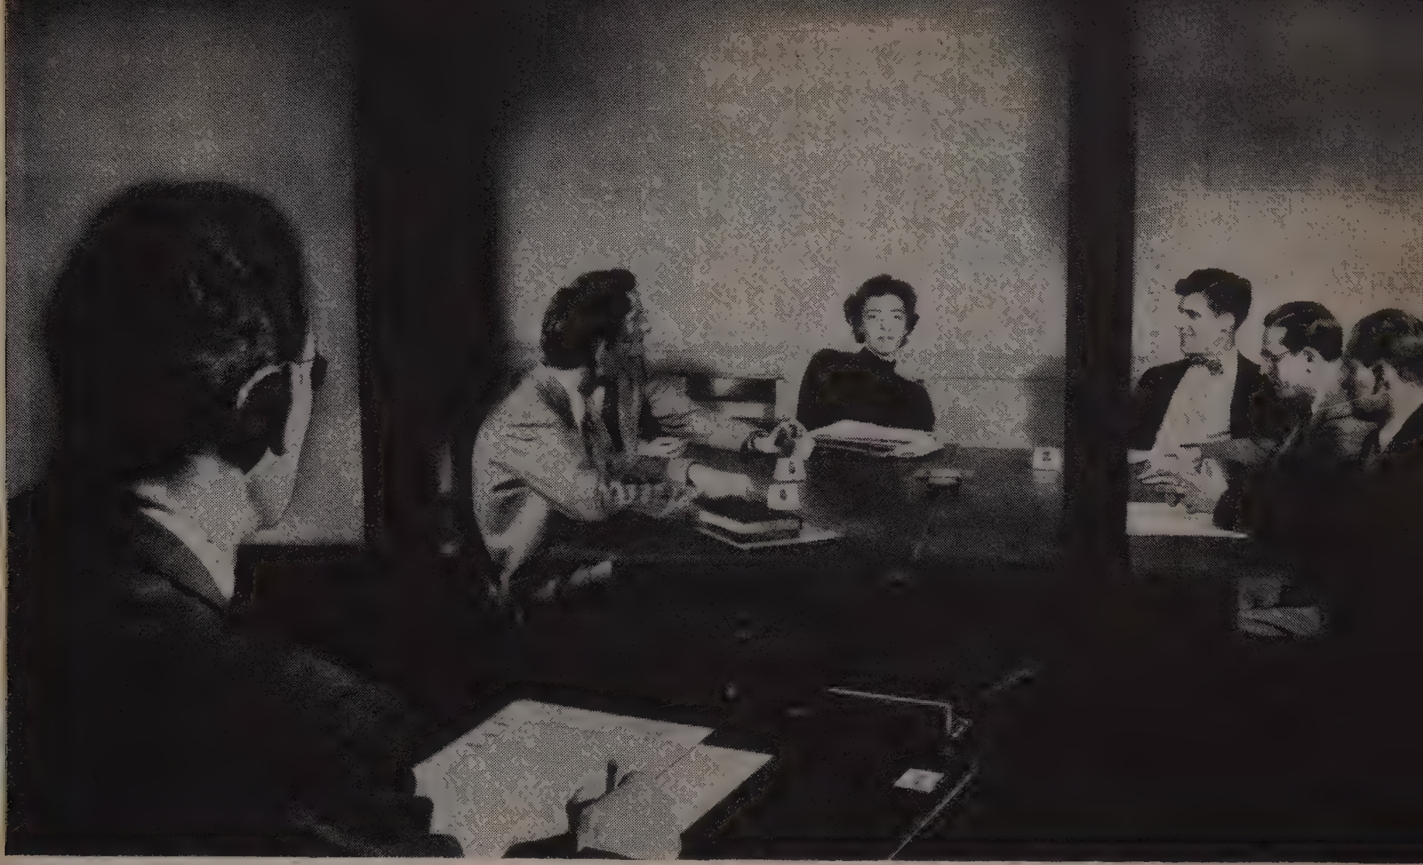
Among trends most clearly apparent in 1949 were: (1) waning of the child training emphasis in the personality and culture field; (2) emergence of the study of small groups as a field of major interest; (3) greatly increased interest in general sociological theory; (4) continuing attention to social stratification; (5) stronger interest in sociology of religion, albeit with primary reference to religious conflict; (6) sharp focus on the social-psychological problems dealt with in studies of United States troops during World War II; (7) prolonged discussion of the polls; and (8) evidences of a possibly developing Americanization of sociology in Europe and elsewhere.

During the postwar years a number of investigators, chiefly of anthropological background, had laid heavy stress on the presumably crucial importance of childhood feeding and toilet habits for the determining of adult character traits. In this emphasis they were followed by many social psychologists and sociologists. Secondary importance, only, was assigned to religious belief, political doctrine, class position and the like. So extreme did this trend become, however, that many of the previously uncritical began to question the conclusions about Japanese, German, American or Irish character which they had formerly accepted, and the result was a precipitate retreat, in some instances, from a position leading to patent absurdities. Nevertheless, the effect of persuasive anthropological accounts laden with the charm of the exotic, combined with the effect of a variety of psychoanalysis presented, like most other varieties, with evangelical fervour, sufficed to keep a number of believers within the fold, particularly when they were sociologists taking their anthropology and psychoanalysis at second hand. The most that could be said was that there was a distinct decline in enthusiasm and the voicing of distressing doubts.

In 1949 the American Sociological society established for the first time a section on the study of small groups, and R. F. Bales, active in the Laboratory of Social Relations at Harvard university, published an important book. It was important because for the first time a definite quantitative method for the study of social interaction in small groups was presented; hitherto only sterile field theory and topological analogies, or elaborately diagrammed verbalisms relying on terms lifted from other sciences, had been available as guides for the empirical researcher. In other words, the suggestive leads provided by Georg Simmel, Leopold von Wiese, and Ruth Hill Useem had been ignored. Bales' book not only took advantage of these leads, but explored the exploited new approaches. It was still too early to say whether the kind of quantification represented by Bales was likely to prove fruitful, more especially as key problems of cultural differentials were not directly confronted, but it provided a basis on which research leading to acceptance, rejection or modification of the method on grounds other than those of personal preference could be carried out.

General sociological theory had long been a stepchild of sociology, particularly in the United States, where raw empiricism had been in vogue since the middle 1920s. It was still in vogue in 1949, but the theoretical work of a new generation of U.S. sociologists, notably Talcott Parsons, Robert K. Merton and Kingsley Davis, had started a countervogue. True, this countervogue, using the slogan of structural-functional theory, had a host of uncritical followers, but it nevertheless represented a valuable shift in emphasis. Given this shift, it was apparent that earlier and equally significant theoretical work done in the United States and abroad would eventually emerge from stepchild status also and receive due although belated consideration. The major obstacle to theoretical advance was the unwillingness of publishers to issue treatises which had little prospect of extensive textbook use. This was partially overcome by the appearance of a few small, venturesome organizations. How long such noncommercial enterprises could survive was perhaps questionable, but in 1949 they had already rendered great service to U.S. sociology. Although the two U.S. sociological journals with the widest circulation, the *American Sociological Review* and *The American Journal of Sociology*, granted increased space, all things considered, to theoretical articles, the greatest proportional increase was registered by the North Carolina journal, *Social Forces*.

Social stratification studies, when they are beyond the journalistic level, necessarily lean heavily on general sociological theory. During 1949 W. Lloyd Warner's long-heralded book on social stratification appeared, but it unfortunately was pervaded by a kind of *ad hoc* theorizing that did little to integrate it with other work in the field. A. B. Hollingshead's study of "Elmtown," in spite of its limited focus, had a more readily adaptable theoretical framework. There were no journal articles of crucial importance in the stratification field, but continuing interest was apparent. This was particularly evident at the Christmas meet-



EXPERIMENTAL LABORATORY for the study of group interaction, set up in 1949 by Dr. Robert F. Bales of the Harvard Laboratory of Social Relations in Cambridge, Mass. Dr. Bales is shown recording observations behind a one-way window through which he could see but not be seen

ing of the American Sociological society, where three long papers on social stratification in Germany, the U.S.S.R. and England were presented in a two-hour session.

A field of much significance, sociology of religion, had until the late 1940s received little notice in the United States except in conjunction with the economic analyses of Max Weber and R. H. Tawney. This was in all probability the result of the areligious or even antireligious attitude of many U.S. sociologists; themselves uneasy about their own traditional religious backgrounds and possible unscientific biases, they had assumed that to be properly scientific one must avoid the study of religious conduct, except in a somewhat apologetic and disparaging way. Sociologists in Britain, and particularly on the continent, on the other hand, confronted by clericalist-anticlericalist movements, novel sects, state churches, *Kulturkampf, laicisme,* ecclesiastically sanctioned governments and many related matters, had long regarded sociology of religion as of the highest scientific import. The pages of the recently revived *L'Année sociologique* and *Kölner Zeitschrift für Soziologie,* as well as *Cahiers sociologiques,* the British *Sociological Review, Psychologie des peuples* and several other journals testified to this. Further, the elaborate bibliography by Daniel Warnotte which appeared posthumously during 1949 in the *Revue de l'Institut de Sociologie Solvay* was studded with books and articles on sociology of religion. Interest had begun to appear in the United States but, characteristically, in textbooks and collections of readings for students rather than in systematic treatises. This interest may have been evoked by the same series of events which brought forth Paul Blanshard's *American Freedom and Catholic Power,* but in any case it had become definitely apparent. Whether it would result in impartial, unbiased, *i.e.,* genuinely scientific, studies could not yet be foreseen.

A major effort at a genuinely scientific approach to prediction of military conduct was made in *The American Soldier in World War II,* a four-volume treatise (financed by the Social Science Research council) by Samuel Stouffer of Harvard university and others. Opinions about its merits differed sharply. In spite of the special session of the Sociological Research association devoted exclusively to discussion of the treatise at the Christmas meeting, it seemed clear that its merits and demerits had not yet been thoroughly assessed, and that controversy would continue for some time.

Similar controversy surrounded the aftermath of the polling debacle of the 1948 election. The Social Science Research council financed a large meeting in the spring of 1949 for discussion of what went wrong with the polls. No definite conclusions were reached, but most of the discussants, themselves active along related research lines, were sympathetic with the pollsters' plight, although at the same time critical of certain techniques.

Through the operation of the Fulbright grants, researchers on the staffs of the occupation forces in Germany and Japan, general North American influence in Mexico, Central and South America and in other ways, a trend toward the Americanization of sociology seemed to have emerged. Nels Anderson, with the occupation forces in Germany, secured the services of experts from the United States to carry out a study of the Darmstadt community, using younger German sociologists as field workers, tabulators, etc. J. H. Kolb of the University of Wisconsin, Madison, carried out a rural community research project in Norway for the University of Oslo. Jean Stoelzel of Bordeaux, Fr., trained at Columbia university, continued to head the French Institute of Public Opinion. John Bennett and Herbert Pessin of Ohio State university, Columbus, did much to influence developments in Japanese anthropology and sociology. Several British universities were endeavouring to secure the services of U.S. sociologists on short- and long-term bases, and the University of Ceylon did likewise. Howard Becker's book on German youth appeared in expanded form in German under the title of *Vom Barette Schwankt die Feder.* Louis Wirth of the University of Chicago, Ill., was elected first president of the new International Sociological society, sponsored by the United Nations Educational, Scientific and Cultural organization.

The Christmas meeting of the American Sociological society took place in New York city as part of the annual convention of the American Association for the Advancement of Science. The 1950 meeting was scheduled to be in Denver, Colo., during early September. Leonard S. Cottrell of Cornell university was to preside at the September meeting. (H. Bec.)

Sodality of Our Lady: *see* Societies and Associations.

Soekarno, Achmed (1900–), first president of the United States of Indonesia, was a radical nationalist and social reformer in Java while still in his 20s. In 1927 he fostered a nationalist movement which resulted in his being jailed. Released in 1932, he kept up his agitation until the Netherlands authorities in the East Indies exiled him to Flores Island, and later held him in Sumatra. He was freed when the Japanese swept across the islands in 1942, and he revived Indonesian nationalism, using the Japanese slogan of "Asia for the Asiatics." When the Dutch returned to Indonesia after the war, Soekarno and his forces declared their independence, and he proclaimed the Indonesian republic with himself as president, Aug. 17, 1945. Four years of warfare ensued, and even after a United Nations committee intervened to try to bring about peace, military violations by both the Dutch and Indonesians continued. In 1948 the Dutch opened full-scale attacks against the republicans, until the United Nations Security council called for a halt. Meantime, Dutch soldiers had again captured and exiled Soekarno. By Oct. 1949, the Dutch had reversed their severe stand against the republic, and approved its independence as an equal partner of the Netherlands under the Dutch crown. Soekarno was unanimously elected president on Dec. 16 and sworn in Dec. 17.

Softball. The U.S. men's championship tourney of the Amateur Softball association, played at Little Rock, Ark., was won by the Tip Top Tailors of Toronto, Ont., who defeated the Clearwater, Fla., Bombers, 3–1, in an 18-inning final for an undefeated tournament mark. Women's laurels were retained by the Phoenix, Ariz., Ramblers, who also went unbeaten in their competition at Portland, Ore.

The National Softball congress competition for men at Greeley, Colo., attracted 17 clubs, the Hanford Kings of California capturing the crown. The women's tournament at Phoenix was won by the Phoenix A-1 Queens, who regained the title they had won in 1947. (T. V. H.)

Soil Erosion and Soil Conservation. By 1949 there were movements in nearly all countries for control of soil erosion as a means to improve food-supply conditions. In addition, a worldwide survey of the incidence of soil erosion was begun by the Food and Agriculture organization (F.A.O.) of the United Nations, with funds supplied by the Conservation Foundation of the United States. Land areas were being grouped into three categories: little or no significant erosion; erosion that had moderately damaged production; and severe erosion that had seriously reduced production or made it impossible. The information would be made available in a series of continental maps patterned after the soil erosion map of the United States completed by the soil conservation service in 1947.

In some countries, difficulties had been encountered in setting up sound organizations for conservation work on the land before the necessary background information and data had been acquired. To deal with these difficulties more effectively, a chronology of eight basic steps in conservation organization procedure was presented by the United States to other nations at the United Nations Scientific Conference on the Conservation and Utilization of Natural Resources, held in New York city Aug. 17–Sept. 6:

1. Adoption of a national policy, preferably by legislation, to permit governmental guidance and participation in soil and water conservation.
2. Formation of a national soil conservation agency to operate under the national policy.
3. Initiation of soil and water conservation research in all natural physical areas, and interchange of knowledge on conservation methods as acquired.
4. The making of an over-all inventory of soil and water resources simultaneously with the starting of a research program.
5. The setting up of demonstrations, on a farm or watershed scale, to test conservation methods and enlist co-operation of farmers.
6. Decentralization of administration, with technical personnel so placed that they could work directly with landholders.
7. Provision for local farmer organizations to assume local leadership and active management of soil conservation programs within communities. (The soil conservation districts of the United States, Mexico, the Union of South Africa, Australia and New Zealand; the prewar conservancy districts of China; and the intensive conservation areas of Southern Rhodesia were examples of such local organizations.)
8. The building up and maintaining of a staff of trained soil conservation technicians to provide on-site assistance to individual farmers.

Reports received during 1949 showed that soil conservation work was being carried on in the following countries: Canada, Costa Rica, Cuba, El Salvador, Guatemala, Haiti, Mexico, Nicaragua, Panamá, Trinidad, United States, Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, Peru, Uruguay, Venezuela, Austria, Belgium, Cyprus, France, Germany, Great Britain, Greece, Italy, Portugal, Spain, U.S.S.R., Burma, China, India, Israel, Korea, Netherlands Indies, Pakistan, Philippines, Siam, Australia, New Zealand, Belgian Congo, French Equatorial Africa, Kenya, Northern Rhodesia, Southern Rhodesia, Sudan, Tanganyika, Union of South Africa.

United States.—During 1949, about 115,000 new soil conservation farm plans, covering more than 32,000,000 ac., were prepared by soil conservation service technicians working with farmers and ranchers in soil conservation districts. More than 22,000,000 ac. were given complete conservation treatment, and 26,000,000 additional acres were covered by detailed conservation surveys. As of July 1, a total of 740,000 farms covering 202,000,000 ac. had been planned for conservation treatment and use. Complete conservation plans were in operation on 668,322 farms totalling 185,000,000 ac. By Nov. 1, farmers and ranchers had organized 2,192 conservation districts covering more than 1,193,000,000 ac. and including 4,619,925 farms, of which 57,950 were in Alaska, Puerto Rico, the Virgin Islands and Hawaii.

Throughout the country, in co-operation with the experiment stations of all states, and also in Puerto Rico, the soil conservation service carried out many research investigations in specific areas. Outstanding results were reported in the use of legumes in combination with stubble mulching on croplands of Washington and Idaho; grass-legume cover crops in southern California's vineyards for wind-erosion and sand-drifting control; increased use of organic matter for tobacco lands of Maryland and North Carolina; and extension of the disk-pitting principles, formerly developed in Wyoming, into the arid range lands of Arizona as a seed-bed preparation treatment resulting in highly successful establishment of grasses on barren arid areas.

Fourteen additional states began Pittman-Robertson wildlife habitat improvement projects in co-operation with soil conservation districts, making a total of 35 states so engaged. The state wildlife agencies supplied planting stock, seeds and fencing materials to carry out wildlife-area provisions of farm conservation plans prepared by farmers with the assistance of soil conservation service field technicians.

An important aspect of the soil conservation program was the distinct trend toward grassland farming in many soil conservation districts. Completed conservation farm plans called for nearly 13,000,000 ac. of range and pasture seeding, more than 87,000,000 ac. of range and pasture improvement and large quantities of grass seed for use in crop rotations. Seed of scientifically tested conservation grasses continued in short supply, and for this reason the resources of the soil conservation service and hundreds of soil conservation districts were utilized to obtain larger amounts. Greatest success was in the harvesting of native grass seed from farm plots in northeastern Oklahoma and Texas. More than 5,000,000 lb. of the seed of native tall and mid-season grasses were harvested on these farms. The bulk of the harvest consisted of the bluestem, Indian grass and switch grass—the best grasses known for planting in areas subject to wind erosion. Tall, higher-yielding grasses also were in demand for conservation plantings in northern and southeastern states, where efforts were made to increase seed supplies of orchard grass, brome grass, timothy and the newly developed Kentucky-31 fescue or Suiter's grass. The Great Plains Agricultural council reported that by July 15, 1949, more than 10,200,000 ac. of formerly cultivated land in the Great Plains had been returned to grass.

Active flood control projects were carried out by the soil conservation service in co-operation with farmers and ranchers in 11 major watersheds during 1949: the Little Sioux in Iowa; the Yazoo and Little Tallahatchie in Mississippi; the Coosa in Georgia; Buffalo creek in New York; the Trinity and Middle Colorado in Texas; the Los Angeles and Santa Ynez in California; the Washita in Oklahoma and Texas; and the Potomac in Virginia, Maryland, Pennsylvania and West Virginia. Flood-control surveys also were under way or completed in 59 other watersheds, and plans had been prepared by soil conservation service technicians for 450 subwatersheds.

Heavy winter snows provided an outstanding test of the value of windbreak plantings in the Great Plains, and this combined with wider use of mechanical tree planters stimulated widespread planting in the autumn of the year. In the heart of the blizzard area, belts which had been properly planted and cared for not only kept snow from drifting over roads and around farmsteads, but trapped snow in and between belts for moisture storage in the soil. About 1,300 mi. of field windbreaks were planted in soil conservation districts in the fiscal year 1948–49. This brought the total planted through soil conservation planning since 1942 to approximately 7,000 mi. (80,000,000 trees).

Australia.—More than 100 soil conservation demonstrations had been established along the western slopes, in the tablelands and the Hunter valley and in other parts of the country. The areas varied from 300 to 1,000 ac., but there were several on which mechanical conservation work covered a more extensive area. Also, the demonstration program was extended by: (1) completion of about 90 smaller demonstrations in co-operation with farmers in the catchments of Keepit, Burrendong and Glenbawn dams, with limited financial assistance from the government; and (2) by introduction of an equipment-hire scheme to enable landholders to undertake larger conservation works which they could not normally carry out with their own equipment. Typical conservation practices applied through the equipment-hire scheme were diversion banks, silt traps, holding dams, grassed waterways, graded banks and pasture furrowing.

China.—An inspection was made early in 1949 of the Yellow river soil and water conservation experiment station and substations, at Tienshui, Kansu province, by technicians of the F.A.O. The station was found to be unaffected by war conditions, with conservation practices rapidly extending to farmland of the region. The problems of a large portion of the Yellow river watershed were reported to be the same as those dealt with at Tienshui, and the practices developed therefore could be used effectively over an immense territory. It was recommended that many similar stations should be set up at all strategic points as soon as possible to assist local people with their food-growing problems.

India.—A soil conservation program was begun in the state of Bihar, northeast India, in connection with the Damador Valley corporation, a conservation scheme similar to the Tennessee Valley authority in the United States. A large part of the valley was found to be in a serious state of erosion. There was urgent need for rehabilitation in the Tilaiya and Konar areas, where erosion was most advanced. Arrangements were being made for the inhabitants of these two areas to be resettled elsewhere before the flood season of 1950. Good vegetative cover was stressed in the initial stage of the program, with reforestation, the building of upstream dams, storage tanks and terraces, and grassland improvement also started. The upper catchment of the Damador valley, approximately 4,400,000 ac., was assigned to the soil conservation and land use department for rehabilitation. It was planned to base the conservation program largely on the ability of the cultivators in building terraces, together with their understanding of the value of compost and manure, and the great regenerative power of the native forests of the region.

Italy.—An intensive survey of the mountain pastures in central and southern Italy, Sicily and Sardinia was made in 1948 and 1949 by a range-management specialist of the U.S. soil conservation service, delegated by the F.A.O. for the work. A plan was drawn up for improvement of vegetative conditions and grazing practices, and for research needed to support a pasture improvement program for all Italy. It was found that, on the average, Italian mountain pastures were yielding only one-third to one-half of the forage that could be produced under conservation treatment and management. Italy already was carrying on extensive reclamation work, but much of the land that had been used for grazing and cultivation for centuries was found to be in urgent need of conservation treatment to preserve it and improve per-acre yields.

Philippines.—The division of soil survey and conservation, department of agriculture and natural resources, completed a reconnaissance survey of the erosion problem. The survey showed that of the 29,094,000 ac. of open and cultivated land in the Philippines, about 9,871,000 ac. were subject to severe erosion; 12,368,000 ac. were subject to all stages of erosion; and 6,855,000 ac., largely rice paddy, were not eroded or only slightly eroded. A total of 2,277,000 ac., mostly land cultivated by shifting cultivation and abandoned, should be reforested to save it from destruction by flooding and other damaging processes. During the year, the division of soil survey and conservation established the first soil conservation demonstration farm at San Ildefonso, Bulacan.

Southern Rhodesia.—A strong combined effort by farmers, the ministry of agriculture and the natural resources board to spread soil and water conservation to all parts of the country was started early in 1948 and carried on with remarkable effectiveness in 1949. The first step was formation of two new branches of the ministry of agriculture—the department of research and specialist services and the soil conservation and extension branch. A vigorous educational program was launched with a view to stimulating formation of intensive conservation areas (similar to soil conservation districts in the United States) and to train young men to act as conservation officers in the areas. By the end of 1949 there were 60 such areas, formed by farmer initiative and vote and served by conservation technicians, many of whom were recruited on completion of the conservation course for ex-servicemen at Witwatersrand university, Union of South Africa. Practices applied to the land included contour ridging, small dams and reservoirs, gully control, rotations including leguminous crops, reseeding of semi-arid grasslands, grazing management to allow establishment of native grasses, veld fire prevention, fencing of native pastures, and streambank structures and plantings to prevent further loss of bottomlands by flooding and cutting. Subsidies to 50% of cost were granted to landowners constructing dams in areas having less than 25 in. of rainfall. (*See* also Agriculture; Aqueducts; Dams; Irrigation; Meteorology.)

South Africa, The Union of. A self-governing dominion of the British Commonwealth of Nations. The four provinces of which it consists, the Cape of Good Hope, Natal, the Transvaal and the Orange Free State, extend from the southernmost point of the African continent to the Limpopo in the north. The former German colony of South-West Africa (area 317,725 sq.mi., pop. est. mid-1947: 370,000) is administered under mandate as an integral part of the Union, but this territory had not been incorporated as a province. Area: 472,550 sq.mi. (incl. Walvis Bay, 430 sq.mi.); pop. (mid-1949 est.): 12,111,800; (1946 census): 11,391,949 (Europeans 20.7%; native [Bantu] 68.7%; Asiatic 2.5%; mixed 8.1%). Official languages (European pop., 1946): Afrikaans (55.9%), English (39.9%). Religions: (European pop., 1946) Christian 95.5%, Jewish 4%; (non-European pop., 1946) Christian 51%, no religion 44%, remainder Hindu, Moslem and Buddhist. Chief towns (pop., 1946 census): Capetown (seat of legislature, 454,052, including 220,398 Europeans); Pretoria (seat of government, 236,367, including 130,180 Europeans); Johannesburg (727,743, including 332,026 Europeans); Durban (357,304, including 130,143 Europeans); Port Elizabeth (146,231, including 65,271 Europeans). Governor-general, 1949: Maj. Gideon Brand van Zyl; prime minister and minister of external affairs: Daniel François Malan.

SOUTH AFRICAN POLICE (left) dispersing a group of Negro rioters in Durban, during an outbreak of inter-racial hostility, Jan. 13-16, 1949, in which more than 100 persons were killed and more than 1,000 injured

History.—The year 1949 was notable for political controversy, racial feeling, economic difficulties and financial stringency in governmental, commercial and industrial circles. The Union parliament met on Jan. 26 and remained in session until early July. A 20% surcharge on both income and supertaxes was imposed. The estimated deficit for the year was £2,400,000, as against a surplus for the previous year of £7,500,000. In April the prime minister attended the commonwealth conference in London, dealing with the proposed change of status of both India and Ireland in the British Commonwealth of Nations.

In June two controversial measures were passed, the Citizenship act and the Mixed Marriages act. The former, ostensibly introduced in order to regularize the position of South African citizens consequent upon the new commonwealth status, in effect disfranchised about 45,000 recent settlers, who had emigrated to the Union in the belief that they would enjoy full rights of citizenship after two years of residence. In future, British and other commonwealth immigrants to South Africa would have to wait five years for citizenship and settlers from other countries six years. Even then their admission to citizenship would be entirely dependent upon the approval of their registration by the minister of the interior, who might refuse citizenship without assigning any reason.

The Mixed Marriages bill was introduced to make illegal all marriages between Europeans and people of other races. Public opinion, it was pointed out by the opposition, had already reduced these unions to no more than 77 out of 28,385 marriages in 1946.

In August the cabinet was reconstructed and the portfolios reapportioned.

Native Affairs.—Relations between Europeans and the other races of the Union deteriorated during the year. In January the Natives Representative council was dissolved. This body had not, in any event, met for two years. The secretary for native affairs made it clear that the government was not prepared to abolish discriminatory legislation, nor to give the council any executive authority over the development of the native reserves or the finances of native councils. It was, however, prepared to consider any reasonable suggestions for co-operation between the white and black races. Its intention was to encourage and develop the local council and *Bunga* system throughout the Union, with due regard to the ethnical and tribal situation of the several native peoples.

While parliament was still in session A. J. Stals, minister of education, said that grants to enable native children to obtain meals at school would be withdrawn. The opposition to this measure was so intense that it was subsequently modified. Although two conferences were held on the question of native housing, for which there was an estimated demand for almost 300,000 dwellings, little was settled. The municipalities, with some justice, claimed that they were in no position to finance the vast schemes required. Industry, on the other hand, showed extreme reluctance to pay any subsidy toward housing their native employees, without whom their factories could not function. Coupled with bad housing conditions, wages for native workmen were below proper subsistence level to such an extent that malnutrition, tuberculosis and venereal disease were rampant in many districts.

So serious were the results of this situation that, on facts given by C. R. Swart, the minister of justice, communism was said to be increasing its adherents among the native population at an alarming rate. Bad feeling on the whole position of the natives resulted in serious riots with loss of life at Durban during January and minor disturbances took place at Johannesburg, Krugersdorp and Randfontein later in the year.

Economic Position.—The most important events during 1949, in the economic sphere, were the ban on imports, because of the shortage of both sterling and dollars, and devaluation. Strict import control was imposed and certain goods were completely banned because South Africa had spent more than it could afford abroad. At the same time, after the nationalist government took office, much capital left the country; nor had it proved easy for the Union later to raise any large loans either internally or from Great Britain or the United States. Devaluation immediately improved the situation of the gold mines, whose output appreciated about £40,000,000 overnight, and many of the mines, regarded as marginal producers, began to show increased profits. Another consequence was the payment of 15% higher wages to mine workers both in the gold and coal industries.

The ban on imports, besides hitting commerce adversely, also struck at Union industries importing raw materials. Shortage of ready money affected the building industry, many workers becoming unemployed.

Education.—State schools (1947); Primary schools 1,190 (European 1,110), pupils 115,368 (European 92,291), teachers 3,927; secondary and high schools 241, pupils 75,339 (European 65,232), teachers 3,122; mission schools 3,036, pupils 386,054, teachers 9,421; other schools 99, pupils 3,031; training institutions 32 (European 9), pupils 3,790 (European 874), teachers 218. Private schools (1947): Kindergarten schools 92; primary schools 773; secondary schools 114; commercial and business schools 19; other schools 10. Pupils at all private schools 73,787 (European 36,500). Technical colleges (1946) 11, students 43,110, teachers 2,063. Universities (1946) 4 and constituent colleges of the University of South Africa 5, students 19,994, professors and lecturers, 1,743.

Finance and Banking.—Budget (in South African pounds): (1948–49) revenue 143,400,000, expenditure 135,800,000; (1949–50 est.) revenue 137,800,000, expenditure 140,200,000. National debt (March 1949): £(S.A.)662,100,000. Currency circulation (Aug. 1949): £(S.A.)63,600,000. Gold reserve (Sept. 1949): $121,000,000 U.S. Bank deposits (Aug. 1949): £(S.A.)287,900,000. Monetary unit: South African pound at par with the pound sterling, valued, at the end of 1949, at $2.80 U.S.

Foreign Trade.—(1948) Imports: £(S.A.)352,200,000. Exports, excluding gold bullion: (1948) £(S.A.)134,300,000.

Transport and Communications.—Licensed motor vehicles (Dec. 1948): cars 384,000, commercial vehicles 104,000. Railways: (1945) 13,480 mi.; passengers carried (1945) 218,000,000; freight ton-mi. (1948) 9,858,000. Telephones (1947–48): subscribers 206,493.

Agriculture and Fisheries.—Main crops (in metric tons, 1948): maize 1,800,000; wheat 477,000; oats 87,000; barley 43,000; rice (milled equivalent) 17,000; potatoes 303,000; peanuts 74,000; sugar (raw value) 533,000; tobacco 18,600; oranges and tangerines 180,000. Livestock: cattle (Aug. 1946) 12,593,000; sheep (Aug. 1946) 30,382,000; pigs (1945–46) 1,118,000; horses (1945–46) 687,000; chickens (Aug. 1947) 9,194,000. Wool production (in metric tons, on greasy basis, 1948–49): 99,000.

Industry.—(1947) Industrial establishments 11,886; persons employed 558,725 (Europeans 194,937); gross value of output £491,800,000; net value of output £225,100,000. Fuel and power (1948): coal (in metric tons) 23,558,000; electricity 9,259,000,000 kw.hr. Raw materials (in metric tons, 1948): iron ore, metal content, 1,163,000; pig iron 654,000; steel ingots and castings 599,000; copper 29,800. Gold (in fine oz., 1948): 11,585,000. Diamonds (in metric carats, 1948): 1,382,000. Cement (in metric tons, 1948): 1,308,000. Employment in manufacturing, including building (index on base 1937=100,1948): 156.

South Carolina. A south Atlantic state of the United States, eighth of the original 13 to ratify the constitution in 1788. It is known as the "Palmetto state." Area: 31,055 sq.mi., 461 sq.mi. being inland water; pop. (1940): 1,899,804; white, 1,084,308; Negro, 814,164; others, 1,332; 75.5% rural; 0.3% foreign-born. On July 1, 1949, the census bureau estimated the population at 2,001,000. Capital: Columbia (62,396). Other cities: Charleston (71,275); Greenville (34,734); Spartanburg (32,249); all these cities are greatly enlarged since these 1940 figures.

History.—The state house of representatives revised its rules in 1949 by reducing standing committees from 20 to 8, but failed to eliminate the filibuster. Hostility between regular Democrats and Dixiecrats somewhat hampered legislative efficiency. The sum of $300,000 was voted to establish a Negro girls' "industrial" school (reformatory). Constitutional amendments popularly ratified in 1948 abolishing the governor's pardoning power (except for commuting death sentences to life imprisonment) and permitting divorce for adultery, desertion, physical cruelty or habitual drunkenness were given final ratification by the legislature. A constitutional amendment abolishing the poll tax requirement for voting was adopted by the legislature, to be voted on by the people in 1950.

Attempts to shape primary election laws, entirely repealed several years before in the attempt to prevent federal court interference with the "white primary," were unsuccessful and that task was left to the legislature assembling in Jan. 1950, if the primaries were not to be conducted without any statutory regulation.

Application for admission to the municipally owned College of Charleston by a Negro caused the city council to give the college to private trustees, though they promised to continue the subvention for support, amounting, with that from the county, to half the college's income. The state was co-operating with nine other southern states in supplying outside their borders at public expense special advanced education for Negroes which their institutions did not supply.

The chief state officials of 1949 included: J. Strom Thurmond, governor; W. P. Blackwell, secretary of State (died Dec. 1949), ad interim appointee T. P. Bradham; Jeff B. Bates, treasurer; John M. Daniel, attorney general; E. C. Rhodes, comptroller general; Jesse T. Anderson, superintendent of education.

Education.—For the year ending June 30, 1949, enrolment in white elementary schools totalled 185,174, an increase of 5,949; in Negro elementary schools, 183,743, an increase of 5,713; in white high schools, 77,370, an increase of 5,242; in Negro high schools, 31,816, an increase of 2,389; total white and Negro teachers, respectively, numbered 10,061 and 6,704; expenditures for white schools, $38,545,974; for Negro schools, $12,604,686. Administration, vocational training and adult education on the school level consumed an additional $7,898,598.

Social Insurance and Assistance, Public Welfare and Related Programs.—In the year ending June 30, 1949, federal allocation for needy persons totalled $8,964,325, to which the state added $4,659,990. Assistance went to 43,533 aged persons, 1,745 needy blind, 28,847 dependent children and 6,450 persons needing general assistance, making a total of 80,575 persons assisted. The state unemployment trust fund totalled, June 30, 1949, $52,354,992. Payments during the fiscal year then ending (duplicate names not eliminated) went to 52,291 applicants and totalled $7,833,905. Patients in the state hospital (for mentally diseased), June 30, 1949, totalled 5,095; in the school for feeble-minded, 972; prisoners in penitentiary and state farms, 1,413; in reformatory for white boys, 217; in Negro boys' reformatory, 182; in white girls' reformatory 107.

Communications.—Paved highways, June 30, 1949, amounted to 10,398 mi.; miles under state highway department, 19,323; highway funded debt, $62,924,000. The gasoline tax yielded $19,135,257; licences, $4,473,067; bond sales, $15,000,000. Federal aid amounted to $4,652,799 of the $44,200,109 revenues for highways. Railroads measured 3,563 mi. Eastern, Delta, National and Southeastern air lines cross the state.

Banking and Finance.—On June 30, 1949, there were 25 national banks, plus 25 branches; 102 state banks, plus 10 branches, with capital account, deposits and resources, respectively, as follows: national, $21,960,000, $384,053,000, $407,871,000; state banks and depositories, $18,706,325, $233,764,993, $252,859,105. Resources of the 32 federal building and loan associations totalled $76,584,161; of the 40 state associations, $28,853,057. The general appropriation act for year ending June 30, 1950, totalled $112,854,709. The state debt, June 30, 1949, totalled $66,275,098 ($62,924,000 being for roads). Federal income taxes year ending June 30, 1949, totalled $179,201,118; other federal internal revenues, $25,644,826. Exports totalled $63,100,000; imports, $15,900,000; duties on imports $1,115,830.

Agriculture.—The chief field and truck crops for the year 1949 were valued at $274,908,000, being 19% less than 1948 values, chiefly because of the small cotton crop and lower prices. Harvested acreage was about 4,400,000.

Table I.—*Leading Agricultural Products of South Carolina*

	1949	1948	Average, 1938-47
Corn, bu.	31,590,000	28,360,000	25,235,000
Wheat, bu.	1,930,000	3,332,000	3,029,000
Oats, bu.	16,484,000	12,144,000	15,462,000
Barley, bu.	518,000	473,000	434,000
Rye, bu.	86,000	76,000	172,000
Hay, tons	484,000	461,000	441,000
Irish potatoes, bu.	1,650,000	1,408,000	2,684,000
Sweet potatoes, bu.	4,800,000	4,284,000	5,430,000
Tobacco, lb.	147,630,000	131,560,000	117,124,000
Cotton, bales	560,000	871,000	716,000
Cotton seed, tons.	226,000	359,000	288,000
Peaches, bu.	2,490,000	3,160,000	3,671,000
Pecans, lb.	2,700,000	3,600,000	2,309,000
Peanuts, lb.	14,300,000	18,200,000	17,332,000

Manufactures.—The value of manufactures for the year ending June 30, 1949, was $1,701,838,522, against $1,797,461,287 for the previous year. Employees numbered 173,926 against 179,859 the year before. Total capital in manufactures was $736,547,207, against $583,866,964 the year before.

Mineral Products.—Mineral products, chiefly stone and clays, especially granite and kaolin, for the year totalled in value $9,727,287, as against $8,497,129 the year before. (D. D. W.)

Table II.—*Products of Principal Industries of South Carolina*

	Year ending June 30, 1949	Year ending June 30, 1948
Textiles (including knitting)	$1,175,337,135	$1,293,547,124
Lumber products (barrels, boxes, baskets, veneering, paper and pulp, furniture, woodwork)	118,876,202	126,918,753
Electricity	42,594,385	37,604,244
Clothing	62,760,486	50,475,771
Fertilizers	35,921,923	31,962,824

South Dakota. A north-central state of the United States, admitted as the 40th state on Nov. 2, 1889, South Dakota is popularly known as the "Coyote state." Area: 77,047 sq.mi., of which 511 sq.mi. are water; population (1940): 642,961, with 158,087 listed as urban and 484,874 as rural; Indian population 23,347. The federal bureau of the census estimated the population on July 1, 1949, at 649,000. The state census taken during 1945 revealed a population of 589,920. Capital: Pierre (4,218 in 1945, according to state census). Principal cities with 1945 census figures: Sioux Falls (42,343), Aberdeen (18,103), Rapid City (17,262), Huron (11,146) and Mitchell (9,894).

History.—The Pick-Sloan plan for the comprehensive development of the Missouri river basin continued as the main topic of public discussion during 1949. This project includes four multiple-purpose dams on the main stem of the Missouri within South Dakota and the construction of seven reservoirs for the irrigation of approximately 900,000 ac. Construction on the Fort Randall dam near the Nebraska boundary line was started on July 30, 1946, and on the Oahe dam, 7 mi. N. of Pierre, on Sept. 16, 1948. The dedication of the Angostura dam on the Cheyenne river in the southwestern corner of the state on Sept. 29, 1949, marked the practical completion of the first irrigation reservoir.

Record-breaking appropriations totalling $42,592,918 were authorized by the legislature which closed its 60-day session on March 4, 1949. A major legislative problem concerned the payment of the $30,000,000 veterans' bonus approved by the voters in Nov. 1948. Measures enacted to provide the necessary funds included a direct appropriation of $7,800,000, a two-mill state property tax, a 3% sales tax on liquor and cigarettes and an increase in the state sales tax from 2% to 3%.

State officials during 1949 included: George T. Mickelson, governor; Rex Terry, lieutenant governor; Sigurd Anderson, attorney-general; Annamae Riiff, secretary of state; Clarence E. Buehler, treasurer; and Harold S. Freeman, superintendent of public instruction (elected on nonpartisan ticket).

Education.—The school census, ages 6–21, was 155,935 in 1948–49, compared with 154,780 in 1947–48. The enrolment was 86,478 in elementary schools and 28,401 in high schools. Total expenditures were $23,852,762.

Social Insurance and Assistance, Public Welfare and Related Programs.—During the calendar year 1948 the state department of social security distributed $4,887,754 among 12,026 persons in old-age assistance; $1,021,251 to 1,804 families as aid to 4,505 dependent children; and $78,678 for the needs of 210 blind persons. Eight penal and charitable institutions were in operation on a legislative appropriation of $2,289,699 for the fiscal year 1948–49.

Unemployment benefit payments during 1948 amounted to $293,123 at an average weekly rate of $15.99. Readjustment allowances paid to unemployed veterans totalled $910,000.

Communications.—The state in 1949 maintained a highway system of 6,213 mi., including 3,255 mi. of pavement and 2,958 mi. of gravel surface, at a cost of $5,153,376. There were 3,967 mi. of railroad in operation in 1949. Telephones in use Jan. 1, 1949, numbered 139,647, of which 39,673 were classified as rural.

Banking and Finance.—There were 35 national banks in operation on Dec. 31, 1948, with total assets of $275,856,000 and total deposits of $262,505,000. The 135 state banks and trust companies on June 30, 1949, had resources of $245,551,535 and deposits of $230,892,452. Nine building and loan associations on June 30, 1949, reported total resources of $5,018,610.

Total receipts for the state treasury for the fiscal year ending June 30, 1949, were $59,441,623; disbursements were $56,315,053. The bonded indebtedness was $17,199,000. Federal internal revenue collections for the same year totalled $64,055,105, of which amount $55,802,858 was derived from the income tax.

Agriculture.—Cash farm income for 1949 was estimated to be 19% below the 1948 figure of $645,995,000. Production of all the major crops declined considerably during the year, primarily as a result of midsummer drought and high temperatures during August.

Principal Agricultural Products of South Dakota

Crop	1949	1948	Average 1938–47
Corn, bu.	82,824,000	131,472,000	79,028,000
Wheat, bu.	34,276,000	50,391,000	37,530,000
Oats, bu.	67,988,000	104,252,000	77,963,000
Barley, bu.	14,958,000	34,914,000	33,186,000
Flaxseed, bu.	4,956,000	7,788,000	3,069,000
Potatoes, bu.	1,008,000	2,750,000	2,390,000
Hay, all, tons	2,939,000	3,443,000	2,939,000

Mining.—The total value of mineral substances produced in 1948 was $19,444,445. The state ranked second in gold production, valued at $13,224,750; second in bentonite, valued at $2,047,000; and third in feldspar, valued at $616,239. The state-owned cement plant produced 698,101 bbl. of cement, valued at $1,815,062. (H. S. S.)

Soybeans. The 222,305,000-bu. U.S. soybean crop of 1949 was the second largest on record, only slightly less than the 223,006,000-bu. crop of 1948 and much in excess of the 1938–47 average of 148,381,000 bu. Harvested acreage in 1949 of 9,912,000 was low compared with 10,430,000 ac. in 1948, but above the ten-year average of 8,025,000 ac. Yields in 1949 were the highest on record at 22.4 bu. per acre. Illinois produced about one-third of the crop, 82,602,000 bu.; Indiana was in second place with 33,166,000 bu.; and Iowa followed with 28,778,000 bu.

Average prices received by farmers for soybeans fluctuated erratically during the year, although at levels far below the 1948 peak as the supply-demand situation in fats and oils eased materially. The average price to farmers for the 1949 crop was preliminarily estimated at $2.08 per bushel, slightly less than the government support price of $2.11 per bushel.

World soybean production in 1949, estimated at 501,700,000 bu., was 10% smaller than the record 1948 crop of 558,400,000 bu., but exceeded the 1935–39 average of 464,300,000 bu. China's production of 179,200,000 bu. was 15% less than in 1948, and the Manchurian crop of 66,000,000 bu. was less than half of the average prewar harvest. (J. K. R.)

Spaak, Paul-Henri (1899–), Belgian prime minister, was born on Jan. 25 in Brussels. He practised law in Brussels and was elected to the chamber of deputies as a Socialist. He joined Paul van Zeeland's cabinet as minister of posts and telegraphs in 1935 and was foreign minister a year later. He conducted the negotiations to secure Belgium's release from the Locarno and the Anglo-Franco-Belgian agreements, then believing that Belgium could remain neutral in the event of war. He was prime minister from May 1938 to Feb. 1939 and at the outbreak of World War II again became foreign minister. In May 1940, after the capitulation of the Belgian army, he went to France and later to England, where he became foreign minister in the Belgian government-in-exile. In Feb. 1945, he was retained as foreign minister in the Van Acker government, established in Brussels. He was elected president of the first general assembly of the United Nations (London, 1946).

Prime minister of a government formed from a Christian Social and Socialist coalition from March 19, 1947, he resigned after the election of June 26, 1949 (*see* BELGIUM). After the formation of a Christian Social and Liberal coalition government by Gaston Eyskens on Aug. 10, the following day Spaak was appointed minister of state by the regent. Also on Aug. 11, at Strasbourg, he was elected president of the first European assembly.

Spain. A country of southwestern Europe, Spain is bounded on the north by the Bay of Biscay and France, on the south and east by the Mediterranean. Area: 194,945 sq.mi., including Balearic (1,936 sq.mi.) and Canary Islands (2,804 sq.mi.). Pop. (1940 census): 25,877,971, (1948 est.) 27,761,000, including Balearic (1940 census: 407,497) and Canary Islands (680,294). Religion: mainly Roman Catholic. Chief towns (pop., 1947 est. if not otherwise stated): Madrid (cap., 1949 est., 1,440,041); Barcelona (1949 est., 1,500,000); Valencia (562,967); Seville (382,013); Zaragoza or Saragossa (292,965); Málaga (277,582); Murcia (226,702); Bilbao (220,333). Chief of state and prime minister: General Francisco Franco (*q.v.*).

History.—In a press interview at the end of Jan. 1949 Gen. Franco spoke of the United Nations as having been born in an atmosphere of passion and as having "employed Spain as a means of paying out appeasement money to the aggressors of the future." Until the international climate became more propitious, Spain was not interested in whether or not it was admitted to membership. Although a share in the European Recovery program would naturally be welcome, it had made no approaches whatever in this sense, either direct or indirect, to the United States. Gibraltar, though now of little military value, would always, while it remained British, constitute a shadow in Anglo-Spanish relations. Gen. Franco would make no statement about the prospect for a restoration of the monarchy and held out scant hope of an early return to parliamentary democracy.

KING ABDULLAH of Jordan (left) and Gen. Francisco Franco (centre) reviewing a military parade during Abdullah's visit to Spain in Sept. 1949

The Security council of the U.N. approved on April 28 by ten votes to none, U.S.S.R. abstaining, an Australian resolution for the appointment of a subcommittee of five to enquire into the complaint that the Franco regime had led to international friction and was a threat to international peace and security and to suggest practical measures for ending it: Australia, Brazil, China, France and Poland were chosen. In May a motion to restore to member states of the U.N. full freedom of action in their diplomatic relations with Spain was carried in the political committee by 25 votes (chiefly Latin American and Arab) to 16, with 16 abstentions but failed by four votes to get the necessary two-thirds majority in the full assembly, where the voting was 26 to 15, again with 16 abstentions, among them Great Britain, France and the U.S. The consulates general in Barcelona of Brazil, Peru and Bolivia, the three states which, with Colombia, had tabled the resolution, were simultaneously damaged by bombs on May 15. A Polish resolution proposing sanctions was lost by 6 votes to 40, 7 abstaining.

Diplomatic relations between Spain and Venezuela had been renewed in April, when notes to the same purpose were exchanged with Liberia.

On May 18, in a long opening address to the third legislative session of the *cortes* (parliament) in Madrid, Gen. Franco accused Great Britain of having failed to keep promises made to Spain in 1941 that after the war Great Britain would further Spanish territorial claims in North Africa at the expense of France, and further alleged an Anglo-American intention in 1944 to open the second front in the Iberian peninsula, which was only defeated by "soviet realism." Gen. Franco stated that he was not greatly interested in the countries of Europe, which were driving Spaniards "in the direction where our heart impels us—to Hispanic America." But, "if our hearts lead us toward Spanish America, the force of reality impels us toward North America."

Authorized by the state department in May to negotiate directly with the Export-Import bank for a government loan, Spain, represented by Andrés Moreno, director of the Banco Hispano-Americano, was reported to have asked in Washington for $1,250,000,000, or $400,000,000 more than the bank's entire treasury assets. The application was refused. Earlier, in February, the Chase National bank of New York had granted a short-term loan of $25,000,000, the first substantial credit advanced to Spain by a U.S. commercial bank for many years. Four-fifths of the loan was to go to buying the U.S. out of the Spanish telephone system.

The Spanish government had been consulted by Portugal in March concerning the invitation to the latter to adhere to the North Atlantic treaty, such consultation being called for by the treaty of friendship and non-aggression of 1939 and the protocol to this of 1940, and had intimated that it raised no objection. King Abdullah of Jordan paid a fortnight's visit to Spain in September. An official statement issued jointly by the foreign ministers of the two countries at the conclusion of the visit recorded complete agreement on the seriousness of the menace of communism to world peace.

The statutes of the council of the kingdom created by the law of succession of July 26, 1947, were published by decree on Jan. 1. This supreme consultative body of 14 members—seven *ex-officio* (the president of the *cortes*, the senior prelate in the *cortes*, the senior captain general, the senior general in the *alto estado mayor* of the forces, the president of the council of state, the president of the supreme tribunal of justice and the president of the Institute of Spain), four elected by the *cortes* and three nominated by the chief of state, with the president of the *cortes* as chairman—was to advise the chief of state in major matters of his exclusive competence such as the declaration of war or making of peace, the choice of a successor as head of the state, abdication of any kind, royal marriages and the depriving of royal personages of any rights of succession on grounds of lack of capacity or "notorious deviation from the fundamental principles of the state."

Elections for the provincial *diputaciones* were held on March 20, candidates being chosen partly from representatives of the town councils, partly from economic, cultural and professional corporations. New facilities for crossing the Gibraltar frontier were announced in May.

Spain's internal economy suffered greatly from a drought even more severe than those of the two previous years, householders and public services being among those affected by the repeated and prolonged water and electricity cuts. Catalan industry was particularly handicapped by the hydroelectric shortages, as too by reduced imports of raw cotton and other materials. Lack of fertilizers and tractors combined with the drought to weigh heavily on agriculture, the grain harvest falling short of consumption needs by 1,500,000 tons.

In the Canary Islands the summer was marked by a series of severe volcanic eruptions on La Palma. Streams of lava, that formed a substantial promontory in the sea, cut off an area in the south of the island and caused several villages to be evacuated. The shocks continued for six weeks, as many as 80 tremors being registered in one day.

National expenditure for 1950 was estimated in November at 17,941,000,000 pesetas and revenue at 17,848,000,000 pesetas. The raising of a loan was authorized to cover the deficit. In a press interview Gen. Franco stated that Spain's internal economic needs were not great but that assistance was necessary for defense purposes.

The first entirely Spanish-built transport aircraft made its trial flight in March. A new type of "articulated train," the invention of a Basque military engineer, Alejandro Goicoechea, was on test during the summer after undergoing preliminary trials in the U.S.

A new one-year trade program between Spain and Great Britain, concluded in June, envisaged some increase in value of trade between the two countries and an easing of conditions. Acceleration in the import of U.K. manufactured goods and in financial-debt transfers was announced in December after further discussions of outstanding trading difficulties.

An agreement was signed with the Benelux countries in April for a trade exchange totalling about 1,500,000,000 Belgian francs, Spain to receive electrical plant, rolling stock and heavy industrial equipment against Spanish manufactured goods and other products. A trade treaty was also concluded with Denmark in May; and in June the trade and payments agreement with France was renewed for a further year, French exports to include coal, phosphates, rolling stock and electrical plant equipment. Following on the devaluation of sterling, Spain decided in October to maintain its basic exchange rate at 10.95 pesetas to the U.S. dollar. (W. C. AN.)

Education.—State schools (1946–47) 54,055, pupils 4,359,230, teachers 55,077; secondary schools (1947) 118, pupils 203,136; training colleges for elementary teachers (1947) 53, students 25,928; universities (1947) 12, students 42,597, professors and lecturers about 3,000. Illiteracy (1947): 20.8%.

Transport and Communications.—Roads (1949): 75,000 mi. Licensed motor vehicles (Dec. 1948): cars 94,654, commercial vehicles 58,187. Railways (1947): 10,920 (7,950 government owned) mi.; passenger traffic (government-owned lines) 109,503,212. Shipping (July 1948): number of merchant vessels of 100 tons and upwards 1,084; total tonnage 1,155,267. Telephones (Dec. 1947) 481,929.

Finance and Banking.—Budget (1947, actual) revenue 12,964,000,000 pesetas, expenditure 14,223,000,000 pesetas; (1948 est.) revenue 15,115,000,000 pesetas, expenditure 15,196,000,000 pesetas. National debt (Jan. 1948): 52,953,000,000 pesetas. Currency circulation (Aug. 1949): 25,300,000,000 pesetas. Gold reserve (Aug. 1949): $85,000,000 U.S. Bank deposits (June 1949): 32,000,000,000 pesetas. Monetary unit: peseta with a basic exchange rate (Dec. 1949) 10.95 pesetas to the U.S. dollar.

Foreign Trade.—Imports (1948) 1,439,000,000 pesetas; exports (1948) 1,106,000,000 pesetas. Principal imports: wheat, machinery and vehicles, raw cotton, fuel and bananas. Principal exports: oranges, tomatoes, cotton goods and iron ore and pyrites.

Agriculture and Fisheries.—Main crops (in metric tons, 1948): wheat 3,266,000; barley 1,742,000; oats 550,000; rye 508,000; maize 560,000; potatoes 3,000,000; rice 272,000; cottonseed 12,000; sugar, raw value, 265,000; cotton, ginned, 6,000; wool on greasy basis, 35,000; tobacco (leaf) 13,800. Olives (1946) 2,070,000 metric tons; oranges and lemons (1947) 876,000 metric tons. Livestock (1947): cattle 3,100,000; sheep 24,120,000; pigs 5,000,000; horses 600,000; mules 1,080,000; asses 800,000; goats 6,100,000; fowls (1945) 22,876,000. Fisheries: total match (1947): weight 567,841 metric tons; value 2,032,000,000 pesetas. Production (1948): wine 14,200,000 hectolitres; olive oil (1947) 362,000 metric tons.

Industry.—Fuel and power (1948): coal 10,410,000 metric tons; lignite 1,394,000 metric tons; manufactured gas 8,257,000 cu.ft.; electricity 6,110,000,000 kw.hr. Raw materials (in metric tons 1948): iron ore, metal content, 1,632,000; pig iron 517,000; steel ingots and castings 548,000; black and blister copper 8,900; lead 22,000; zinc 21,200. Other products (in metric tons): rock salt (1947) 265,000; potash ore (1947) 622,000; cork (1946) 70,000; paper (1946) 165,000. Cement production (1948) 1,646,000 metric tons.

FILMS OF 1949.—*Iberian Peninsula; Spanish Children* (Encyclopædia Britannica Films Inc.); *Spain: The Land and the People* (Coronet Instructional Films).

Spanish-American Literature.

Three factors continued in 1949 to impede the fullest development of creative literature in Spanish America: (1) the high price of publishing books, greatly increased by postwar inflation; (2) political instability which had made the position of the writer insecure and in many cases had driven him into exile; (3) the increasingly evident preference of the reading public for translations of European and North American authors rather than for original works by Spanish-American writers. In spite of these discouraging facts good books continued to appear in Spanish-speaking America.

While a few of the older and established generation of novelists continued to write, 1949 saw the publication of a number of works of fiction by newer writers of diverse tendencies. Among the former, two Mexican novelists of recognized reputation produced praiseworthy works: *Sendas perdidas* by the veteran Mariano Azuela, and *Cabello de elote* by Mauricio Magdaleno, whose *Sunburst* was already known to the English-speaking world in translation. Other distinguished novels of the year included *En medio del camino de la vida,* an autobiographical tale by the Colombian essayist Germán Arciniegas; *El Reino de este mundo,* a beautifully conceived novel of Haitian folklore by the Cuban author Alejo Carpentier; and Marta Brunet's poetic work, *Raíz del sueño,* which continued the Chilean novelist's tradition of fine style.

Less striking but of considerable value in tracing the complex development of the novel in Spanish-speaking countries were the following: *Fogarada,* by Enrique González Rincones, a story of the Venezuelan oil fields; *Una Noche en Acapulco,* by the Mexican Rodolfo González Hurtado, in which adventure and fantasy combine in agreeable proportions; *El Holandés volador,* a whimsical treatment of an old theme by the Chilean Ernesto Silva Román; *La Fuga de la quimera,* an imaginative tale by the prolific Mexican littérateur Carlos González Peña; *Aventuras de un bracero,* an interesting account of the life of a Mexican itinerant labourer in the United States by Jesús Topete; *Evocación,* a novel of the older local-colour tradition by a Venezuelan, Pedro César Dominici.

The short story and novelette figured prominently in the year's literary output. Two Argentine collections, *Los Usurpadores* by Francisco Ayala and *El Aleph* by Jorge Luis Borges, were of exceptional interest because of their urbane and somewhat satirical subtlety. Also in the imaginative tradition were tales entitled *Los Cuentos que Nueva York no sabe,* by the Dominican author Angel Rafael Lamarche. Considerably more earthy were the stories of two young Venezuelans, Manuel Trujillo, *Cuatro cuentos rurales,* and Ramón Díaz Sánchez, *La Virgen no tiene cara y otros cuentos.*

As usual it was impossible to keep account of the hundreds of books of poetry which appeared in 1949. Two among them were of unquestioned importance: *Sonetos,* by the brilliant Mexican poet and statesman Jaime Torres Bodet; and *Poesías completas,* the collected works of the much-lauded Peruvian César Vallejo. Colombia, long the home of famous poets, produced among many other volumes of verse an *Antolología de la nueva poesía colombiana,* representing the experimental work of about 37 moderns, and *La Poesía en el Valle del Cauca,* which included excellent samples of the older and of contemporary regional verse.

Not since colonial days had the drama been a thriving genre in Spanish America, and 1949 provided no exception to the rule. Two dramas might be mentioned as indicative of tendencies: "*. . . de campanario o de Macolatlán,*" a three-act poetic play by a Mexican author J. Jesús Castorena; and a volume of two plays by an older Venezuelan writer Pedro César Dominici: *El Hombre que volvió* and *La Casa,* both of which showed somewhat romantic and old-fashioned characteristics.

Among biographies written by Spanish-American authors the following were noteworthy: *Sarmiento y su americanismo,* by the Cuban scholar Emeterio Santovenia; *El Misterioso almirante y su enigmático descubrimiento,* a novel interpretation of the personality of Christopher Columbus by Carlos Brand (Venezuelan); *De mi vida y otras vidas,* autobiographical recollections of the grand old man of Colombian letters, Baldomero Sanín Cano; and a new appraisal of the life of Juan Manuel Rosas by the Argentine novelist Manuel Gálvez.

The year was notable for the appearance of a number of outstanding works of literary criticism, the majority of which were published in Mexico. Of superior quality was *Las Corrientes literarias en la América Hispánica,* by the recently deceased Pedro Henriquez Ureña. Leopoldo Zea's *Romanticismo y positivismo* was a stimulating study of philosophical and literary trends in the 19th century. Students of contemporary Mexican literature appreciated José Luis Martínez's scholarly *Literatura mexicana: siglo XX,* and the systematic student found Julio Caillet-Bois's *La Literatura hispanoamericana,* published in Buenos Aires, Arg., a comprehensive guide. Two notable volumes concerning *modernista* poetry were Arqueles Vela's *Teoría literaria del modernismo* and Manuel Serrano Blanco's *Guillermo Valencia.* Important studies of regional literature included Rubén Sueldo Guevara's *Panorama actual de la literatura Cuzqueña,* Alfonso de Alba's *La Provincia oculta* (Mexican) and Francisco Key Ayala's *Bajo el signo del avila* (writers of Caracas, Venez.).

The list of critical works on national literatures was enriched with the publication in 1949 of José A. Fernández de Castro's *Esquema histórico de las letras en Cuba (1548–1902)* and Pedro Díaz Seijas's *Orientaciones y tendencias de la novela venezolana.*

A number of the more important literary landmarks of 1949 would be classified as essays or general works, and in them one often found Spanish-American writers at their best. Félix Lizaso's *Panorama de la cultura cubana* provided an excellent survey of a relatively unknown field. *El Problema del indio en América,* by Aída Cometta Manzoni, whose previous studies of the Indian in literature had given her authority, was an illuminating series of five essays. Vincente Sáenz's *Hispanoamérica contra el coloniaje* exemplified in a polemic vein the intense nationalism of contemporary Latin America, and *El Futuro de América* by an Ecuadoran Juan Yépez del Pozo dealt with similar themes. Two volumes of art history were outstanding: Manuel Toussaint's *Arte colonial en México,* and José María Vargas' *El Arte Quiteño en los siglos XVI, XVII y XVIII.*

The quantity and quality of essays on folklore constituted a noteworthy characteristic of the 1949 production of books. Representative of this type of literature were *Música y danzas del Ecuador,* by Segundo Luis Moreno; *El Valor sociológico del folklore y otros ensayos,* by Lucio Mendieta y Núñez; *Cultura y folklore en América,* by E. de Gandía; and *Cantos del Valle de Tenza* (Colombia), compiled by Joaquín R. Medina.

(J. T. R.)

Spanish Colonial Empire. Under this heading are grouped the Spanish possessions in Africa. Their total area is approximately 134,763 sq.mi. and the total population (1948 est.) 1,537,000. Certain essential information on the territories composing the empire is given in the table.

History.—The wedding of Muley Hassan Ben el Mehedi, the khalifa (viceroy) of the Spanish zone of Morocco to his second cousin, daughter of the former Sultan Abd-el-Aziz, in June 1949 was celebrated by three weeks of festivities described as on an Arabian Nights scale, that cost about 11,000,000 pesetas. Lieut. Gen. Juan Varela, the Spanish high commissioner, presented the khalifa with a check for 1,000,000 pesetas from General Franco. The khalifa and General Varela travelled to Granada in September to meet King Abdullah of the Hashemite Kingdom of Jordan, who placed on record his appreciation

Spanish Colonial Empire

Country	Area (in sq.mi.)	Population (1948 est.)	Capital and Status	Foreign Trade	Transport and Communications	Budget
Spanish Morocco	17,631	1,140,000 (incl. 62,438 Spaniards and 14,734 Jews)	Tetuan; protectorate; *High commissioner:* Gen. Juan Varela; *Khalifa (viceroy of the sultan of Morocco):* Sidi Muley Hassan Ben el Mehedi	(all possessions, in gold pesetas) (1945) imp. 125,383,000 exp. 197,736,000 (1946) imp. 150,307,000 exp. 217,379,000	roads c. 500 mi. railway 80 mi. shipping (1943) entered 307,379 net registered tons	rev. and exp. *Excluding nomads.

of Spain's conduct of affairs in Morocco. Among the bases of Spanish policy, as enumerated by General Franco in his opening speech to the Madrid *cortes* in May, were "friendship and affection" for the Arab peoples. The Spanish government placed a number of aircraft at the disposal of Moslems for their pilgrimage to Mecca. (W. C. An.; X.)

Spanish Literature.

Though some of the best critical work of the year 1949 came from Spaniards living abroad (*e.g.*, Pedro Salinas' study of *Rubén Darío*, Enrique Moreno's of *Guzmán de Alfarache* and Joaquín Casalduero's of *Don Quijote*), there was also much activity in Spain. A valuable linguistic study was M. Criado de Val's *Sintaxis del verbo español moderno.* The middle ages were represented by the first volume of Martín de Riquer's *La Lírica de los trovadores,* E. Alarcos' *Investigaciones sobre el libro de Alexandre* and José Romeu Figueras' *El Mito de "El Comte Arnau."* Outstanding works on the 16th century were E. Segura Covarsi's *La Canción petrarquista en la lírica española del Siglo de Oro,* Rafael Lapesa's *La Trayectoria poetica de Garcilaso* and Ramon Carande's *Carlos V y sus banqueros: La Hacienda real de Castilla.* Figures in the Romantic era who received full-length studies were La Avellaneda (M. Ballesteros), Nicomedes Pastor Díaz (E. Chao Espina), Gregorio Romero Larrañaga (J. L. Varela) and Vital Aza (N. Alonso Cortes). Of the moderns, Federico Garcia Lorca was the subject of a monograph by G. Díaz-Plaja, and R. Gullón and J. M. Blecua wrote on *La Poesía de Jorge Guillen.* Two notable events in Madrid were the compilation of a series of "Homenaje" volumes celebrating the 80th birthday of Ramón Menéndez Pidal, and the foundation of the Instituto de Humanidades by José Ortega y Gasset and Julián Marías; a course given there by the latter was published as *El Método histórico de las generaciones.* The *Revista de Occidente* published a comprehensive *Diccionario de literatura española.*

Foremost among the year's novels were S. J. Arbó's *Sobre las piedras grises,* awarded the Premio Nadal, J. A. de Zunzunegui's *La Ulcera* (Premio Nacional de Literatura), Benjamin Jarnés' *Eufrosina,* Enrique Azcoaga's *El Empleado* and the *Doña Juana la Loca y otras seis novelas superhistóricas* of Ramón Gómez de la Serna, who returned to Spain. Collections of verse included Leopoldo Panero's *Escrito a cada instante,* Luis Rosales' *La Casa encendida,* Leopoldo de Luis' *Los Imposibles pájaros* and José María Valverde's *La Espera.* The 1949 Premio Lope de Vega for drama was awarded to Antonio Buero for his *Historia de una escalera.* Notable new literary reviews were *Alcantara* (Extremadura), *Alma* (Madrid) and *Proel* (Santander). Literary men elected to the Spanish Academy of the Language were Vicente Aleixandre and Salvador González Anaya. (E. A. P.)

Special Libraries Association: *see* LIBRARIES.

Spices.

Pepper prices during 1949 reflected the scarcity of this commodity in the world markets. Prices at Rotterdam, Neth., London and New York city ranged up to $1.42 per pound for black pepper and $2.40 per pound for white pepper. Supplies from Indonesia, normally the largest source, continued to be shut off, but India, with a larger crop than usual, maintained a well-exploited monopoly and in November raised the export tax to about 12 cents per pound. Imitation pepper made by grinding grain with cayenne and esculent oils reappeared on the market to ease the situation.

The United States and Canada reported good harvests of mustard seed, while European production was reduced to make more land available for the planting of root crops and cereals. China did not report its crop, which at times had exceeded 11,000,000 lb. from provinces which had fallen under Communist control.

Dry weather and labour problems shortened production of ginger and caused prices to rise 350% above normal; plans were laid for larger plantings in Jamaica, Sierra Leone, India and Nigeria, the principal sources of supply.

Batavia, Korintje and Saigon varieties of cassia (cinnamon) were obtainable from Indonesia and Indo-China despite continued warfare during 1949. In China the harvesting of the different varieties of cassia continued, distribution being effected through British-controlled Hong Kong.

Madagascar and Zanzibar cloves were available during the year but shipments were smaller because of unfavourable conditions. Prices exceeded those of 1948. Shipments of nutmegs and mace from certain East Indian Islands were uninterrupted. A fine crop in Grenada (British West Indies) balanced supply with demand.

Production of red pepper (chilies) was less than normal and prices were high. The scarlet Hontaka and Takanotsume pods reappeared from Japan, at prices up fourfold. Cayenne from Africa sold at high prices as did Mexican "Anchos" for chile con carne.

Yugoslavia and Chile exported fine-quality paprika, supplementing Spanish and Portuguese supplies, and prices were moderate.

The world supply of herbs was affected by political disturbances in Europe, principally in Yugoslavia, the source of the preferred sage (*Salvia officinalis*). Bay leaves posed a dilemma, satisfactory quality (*Laurus nobilis*) being obtainable only from Greece, where the crop was neglected.

Supplies of caraway, poppy, dill, coriander and cummin seeds were available from Europe and North Africa. Sesame had become a successful crop in Nicaragua.

Tumeric, formerly obtainable only from India, was test-cultivated in Jamaica and Haiti, and substantial shipments reached the U.S. in 1949. Production was stimulated by the high price of the Indian product, which was more than 80%

above normal.

Saffron, the world's most costly spice, dropped from the usual range of from $45 to $75 per pound to $17 per pound on the Spanish market. Three stigmas of the saffron flower, hand removed from about 75,000 blossoms, constitute a pound. This spice is very popular in the cooking of certain Spanish dishes. (C. A. T.)

Sports and Games: *see* ANGLING; ARCHERY; BADMINTON; BASEBALL; BASKETBALL; BILLIARDS; BOWLING; BOXING; CANASTA; CHESS; CONTRACT BRIDGE; CRICKET; CURLING; CYCLING; FENCING; FOOTBALL; GLIDING; GOLF; GYMNASTICS; HANDBALL; HORSE RACING; ICE HOCKEY; ICE SKATING; LACROSSE; LAWN BOWLING; MOTOR-BOAT RACING; POLO; ROWING; SHOOTING; SKIING; SOCCER; SOFTBALL; SQUASH RACQUETS; SWIMMING; TABLE TENNIS; TENNIS; TRACK AND FIELD SPORTS; WRESTLING; YACHTING.

Squash Racquets.

Hunter Lott, Jr., of the Merion (Pa.) Cricket club captured the national singles squash racquets championship by defeating Donald Strachan of the Princeton club of New York, 15–12, 15–14, 12–15, 17–14. Lott combined with G. Diehl Mateer, Jr., another Merion representative, to take the doubles.

George Waring, Boston, Mass., retained the veterans' singles title, and the intercollegiate crown was retained by Mateer, who represented Haverford college, Haverford, Pa. Other major winners during 1949 included Eddie Reid, Hartford, Conn., national professional; Calvin MacCracken, Princeton club, New York State; and Ed Hahn, Detroit, Mich., Western.

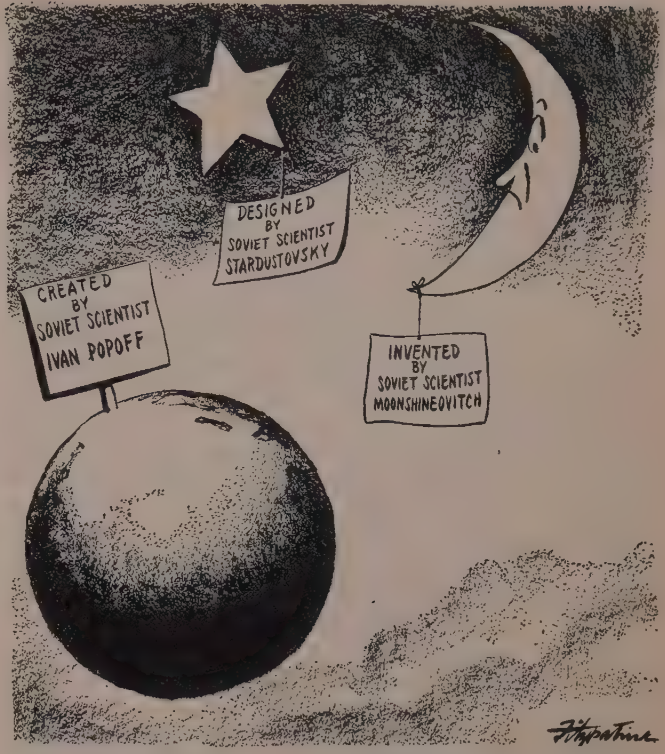
U.S. representatives won the Grant trophy, but the Lapham trophy was returned to Canada when the dominion team triumphed 7–3.

A strong British women's team visited the United States. Janet Morgan, Surrey, Eng., won the national singles championship, and teamed with Mrs. R. J. Teague, Devonshire, Eng., to take the doubles honours. Miss Morgan also won the New England States crown. The U.S. women's team regained the Wolfe-Noel cup, however, by halting the invaders, 3–2, in their first meeting since 1939.

Betty Howe, New Haven, Conn., proved one of the year's big stars, annexing the Atlantic Coast, Pennsylvania, New York State and Connecticut State Women's championships. (T. V. H.)

Stalin, Joseph Vissarionovich

(1879–), soviet prime minister, was born on Dec. 21 at Gori, Georgia, in Transcaucasia. He studied for the priesthood and entered the Tiflis Orthodox seminary in 1893, but was later expelled (see *Encyclopædia Britannica*). He became active in the revolutionary underground in Georgia and, between 1902 and 1912, was arrested and deported five times, but each time escaped. In March 1913 he was deported to the Turukhansk district in northern Siberia, where he remained until Feb. 1917. Returning to St. Petersburg (now Leningrad) he became one of the members of the Politburo of the Communist party. After the Communist *coup d'état* of Nov. 7, 1917, he was appointed people's commissar for nationalities. In 1922 he became general secretary of the central committee of the party. Soon after Nicolai Lenin's death (Jan. 21, 1924), Stalin rose to pre-eminence in the party machine, and by 1937 his position as dictator of soviet Russia was unquestionable, although he did not hold state office until May 6, 1941, when he assumed the post of prime minister. On July 19, 1941, after the German attack, he appointed himself commander in chief and minister of the armed forces, and in March 1943 he assumed the rank of marshal of the Soviet Union.



DESIGNED BY SOVIET SCIENTIST STARDUSTOVSKY
CREATED BY SOVIET SCIENTIST IVAN POPOFF
INVENTED BY SOVIET SCIENTIST MOONSHINEOVITCH

"AND ON THE SEVENTH DAY STALIN RESTED," cartoon comment by Fitzpatrick of the *St. Louis Post-Dispatch* on the growing number of inventions and discoveries being claimed for soviet scientists in 1949

During World War II Stalin met the leaders of Russia's wartime allies at Tehran (Nov. 1943), Yalta (Feb. 1945) and Potsdam (Berlin) (July 1945). On March 3, 1947, he resigned as minister of the armed forces, retaining the post of prime minister.

On Jan. 30, 1949, Marshal Stalin published his answer to four questions put to him by a U.S. news agency. He said that the soviet government was prepared to consider the publication of a joint soviet-U.S. declaration that the two governments had no intention of resorting to war against each other; that the U.S.S.R. was prepared to take measures toward gradual disarmament; that the U.S.S.R. saw no obstacles to the lifting of transport restrictions between Berlin and the western zones of Germany provided the U.S., Great Britain and France simultaneously removed transport and trade restrictions between the western and the soviet zones and pending a meeting of the Council of Foreign Ministers to consider the German problem; and that he was ready to meet Pres. Harry S. Truman to discuss these matters. On Oct. 13 he sent a message to Wilhelm Pieck, president, and Otto Grotewohl, prime minister of the German Democratic Republic, in which he expressed the opinion that the German and soviet peoples possessed "the greatest potential in Europe for accomplishing great actions of world importance." Dec. 21, his 70th birthday was celebrated throughout the U.S.S.R and the soviet-dominated states with extraordinary pomp and circumstance. (*See* also UNION OF SOVIET SOCIALIST REPUBLICS.)

Stamp Collecting: *see* PHILATELY.

Standards, National Bureau of.

Established by act of congress, March 3, 1901, this bureau is the principal agency of the federal government for basic research in physics, mathematics, chemistry and engineering. During 1949, it consisted of 21 divisions and offices: 13 scientific divisions (electricity and optics, metrology, heat and power, atomic and molecular physics, chemistry, mechanics, organic and fibrous materials, metallurgy, mineral products, building technology, applied mathematics, electronics and radio propagation); a division of commodity standards; 4 administrative divisions (budget and management, personnel, shops and plant); and 3 offices (scientific publications, international relations and weights and measures).

One portion of the bureau's work has to do with basic scientific standards and measurements. The fundamental measurements in science, industry and commerce are time, mass and length, and the year witnessed the most radical developments in these fields in history. These developments grew out of a broad program designed to establish basic measurements on fundamental, unchanging properties of matter rather than on arbitrary conventions. The measurement of length has been based on the standard metre; an ultimate standard in the green radiation of the atoms of mercury 198 was achieved more than a year before. During 1949, time was placed on an absolute atomic basis while it appeared likely that mass, too, would be linked to an atomic standard as a result of the measurement of the magnetic moment of the proton.

The atomic clock developed by the bureau is controlled by the constant frequency of the vibrations of atoms in the ammonia molecule. Invariant with age and independent of astronomical observations, the clock promised to surpass by one or two orders of magnitude the accuracy of the existing primary standard (the rotating earth).

The bureau's determination of the proton moment in absolute units was the first of its kind. Combined with other data, the determination also gave a precise absolute value of the electron-charge-to-mass ratio (e/m). The development also makes possible a convenient secondary standard for measuring the absolute value of magnetic fields. In the past, measurements involving magnetic and electric fields have been limited by the low accuracy of magnetic measurements: these can now be made with even greater accuracy than past measurements of electric fields. It is the new, precise, absolute of e/m which affords a basis for an atomic standard of mass, for the electron charge (e) can be determined with great accuracy, providing a method for calculating the mass (m) with unusual precision.

Basic investigations related to scientific constants, standards and measurements included the following: instrumentation for measurement of audio-frequency voltages with precision (1 part in 10,000), magnetic permeameter for absolute measurement of magnetizing forces up to 300 oersteds, calibration system for the speed markings of camera lenses, impedance measurements with slotted coaxial lines, field-intensity standards for VHF (very high frequency) radio waves, quartz-crystal frequency standards, electrodynamic radio-frequency ammeter (designed to serve as a primary standard), sensitive microwave instrumentation for determination of dielectric constants of substances and so on.

In electronics new and highly specialized types of circuits and devices were developed. Work continued on the design of smaller, lighter, stronger assemblies, which involved further studies of printed circuits, of the structural performance of tubes and of the properties of materials in tubes and other components.

The long-range program on electronic digital computers, undertaken in co-operation with the Office of Naval Research, bureau of census, and departments of the army and air force, showed progress in the design and initial construction phases of five machines under contract to industry while two machines under construction at the bureau were in the final stages. These two machines were to be put into operation early in 1950, one in the bureau's Washington laboratories, the other at its Institute for Numerical Analysis on the west coast.

A varied program of research on the properties of matter at extremely low temperatures was pursued. At the temperature of liquid helium, metals such as lead and tin, ordinarily poor conductors of electricity, become superconductors, completely losing their electrical resistance. As part of this program, the unusual properties of helium II near absolute zero were studied. This state of helium constitutes a fourth state of matter, in which heat is transmitted as a kind of wave motion analogous to sound and called, therefore, second sound. The experimental work yielded values for the velocity and attenuation of second sound. Other investigations included the determination of the effect of current density on the transition of a conductor from the superconducting to the normal state, the behaviour of superconductors at microwave frequencies, and the interaction between a magnetic field and the surface currents it sets up in a superconductor.

Considerable advances were achieved in the bureau's aeronautic work. For example, a vacuum-tube accelerometer for use in aircraft and biochemical research was developed. A sky compass, based on the studies of A. H. Pfund, was devised for aerial navigation in the polar regions during the long periods when neither the sun nor the stars can be used. In these regions the magnetic compass also loses its value. The sky compass is effective here because it determines the direction of the sun by analysis of the polarized light from the sun, even though the sun itself is not visible. Other projects included optical components for supersonic wind tunnels, thermal properties of wind-tunnel and jet-engine gases, telemetering equipment for studies of parachute design, landing impact vibration, airflow at the surface of an airfoil and air turbulence at supersonic speeds.

The above projects represent only a small portion of the year's work, suggesting its nature and scope. Similar work was conducted in other fields of the physical sciences. In addition to particular research projects, the bureau conducted necessary research and development in the fields of scientific standards and measurement methods, the determination of physical constants and techniques for testing materials. Standard measuring apparatus and reference standards were tested and calibrated; specifications for federal supplies were formulated; and advisory services were rendered on scientific matters to other agencies of the federal government, state and municipal governments and industry. Major programs related to the national defense constituted an important part of the work. Here ordnance electronics and guided missiles were typical, but details on these and similar programs were necessarily classified.

An increase of more than 50% occurred in the bureau's testing, calibration and standard samples activities. More than 380,000 tests and calibrations, having a fee value of about $1,400,000, were performed while more than 20,000 standard samples were prepared and sold. The range of test work included the testing of 5,500 light bulbs (a sampling of the 4,000,000 purchased by the government), testing and certification of 2,000 radium preparations and the sample-testing of 7,000,000 bbl. of cement.

The results of the bureau's work were made available through three monthly periodicals (*Journal of Research, Technical News Bulletin* and *Basic Radio Propagation Predictions*) and several series of nonperiodical publications (Applied Mathematics Series, Building Materials and Structures Series, circulars and handbooks). An indexed list of publications (Circular 460, 375 pages) was compiled and was available from the superintendent of documents, U.S. government printing office, Washington 25, D.C. (H. Od.)

Stocks and Bonds.

U.S. Stocks.—The U.S. stock market of 1949 was inactive in volume of trading, unusually steady throughout the year as to the average price level and extraordinarily unresponsive to either good or bad news. Alternate bear and bull movements—only two in number, involving a bear market during the first half of the year and a moderate recovery during the second half—were unusually small in extent. For 90 stocks combined, representing the railroad, industrial and public utility groups, the December average price level stood at 131.6, as compared with 121.9 for January, and with 120.6 and 117.7 for December and January of 1948. Briefly summarized, the 1949 price level seemed to indicate a slight bear market in certain groups of stocks, and a slight bull market in others, but without any definite momentum for future forecasting. (*See* Table I.)

Corporate dividends, with the exception of certain limited groups like the amusement, food products and mining stocks, showed an increase of 8.2% in total dividend distribution during 1949 as compared with 1948. As was the case in 1948, most groups of corporations except the rails managed to adjust themselves fairly well, through price increases and improved productive efficiency, to the large successive wage increases won by labour in 1947–49. The entire year was marked by inflation thinking and a rather marked degree of market pessimism regarding the actions of U.S. labour and the gloomy developments in Europe and Asia. The following factors were cited as affecting speculative sentiment: (1) continuing adverse developments in the international situation, particularly with respect to the U.S.S.R., Germany and China; (2) unimprovement in the inflation picture, with high prices refusing to fall and with prospects of a price increase because of recurring strikes in basic industries, as well as increased taxation prospects; (3) failure to balance the national budget by about $5,000,000,000 and the prospect of increased taxation both nationally and locally; (4) soviet possession of atomic knowledge and the prospect of continued growth in the U.S. defense burden; (5) growth in the national outlay for the welfare program and for farm support; (6) crippling strikes in two basic industries—coal and steel—toward the end of the year, and continuing agitation for additional strikes; (7) devaluation of currencies in about 30 countries; (8) continuing concentration of greater power over industry in the federal government; and (9) lack of public interest in common stocks, to such an extent that the New York Stock exchange undertook a campaign to develop greater interest.

On Nov. 1, 1949, the market value of all listed shares on the New York Stock exchange stood at $72,631,000,000, with an average flat price per share of $43.75. On Nov. 1, 1948, this market value stood at $72,186,000,000, with an average flat price per share of $45.26. A depreciation in the value per share of approximately 3.3% was thus shown for the period.

Number, Volume and Amount of Stocks.—According to the New York Stock exchange's compilation, the total stocks listed on that exchange on Nov. 1, 1949, stood at 2,145,000,000 shares, with a total market value of $72,631,000,000. This value compared with $72,185,000,000 on Nov. 1, 1948, $68,884,000,000 on Nov. 1, 1947, $66,115,000,000 on Nov. 1, 1946, and $69,560,000,000 on Nov. 1, 1945. Of the 1949 total (as of Nov. 1) United States stocks aggregated 2,079,000,000 shares, valued at $71,451,000,000, and stocks of other countries 65,834,000 shares, valued at $6,180,000,000. The total of shares was distributed over 1,432 separate United States issues and 20 issues of other countries, representing a total of 1,452 issuing corporations.

Total shares traded on the New York Stock exchange during 1949 amounted to 272,203,402 shares, as compared with 302,218,965 shares during 1948, 253,624,000 shares during 1947, 363,709,000 shares during 1946, 377,564,000 shares during 1945 and 1,125,000,000 shares during 1929, the largest yearly total

SALES AND PRICES on the New York Stock exchange, 1949

on record. The 1949 market thus appears to have been slightly less than the market of the preceding year. The New York curb market had sales during 1949 of 66,130,000 shares, as compared with 75,090,000 during 1948, 72,380,000 during 1947, 137,220,000 shares during 1946, 143,337,000 shares during 1945, 71,062,000 shares during 1944 and 71,382,000 shares during 1943. It will be observed that on the curb exchange also the volume of sales during 1949 was somewhat smaller than that of the preceding year.

U.S. Bonds.—As in 1948, the U.S. bond market was remarkably stable during 1949 at a high price level (*see* Table III). The rise in bonds after June was to the accompaniment of a similar trend in the stock market.

Table III.—*U.S. Bond Prices for 1949*

Number, Volume and Amount of Bonds.—According to the New York Stock exchange's compilation, the total par value of bonds listed on that exchange at the beginning of Nov. 1949 stood at $129,870,000,000, with a market value of $132,221,000,000—compared with $131,226,000,000 and $136,711,000,000 for the corresponding years of 1948 and 1947. Of the 1949 total, U.S. corporation bonds (at the beginning of November) amounted to $17,328,000,000 (par value), with a market value of $16,478,000,000; company bonds of other countries, a par value of $551,153,000 and a market value of $475,925,000; United States government bonds (inclusive of corporations and subdivisions), a par value of $110,279,000,000 and a market value of $114,029,000,000; and other governments (inclusive of subdivisions), a par value of $1,460,000,000 and a market value of $982,410,000. The total listed bonds of United States corporations were distributed over 616 issues with 312 issuers; of United States government bonds, 71 issues and 3 issuers; and other governments, 182 issues and 48 issuers. The total bonds traded on the New York Stock exchange during 1949 amounted to $817,949,070, as compared with $1,013,829,000 during 1948, $1,076,000,000 during 1947, $1,364,000,000 during 1946, $2,262,000,000 during 1945, $2,695,000,000 during 1944 and $3,255,000,000 during 1943.

New York Stock Exchange.—As was the case during 1948, the New York Stock exchange's alterations in its rules, practices and recommendations was confined to only a few subjects in 1949. Only five topics may be listed as significant, as follows:

Margin Requirements.—On Feb. 4 the board of governors amended its margin rules "to provide that, effective Feb. 15, purchases of securities selling at or below 5 may be made on the credit basis previously extended to securities selling above 5." On March 28 the federal reserve board ruled that beginning March 30 margin requirements for purchasing registered securities would be reduced from 75% to 50%. With respect to specialists on the exchange the federal reserve board, on July 19, also amended its margin regulations "to permit extension of credit in any amount to specialists in the securities in which they specialize." With respect to the exchange's initial margin rule, the board of governors decided upon a reduction in the minimum equity requirement from $1,000 to $500, effective June 6. On Aug. 19, the exchange rescinded its rule prohibiting solicitation of margin accounts in the homes of customers, without specific written permission of customers.

Rights of Members.—Here two actions deserve mention; namely, (1) amendment of the exchange's rules to "permit remuneration of registered representatives on a salary or a commission," and (2) refusal of the exchange to endorse permissive incorporation.

Petition for an Enlarged Board of Governors.—On Oct. 20, 422 members petitioned the exchange for constitutional amendments to increase the size of the board of governors from 25 to 32 to provide "adequate representation of active floor members." Subsequently a new petition was issued altering somewhat the first petition. The two petitions provided for the following change:

	Present	1st petition		2nd petition	
New York city members	10	14	(all active)	13	(10 to spend substantial time on floor and 7 also to be firm partners)
New York city partners	4	6	(allied members or inactive members)	6	(5 allied members and 1 member)
Out-of-town members or partners (at least 2 members)	7	8		9	
Public representatives	2	2		3	
Chairman	1	1		1	
President	1	1		1	
	—	—		—	
	25	32		33	

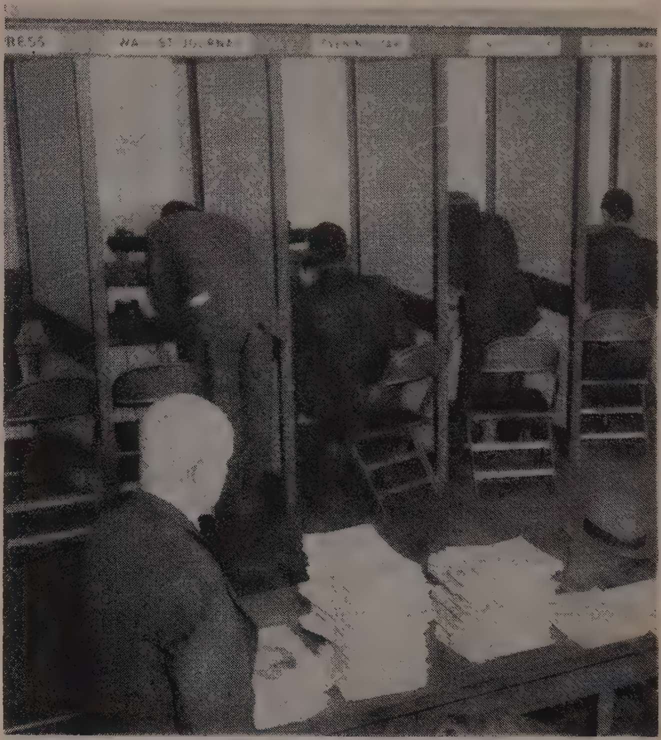
Inquiries and Recommendations.—Under this heading five subjects may be mentioned as most important; namely:

1. A committee inquiry into the advisability and practicability of the retirement of members.
2. A study by a committee of the question of trading hours.
3. A proposed consolidation of midwestern exchanges. Concerning this proposal Emil Schram, president of the New York Stock exchange, made the following statement: "The announced purpose of the proposed consolidation of several mid-western regional stock exchanges is, as I understand it, to provide better markets for the securities of local companies. This is commendable. I feel that I should make it clear, however, that if there is any departure from the stated objectives, in the direction of a dilution of the national market provided by the New York Stock Exchange, such a step would be seriously detrimental to the public interest."
4. A survey by a special committee of the public relations program of the exchange.
5. A tax study submitted by President Schram, to President Truman and to congress, concerning the federal tax structure in relation to the capital market and employment. The proposal recommended "that individuals be allowed a credit of 10% on common stock dividends in computing their income tax as a start toward elimination of double taxation; a reduction of the tax on long-term capital gains to 10%; an increase to $5,000 of the amount of capital loss that can be offset against ordinary income annually, and a shortening of the holding period to 3 months."

Financial Statement of the Exchange.—According to the condensed statement income and expenses of the exchange for the nine months ended Sept. 30, 1949, showed a net loss of $325,995. This compared with a loss of $367,108 for the same period of 1948. (S. S. H.)

Great Britain.—Nowhere could the shadow, and the final substance, of devaluation of the pound, which took place on Sept. 18, 1949, be seen more clearly than in the gold mining share section of the stock exchange. Since the official U.S. price of gold remained at $35 an ounce, the effect of lowering the value of the pound from $4.03 to $2.80 was to raise the price of gold in terms of sterling; the actual increase arising out of this devaluation was from a price of £8 12*s.* 3*d.* to £12 8*s.* a fine ounce. Sterling producers of gold, such as South African, west African and Australian mines therefore stood to gain enormous advantages from devaluation, provided that the higher cost of machinery and stores imported from dollar areas and increased labour costs did not offset the addition to the revenue of the mines. At the end of 1948 the *Financial Times* gold mines index had fallen to 94.67, its lowest since July 1932. This downward trend was not reversed until March 1949. After that month the index advanced more or less without a break until following the Sept. 18 devaluation it achieved a new and substantially higher level, closing 1949 approximately 40% higher than in Jan. 1949. (*See* Table V.)

On the other hand, devaluation and the factors leading up to it had a depressing effect on the other principal classes of securities quoted on the stock exchange. British government securities touched the lowest levels since 1939. The fall amounted to 7%; until the government broker dramatically reversed the downward trend on Nov. 11, it was more than 10%. Such percentages represented immense falls in total money values, probably to the extent of £1,000,000,000 in British government securities alone. As the year closed, the effects of devaluation were tending to improve the external balance of trade and the gold and foreign exchange reserves of the country. This was reflected in firmer markets for British government securities.



RELEASE ROOM of the crop reporting board of the U.S. department of agriculture in Washington, D.C., where new crop reports are released impartially at a prearranged day, hour and minute. At the word "go," press reporters (above) dash to open phone lines and dictate high lights of the new crop reports to their papers

The steady rise throughout the year in yields of British government securities would, in normal circumstances, have tended to raise yields and depress prices of industrial shares quite irrespective of other influences. The yield on 2½% consols advanced from 3.13% to about 3.5%, but the parallel movement in the yield of industrial ordinary shares was of greater proportions, from 4.38% to 5.20%. However, the bear market, which began in industrial ordinary share prices at the beginning of 1947, persisted in 1949 and was in fact accelerated. While the falls in 1947 and 1948 were only of the order of 5% or so, in 1949 prices fell by 12¼%.

There was, indeed, little encouragement for investors to take an optimistic view of the future of share prices. The continued austerity policy of the government and the more or less fixed nature of dividends, the result of dividend limitation, provided no incentive. Taxation was increased by the raising of the distributed profits tax from 25% to 30% following devaluation. As the year ended, a brighter atmosphere developed, which is

These indices of prices on the London stock exchange are reproduced by courtesy of the *Financial Times*, London.

Constituents of the indexes are: industrial ordinary, 30 of the leading British industrial equities; government securities, 11 British government securities, including short-dated, medium-dated, long-dated and some redeemable only at the option of the government; gold mines, 30 South and West African and West Australian gold mining shares. The industrial ordinary share yield is based on dividends on the shares in the industrial ordinary share index. Stock exchange markings are the number of bargains recorded in the stock exchange official list. Base dates of the indexes, when they were 100, are: industrial ordinary, July 1, 1935; government securities and gold mines, Oct. 15, 1926.

not unusual at that season. This was partly a reflection of the reluctance of investors to sell and the consequent market shortage of stock. (A. L. W. S.)

Strikes. Detailed statistics on causes, results and numbers of current strikes and lockouts are published by the U.S. department of labour and the ministries of labour of Great Britain and Canada.

During 1948 (Table I), the U.S. experienced 3,419 labour disputes, a decline of 274 from the 1947 level and of 1,566 from the 1946 level. A total of 34,100,000 man-days were lost in 1948 which was only slightly less than in 1947. This was opposed to the record level of 116,000,000 man-days lost in 1946. The first eight months of 1949 indicated a further decline in such activity since the strikes in progress caused a loss of less than 19,000,000 working days. However, several very large strikes of several weeks' duration occurred in the coal mining and steel industries in later months.

All known work stoppages, arising out of labour-management disputes, involving six or more workers and continuing as long as a full day or shift are included in reports of the bureau of labour statistics. Figures on man-days idle and workers involved cover all workers made idle in establishments directly involved in a stoppage. Figures for 1949 are preliminary and subject to revision.

A comparison of the numbers and results in time lost of work stoppages in Great Britain for the first eight months of 1949 and the corresponding months of 1948 is given in Table II. Although the number of workers involved in 1949 increased slightly, the number of strikes and the number of man-days lost decreased. In two of the major industries, coal mining and transportation, the number of strikes declined while man-days lost increased. In iron and steel manufacture and in the important textile industries, however, the number of man-days lost were reduced.

During the first eight months of 1949, the number of strikes beginning decreased over the corresponding months of 1948, declining from 1,280 in 1948 to 989 in 1949. There was a slight increase in the number of workers involved in 1949 when 359,400 persons were directly affected by labour disputes as opposed to 357,200 in 1948.

Working days lost decreased from 1,729,000 in 1948 to 1,463,000 in 1949.

Table III indicates the relative frequency and size of labour disputes in Great Britain in the first eight months of 1949 as compared with the same period in 1948. The large increase in number of working days lost in May 1949 over the same period in 1948 can be accounted for largely by the strike of the colliery workers in Lancashire. A similar fact resulted from the July 1949 strike of the London dock workers.

Table I.—*United States: Number of Strikes Beginning in the Year, Workers Involved and Man-days Lost*

Year	Number of strikes	Number workers involved	Man-days idle during year	Per cent of estimated work time
1935–39 (average)	2,862	1,130,000	16,900,000	0.27
1945	4,750	3,470,000	38,000,000	.47
1946	4,985	4,600,000	116,000,000	1.43
1947	3,693	2,170,000	34,600,000	.41
1948	3,419	1,960,000	34,100,000	.37
1949 (8 mo.)	2,625	1,910,000	18,750,000	.32

Source: United States Bureau of Labor Statistics, *Monthly Labor Review.* 1949 figures are preliminary.

Table II.—*Analysis by Industries of Work Stoppages Arising from Industrial Disputes in Great Britain: First Eight Months of 1949 and Corresponding Months in 1948*

Industry	Jan.-Aug. 1949 Number of stoppages beginning in period	Jan.-Aug. 1949 Number of workers involved in all stoppages in progress	Jan.-Aug. 1949 Aggregate number of working days lost in all stoppages in progress	Jan.-Aug. 1948 Number of stoppages beginning in period	Jan.-Aug. 1948 Number of workers involved in all stoppages in progress	Jan.-Aug. 1948 Aggregate number of working days lost in all stoppages in progress
Coal mining	614	212,800*	660,000	815	154,700*	381,000
Brick, pottery, glass, chemicals, etc.	10	900	3,000	19	2,000	9,000
Engineering	69	10,700	70,000	69	46,900	120,000
Shipbuilding	33	7,000	43,000	49	16,000	207,000
Iron, steel and other metals	71	14,400	49,000	74	34,100	515,000
Textile	24	7,100	43,000	34	13,700	52,000
Clothing	12	900	5,000	21	6,300	25,000
Food, drink, tobacco	9	400	2,000	20	3,600	16,000
Woodworking, furniture, etc.	8	600	11,000	15	700	5,000
Paper, printing, etc.	5	800	5,000	8	3,500	25,000
Building, etc.	35	8,300	20,000	20	2,100	8,000
Transport	58	90,000*	523,000	79	62,800*	320,000
Distribution, commerce, etc.	7	800	1,000	9	3,200	11,000
Other industries and services	34	4,700	28,000	48	7,600	35,000
Total	989	359,400*	1,463,000	1,280	357,200*	1,729,000

*Some workers, largely in the coal mining and transport industries, were involved in more than one stoppage and are counted more than once in the totals. For all industries combined the net total workers involved was approximately 300,000 in the 1949 period and 310,000 in the 1948 period.

Source: *Ministry of Labour Gazette* (London).

Wage questions caused 42.7% of strikes in Great Britain in the first eight months of 1949 and accounted for 54% of the workers directly involved. Following wage questions in importance as strike causes were the problems caused by working arrangements and the employment of particular classes or persons. Although sympathetic action accounted for only 1.6% of the stoppages in this period, 10.1% of the workers involved in industrial disputes were accounted for by this cause. (*See* Table IV.)

Table III.—*Relative Frequency and Size of Labour Disputes in Great Britain: First Eight Months of 1949 and Corresponding Months in 1948*

Month	Strikes in progress 1949	Strikes in progress 1948	Number of working people involved* 1949	Number of working people involved* 1948	Number of working days lost 1949	Number of working days lost 1948
January	117	183	54,000	32,700	115,000	83,000
February	127	194	19,000	70,900	54,000	288,000
March	172	213	19,000	62,000	71,000	227,000
April	133	206	40,000	86,000	136,000	628,000
May	159	190	76,000	31,800	350,000	86,000
June	158	152	47,000	59,100	190,000	269,000
July	72	94	24,000	11,600	265,000	25,000
August	108	147	104,000	34,400	273,000	123,000

*The number of workers involved includes those who were thrown out of work at the establishments where the stoppages occurred, though not themselves parties to the dispute.

Source: *Ministry of Labour Gazette* (London).

Table V compares the number and time loss in Canadian labour disputes for the first eight months of 1949 with figures for all of 1948. During Jan., Feb. and Aug. 1949, time lost and employees involved declined below the corresponding months of 1948. All other months of 1949 experienced an increase in time loss (except July) and in number of workers involved. (*See* also Business Review; Labour Unions; National La-

Table IV.—*Analysis of Principal Causes of Industrial Disputes in Great Britain: First Eight Months of 1949*

Principal causes	Stoppages begun during 1949 Number	Stoppages begun during 1949 Per cent	Workers directly involved Number	Workers directly involved Per cent
Wage increase	57	6.0	37,900	16.4
Other wage disputes	351	36.7	86,800	37.6
All wage disputes	408	42.7	124,700	54.0
Hours of labour	36	3.8	6,300	2.7
Employment of particular classes or persons	148	15.6	42,600	18.4
Other working arrangements	319	33.3	27,400	11.4
Trade union principle	29	3.0	6,500	2.4
Sympathetic action	16	1.6	23,300	10.1
Total	956		230,800

Sugar. The period of sugar shortages which began in 1942 ended in 1949. Production of sugar in 1948–49 in the principal areas supplying the U.S. was 10,695,000 tons, only 6% less than the record crop of 1947–48, and far above prewar. Production in 1949–50 in areas supplying the U.S. was preliminarily estimated to be approximately 10,100,000 tons, or 5.5% less than in the previous year, the reduction being largely the result of an expected decline in the Cuban harvest.

Total sugar production in the U.S. proper was estimated for 1949 at about 2,100,000 tons, compared with 1,846,000 tons in 1948. The preliminary estimate of the 1949 crop included 1,550,000 tons of refined beet sugar and 550,000 tons of cane sugar. The 1949 U.S. crop included a sugar-beet crop of 10,110,000 tons, 9% larger than the 9,422,000 ton crop of 1948 and about the same as for the 1938–47 average. Acreage harvested dropped to 690,000, compared with 694,000 in 1948 and 796,000 average of 1938–47. Yields under generally favourable weather increased to 14.7 tons per acre, compared with 13.6 tons in 1948 and 12.7 tons average 1938–47.

Table I.—*U.S. Sugar-Beet Production*
(In thousands of short tons)

State	1949	1948	Average, 1938–47
California	2,565	2,819	2,068
Colorado	1,872	1,370	1,912
Idaho	1,062	1,233	1,026
Michigan	739	458	788
Montana	690	672	867
Nebraska	559	496	801
Utah	462	427	577
Wyoming	392	310	467
Ohio	247	161	290
Other States	1,580	1,476	1,349

The 1949 sugar-cane crop, mostly in Louisiana, to be used for sugar making, was well above average and was estimated at 6,842,000 tons, compared with 6,279,000 tons in 1948 and an average for the previous decade of 5,503,000 tons. Yields in tons per acre were high at 21.5, compared with an average for the decade of 20.3. Acreage at 318,600 was slightly above 1948.

Sugar cane for syrup in several southern states was a smaller crop in 1949, principally because acreage was cut to 69,000 from 79,000 the previous year. Production was 11,770,000 gal., against 13,390,000 gal. in 1948.

Other minor U.S. sources of sugar, such as honey and maple sugar products, were produced in 1949 in significantly larger amounts than in 1948, whereas sorgo syrup was the smallest crop on record, 6,012,000 gal., against 7,665,000 gal. in 1948 and 11,173,000 gal. for the decade. Maple products of the northeast amounted to 1,614,000 gal. of syrup and 292,000 lb. of sugar, against 1,445,000 gal. of syrup and 229,000 lb. of sugar in 1948. The 1949 honey crop was estimated at 229,751,000 lb., 11% more than in 1948. Prices were generally lower. Honey was included under mandatory price supports in the Agriculture act of 1949, primarily because of the value of the honey bee in the pollination of many agriculture crops.

Table II.—*U.S. Sugar-Cane Production*
(In thousands of short tons)

State	1949	1948	Average, 1938–47
Louisiana	5,781	5,261	4,643
Florida	1,061	1,010	860

PHILIP MURRAY, president of the C.I.O., addressing some 10,000 steel workers in Gary, Ind., on the pension and welfare issues involved in the nation-wide United Steelworkers' strike which began on Oct. 1, 1949

Civilian consumption of refined sugar in 1949 was estimated at 93.3 lb. per person, compared with 95.6 lb. in 1948 and an average of 97 lb. during the years 1935–39.

The U.S. sugar supply quota for 1949 was initially set at 7,250,000 tons by the U.S. department of agriculture, but later was raised to 7,500,000 tons. Under the Sugar act of 1948, the department of agriculture late in 1949 again held public hearings in order to determine the 1950 requirements of consumers in the continental U.S., and the marketing quota for 1950 was set at 7,500,000 tons.

Domestic sugar prices were fairly stable during 1949 at levels slightly above those of 1948; the wholesale price of refined sugar ranging about 7.5 cents to 8 cents per pound, whereas U.S. prices on raw sugar were less than 6 cents per pound, and world prices approximated 4 cents per pound.

The world cane- and beet-sugar crop of 1949–50 was estimated at 36,646,000 short tons (raw value), 2% less than the record crop of 37,249,000 tons of the previous year. Of that total, beet sugar accounted for 11,362,000 tons, compared with 11,071,000 tons in 1948–49, a prewar average of 12,025,000 tons and a 1945–46 low of 6,626,000 tons. Sugar from cane was only 25,284,000 tons, nearly 900,000 tons less than the record crop of 1948–49. Smaller Cuban production was expected, as well as decreases in Brazil and some of western Europe. The Cuban crop declined to about 5,300,000 tons, compared with 5,763,000 tons in the previous year and 3,183,000 tons prewar, 1935–39. Java and Formosa were still far below prewar levels of production. Several European countries, the U.S.S.R. (2,200,000 tons) and the Philippine Islands harvested larger crops. Somewhat less than one-third of the total crop was expected to move in world trade. (*See* also FOOD SUPPLY OF THE WORLD.)

(J. K. R.)

Suicide Statistics.

The upward trend of the suicide death rate in the United States from the low point of 10 per 100,000 population in 1944 continued into 1949. Provisional indications from the experience of the millions of industrial policyholders of the Metropolitan Life Insurance company pointed to a 6% rise from 1948 to 1949. The estimated total number of deaths from suicide in the United States in 1948 was 16,878, with a death rate of 11.6 per 100,000 population. This total was distributed as follows according to race and sex: white males, 12,277; white females, 4,010; nonwhite males, 516; nonwhite females, 75. The respective death rates from suicide, per 100,000, were: 18.9, 6.1, 6.9 and 1. The suicide death rate for the white population as a whole was more than three times that for the nonwhite. Considered with respect to age, the death rates per 100,000 population at the stated ages were, in 1948: ages 1 to 14, 0.1; ages 15 to 24, 4.6; ages 25 to 44, 12.1; ages 45 to 64, 24.3; and ages 65 and over, 29.5.

The postwar rise in suicide mortality was in conformity with other postwar experiences and was anticipated. However, despite five years of rise, the provisionally indicated rate for 1949 was still below the immediate prewar level. In the prewar situation (1939–1941) in the United States, at age 20 the chances of eventual death by suicide were 18 per 1,000 for white males, 5 per 1,000 for white females, 4 per 1,000 for nonwhite males and only 1 per 1,000 for nonwhite females.

Canada in 1948 recorded 998 deaths from suicide, with a rate of 7.8 per 100,000 population, compared with a rate of 7.4 for 1947. In England and Wales, the number of suicide deaths recorded for 1948 was 4,788 and the death rate as 11 per 100,000; the rate for 1947 was 10.5 per 100,000 population.

Sulphur.

World production of sulphur increased from about 4,700,000 short tons in 1946 to 5,380,000 tons in 1947 and 5,940,000 tons in 1948. The United States supplies about 90% of the total, with Italy, Japan and Argentina the only countries with outputs in excess of more than 1% of the total.

United States.—The salient data of the sulphur industry in the United States are shown in the following table, as reported by the U.S. bureau of mines.

Data on Sulphur Industry in the United States

(In thousands of short tons)

	1943	1944	1945	1946	1947	1948
Production.	2,843.5	3,604.4	4,203.6	4,322.8	4,974.1	5,453.5
Shipments.	3,308.3	3,941.4	4,293.3	4,623.6	5,020.7	5,576.4
Imports.	18.7	...	...	...	...	...
Exports.	764.4	756.2	1,055.8	1,395.3	1,511.5	1,451.0
Available supply . .	2,562.6	3,185.2	3,237.5	3,228.3	3,509.2	4,125.4
Consumption.	2,836	3,270	3,316	3,256	3,965	3,612.0
Stocks (producers') . .	4,997	4,600	4,484	4,221	3,771.5	3,612.0

The production rate was allowed to decline slightly in 1949, the total for the year being 5,314,416 short tons. Shipments continued to have a small lead over production, with 5,364,028 tons, and stocks dropped to 3,471,222 tons. (G. A. Ro.)

Supreme Court of the United States.

The court suffered the loss of two of its members, during summer vacation, by the deaths of Associate Justice Frank Murphy on July 19 and Associate Justice Wiley B. Rutledge on Sept. 10. They had served since 1940 and 1943, respectively.

Pres. Harry S. Truman named Thomas C. Clark (*q.v.*), of Texas, the then attorney general of the United States, to succeed Justice Murphy and named Sherman Minton (*q.v.*), of Indiana, a judge of the United States court of appeals for the 7th circuit and formerly a United States senator, to succeed Justice Rutledge.

The October term, 1948, the longest in the history of the court, began Oct. 4, 1948, and continued through June 27, 1949.

In number of cases disposed of, the 1948 term ranked second only to the 1946 term—1,434 cases as against 1,520. In the opinion of the court, 90% of the cases did not merit disposition by full opinion as indicated by the fact that only 147 cases were covered by the 114 signed opinions rendered. There were 110 such opinions at the previous term. Ninety dissenting opinions were written and 35 decisions were by a vote of 5 to 4 as compared with 70 and 24 at the 1947 term. In addition there were 36 concurring and separate opinions. As at the preceding term the government was a party to slightly more than 50% of the cases decided by written opinion, approximately 70% being in its favour. Criminal matters, federal and state, again predominated.

Members of the Court.—The United States supreme court was composed at the end of 1949 of the following members (dates indicate year appointment was confirmed by the senate): chief justice, Frederick M. Vinson (1946); associate justices, Hugo L. Black (1937), Stanley F. Reed (1938), Felix Frankfurter (1939), William O. Douglas (1939), Robert H. Jackson (1941), Harold H. Burton (1945), Thomas C. Clark (1949) and Sherman Minton (1949). (*See* also LAW.)

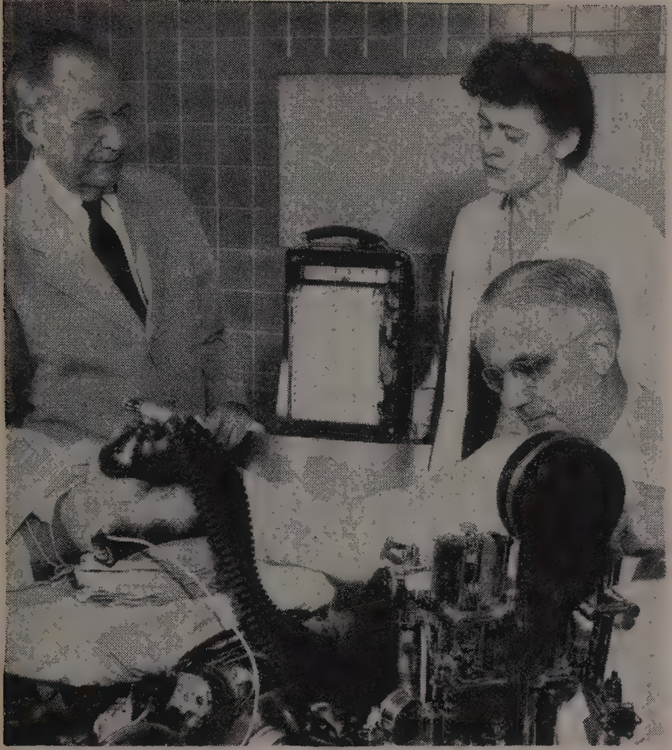
(H. B. WY.)

Surgery.

In 1949 increasing attention was paid to clotting in the veins of persons, most of whom were hospital patients and in bed. Surgeons, more than internists, have emphasized the fact that venous thrombosis occurs frequently in patients suffering from nonsurgical conditions and is particularly likely to occur in patients with heart disease. In spite of measures used to decrease the incidence of venous clotting, the condition was apparently increasing. Alton Ochsner, M. E. DeBakey and Paul DeCamp showed that in the Huey P. Long Charity hospital in New Orleans, La., an institution in which considerable emphasis has been placed on venous thrombosis and in which prophylactic measures have been used, the incidence increased in recent years. Not only has the incidence of venous thrombosis and pulmonary embolism increased, but they have become relatively more important in patients who are subjected to operation. With the control of shock by the adequate administration of blood and the prevention and control of infection by the administration of antibiotics preoperatively and postoperatively, these two previously important postoperative causes of death have been practically eliminated, leaving venous thrombosis as the principal cause of death after operation. In order to determine which patients are potential sufferers from thrombosis, John Kay and Ochsner showed that clotting within the veins is dependent on a disproportion between the precursor of the clot, prothrombin, and its antagonist, antithrombin. By the determination of the antithrombin content of the blood, they



ROY D. McCLURE (left), Vivian G. Behrmann and Frank W. Hartman of the Henry Ford hospital, Detroit, Mich., applying the oxyhaemograph (above), a recording instrument for determining blood oxygen during anaesthesia, cardiorespiratory disorders, etc. A photoelectric-ear-cell registered greater light transmission through bright red oxygenated blood, and lower transmission through darker blood of decreased oxygen saturation, etc.

were able to predict the development of a clot. A deficiency of antithrombin can be prevented by the administration of alpha-tocopherol and calcium, which exert antithrombin activity.

The development of new techniques for the surgical correction of heart anomalies is of major interest. Rheumatic fever may produce severe permanent damage to the valves of the heart. Dwight E. Harken showed that the obstruction to the flow of blood by a badly scarred valve of the heart (mitral stenosis) can be relieved by cutting the narrowed heart valve. An instrument is inserted into the heart chamber and the valve. A piece of the scarred valve is removed. Charles P. Bailey and Richard P. Glover, working on the same problem, showed that both in the experimental animal and in human beings the condition could be relieved by introducing a knife under the direction of a finger, which is put into the heart chamber, and by cutting the valve to relieve the obstruction. Both these authorities reported successful results in patients. Because a patient with this disease (mitral stenosis) suffers from damming back of the blood into the lungs resulting from increase in pressure of the veins within the lungs, Bland and Sweet corrected the abnormality by shunting the blood from the lung veins into the systemic veins of the body. They operated on a number of patients successfully by joining a branch of the lung vein to one of the chest wall veins. Patients who previously suffered severe haemorrhages from their lungs were greatly benefited.

Another approach to the problem of patients with bad heart disease resulting in heart failure was made by Pedro Cossio and Isidro Perianes. They obtained relief of symptoms in patients with severe heart damage and evidences of heart failure by tying off the main vein (vena cava) draining the lower part of the body. In this way, by decreasing the blood flow back to the heart, the marked pressure in the veins and the heart is decreased. This method has been applicable only in the severe cases and when other methods are not suitable.

In order to relieve the symptoms from diminished blood supply to the brain in patients with scarring of the brain from various causes, G. H. Sciaroni suggested uniting the main artery supplying the head with the vein draining the brain (carotid-jugular anastomosis). Sciaroni performed this operation successfully in patients with paralysis and with epileptic seizures resulting from brain scarring. C. S. Beck and his associates performed the operation successfully in children with a decrease in the brain substance due to a diminished blood supply. By the procedure of anastomosis of the artery with the vein, arterial (oxygenated) blood coursing through the main artery (the carotid) is carried through the veins of the brain in these patients. In this way the brain is better nourished than it would be otherwise. (*See* also Anaesthesiology; Medicine.)

(A. O.)

Surinam (Dutch Guiana). A Netherlands colony in northeastern South America, Surinam is bounded on the north, east, south and west by the Atlantic ocean, French Guiana, Brazil and British Guiana, respectively. Area: 54,291 sq.mi.; population (1948 est.): 209,700. In addition to 80,600 native-born Surinamese and American Indians, principal population groups include 56,000 British Indians, 35,000 Javanese, 19,000 Negroes, 2,400 Chinese, 750 Dutch-born and 450 born elsewhere in Europe. The capital and chief port is Paramaribo (pop., 1946 est., 71,000); other towns (with 1946 pop. est.) are Nieuw Nickerie (3,100) and Moengo (1,600). The official language of the colony is Dutch, although English, Javanese, Hindi, and Urdu are also widely understood, and a Surinamese dialect called "Negro English" or "talkie-talkie" is in widespread use. Governor in 1949: Willem Huender; after Dec. 2: J. Klaessesz.

History.—Projects designed to secure autonomy for Surinam within the Netherlands empire moved forward during 1949 with less friction than in the previous year. However, some agitation followed the adjournment at Havana, Cuba, on July 21 of a meeting of representatives of the Latin-American republics sponsored by the American Committee on Dependent Territories, which had been established in 1948 by the Ninth International Conference of American States. The Havana meeting adopted a resolution requesting a later inter-American conference to call upon the remaining European powers with American possessions to co-operate in (1) granting eventual independence to these holdings, and (2) establishing United Nations trusteeship arrangements for colonies found to be incapable of self-government. Meanwhile, the Netherlands government intensified its co-operation with the U.S., the United Kingdom and France through the International Caribbean commission, representing a four-power approach to the problems of Surinam and other dependent territories in the western hemisphere.

During 1949 plans were begun for the 1950 conference of the commission, the agenda including industrial development, labour conditions, human rights and agricultural problems in the affected colonies. (*See* also Netherlands Antilles.)

(G. I. B.)

Education.—On Jan. 1, 1949, Surinam had 129 primary schools with 773 teachers and 31,463 pupils. About 12.5% of the 1949 budget was earmarked for education.

Finance.—The monetary unit is the Surinam guilder, valued on Dec. 15, 1949, at $0.530264, U.S. currency, official rate. Actual government revenue in the fiscal year 1948 was 22,147,000 guilders (estimated 1949: 26,683,000 guilders); actual expenditure was 21,120,000 guilders (estimated 1949: 26,090,000 guilders). There is no national debt. Notes in circulation on Oct. 1, 1949, totalled 10,683,000 guilders; the gold reserve was 6,586,649 guilders. The Surinam bank, the local bank of issue, had deposits of 8,474,091 guilders on Oct. 1, 1949; the other commercial bank had deposits of 732,088 guilders. On Dec. 31, 1948, the Government Postal Savings bank had deposits of 4,440,887 guilders.

Trade and Communications.—Exports in 1948 totalled 27,371,980 guilders; imports were 36,172,232 guilders. The chief exports were bauxite (79%), timber (5%), citrus fruit (5%), gold (4%), balata, rice and coffee. Principal customers were the U.S. (85%) and the Netherlands (10%); the chief suppliers were the U.S. (49%), the Netherlands (30%) and Trinidad (6%).

Internal transportation is largely by water. International air service was supplied by five air lines in 1949. In 1948 there were 1,505 telephones and 500 mi. of wire.

Production.—The major economic activity is the extraction of bauxite, most of which is exported to the U.S. Production figures in 1948 included bauxite 2,186,000 short tons, gold 4,150 troy oz. and balata 410 short tons.

Sweden.

A democratic monarchy of northern Europe. Area: 173,390 sq.mi.; pop. (Dec. 31, 1948): 6,924,888. Capital: Stockholm (pop. Dec. 31, 1949) 732,281. Other principal cities (pop. Dec. 31, 1949) were Göteborg 349,323, Malmö 189,391, Norrköping 84,228, Hälsingborg 71,263, Örebro 65,630, Upsala 61,561. Religion: Lutheran Christian. Ruler in 1949: King Gustavus V. Prime minister: Tage Erlander.

History.—Sweden tried in 1949 to achieve something of the old dream of Scandinavian union. The immediate occasion was Sweden's desire to remain aloof from the conflict of east and west, and its fear that Denmark and Norway might be led into the arms of the Atlantic bloc. If Norway, for instance, should become occupied or be used as a base by either of the great power antagonists during a war, it would be practically impossible for Sweden to hold apart. Sweden therefore offered to include Denmark and Norway in its own armed neutrality sphere, to regard Scandinavia as one defense area, the only condition being that its neighbours make no commitments to the western powers. A series of conferences in Karlstad, Copenhagen and Oslo in January tried strenuously to attain agreement. In Copenhagen not only the foreign ministers, but representatives of each of the political parties (except Communist) from each of the three countries, met in what was almost a Scandinavian parliament. But Sweden insisted that Scandinavia stand alone, and Norway insisted that it must have arms and guarantees from the west. Union of the north failed once more.

Denmark and Norway joined the North Atlantic treaty, and Sweden stood alone. The chief avowed reason for Sweden's unwillingness to join the Atlantic group of states was that Sweden feared its accession would antagonize the Soviet Union and perhaps lead to increased soviet pressure on Finland—and thus on Sweden's own borders. Ideologically Sweden was with the west, and in case of the outbreak of a fighting war most Swedes felt it likely they would be drawn in. Attempts continued to achieve some form of military co-ordination between Denmark, Norway and Sweden, but nothing significant was accomplished.

Co-operation in the economic realm seemed as difficult as it was in the strategic or diplomatic. A joint committee began in 1948 discussion of a northern customs union, and the insistence of the U.S. on "integration" in connection with the European Recovery program brought a pledge of action from the three Scandinavian ministers. But by the end of 1949 the three countries had still been unable to find the bases for common action.

MASS PRECISION exhibited by the Danish men's team at the World Gymnastic festival held in Stockholm, Sweden, during July 1949. The Danes are shown doing *Brysthaevninger* (push-ups)

Sweden participated in the discussions of the Council of Europe. In December a one-year trade agreement with Britain supposedly prepared the way to the future abandonment of such bilateral agreements. British and Scandinavian officials held preliminary discussions in Stockholm on the mutual removal of currency restrictions and the freeing of trade. One practical step in widened co-operation was the integration of schedules between the Scandinavian Airlines and the Dutch and Belgian lines.

The Marshall plan or ERP was aiding Sweden, but indirectly rather than directly. Sweden, more prosperous than most of the countries involved, received no outright gifts. In the first year its allotment was about half loan and half "conditional aid"—that is, payment in dollars for goods or credits granted by Sweden to others in the group. In the second year the only aid was this dollar payment for goods—$48,000,000 recommended. (*See* also European Recovery Program.)

Sweden's new problems of foreign exchange were being met by heroic slashes in imports from the U.S., and by attempts to increase exports to the U.S. of glass, furniture and pulp.

Price difficulties blocked its hopes in the first part of the year, but the government felt it dared not devalue the krona alone. In September, when Britain devalued, Sweden immediately followed suit, and to the same extent of 30.5%.

During the year rationing was relaxed or abandoned on most foods; gasoline and coffee, both imported, were the chief items still restricted.

Sweden still faced a serious problem of immigration. In November there were 195,000 foreigners in the country, of whom 92,000 were employed. Ten thousand refugees had entered since the end of the war. From across the Baltic 1,700 Poles and east Germans had entered illegally in a 12-month period. Some fled from persecution; many merely sought better economic conditions. About 60 small boats were known to be engaged in more or less regular refugee traffic. About 10% of the immigrants had been refused admission. (F. D. S.)

Education.—Schools: elementary (1947–48) pupils 555,000, teachers 27,500; higher elementary (1948–49) pupils 4,359; continuation (1947–48) pupils 71,600; (municipal) middle (1948–49), pupils: mixed 4,470, girls' 16,254, practical 7,103; state secondary (1948–49) 203, pupils 75,032; higher private (1948–49) pupils 8,472; folk high schools (1948) 70, students 7,887; two universities and three institutions of higher education (1948–49): students 9,742.

Finance and Banking.—Budget: (1949–50 est.) revenue 5,139,000,000 kronor, expenditure 4,677,000,000 kronor. Public debt: (Aug. 1949) 12,046,000,000 kronor; (Aug. 1948) 11,610,000,000 kronor. Currency circulation: (Oct. 1949) 2,894,000,000 kronor; (Dec. 1948) 3,113,000,000 kronor. Gold reserves: (Oct. 1949) 364,000,000 kronor; (Nov. 1948) 289,000,000 kronor. Commercial bank deposits: (Aug. 1949) 8,100,000,000 kronor; (Aug. 1948) 7,443,000,000 kronor. Savings bank deposits: (June 1949) 6,967,000,000 kronor; (March 1948) 6,488,000,000 kronor. The cost-of-living index (1935=100): March 1949, 169 (March 1948, 164). The monetary unit is the krona (pl. kronor); exchange rates: (Sept. 15, 1949) U.S. $1=3.60 kronor (Dec. 15, 1949) U.S $1=5.18 kronor.

Foreign Trade.—(1948): Imports 4,887,000,000 kronor, exports 3,964,000,000 kronor. The largest supply countries (1948): Great Britain (839,000,000 kronor); U.S. (688,000,000 kronor); Belgium (290,000,000 kronor); Poland (265,000,000 kronor); France (256,000,000 kronor). The best customer countries were: Great Britain (673,000,000 kronor); Norway (366,000,000 kronor); U.S. (295,000,000 kronor); Netherlands (244,000,000 kronor); Belgium (240,000,000 kronor). Sweden's principal imports (1948): textiles (826,000,000 kronor); oil and mineral products (1,003,000,000 kronor); metals and metal products (652,000,000 kronor); machines, apparatus and electrical material (519,000,000 kronor). Principal exports: pulp, paper, etc. (1,571,000,000 kronor), the volume of pulp exports being maintained in 1949 despite loss of sales to U.S.; metals and metal products (455,000,000 kronor); machines, apparatus and electrical material (458,000,000 kronor); wood and woodwork (451,000,000 kronor).

Transport and Communications.—Railways (1948): 16,869 km. Roads (1949): 90,004 km., including 4,748 km. paved. Motor vehicles in use (Dec. 1948): private cars 179,587; trucks 76,368; buses 6,471. Shipping (Dec. 1948): 2,204 seagoing vessels (1,457 steam and motor) amounting to 2,057,304 gross tons. In 1948 Swedish shipbuilding, with 246,000 tons constructed, ranked second in the world. Telephones (Dec. 1948): 1,450,478 or 212 per 1,000 inhabitants. Radio licences (1949): 2,025,099, or one for every Swedish family.

Agriculture and Fisheries.—Harvest estimates for 1949: cereals 908,400 metric tons (1948, 1,024,300 tons); grain for fodder 20% below and potatoes 11% below the 1930–39 average. In 1949–50 Sweden would have to import 75,000 tons of refined sugar. Oleiferous plants, subsidized by the state, by 1949 ensured the nation's supply of edible fats. In 1947, 7,517,707 ha. of state forests produced 5,671,813 cu.m. of timber. Livestock (June 1, 1948): horses 497,260; cattle 2,624,708 (1,705,479 cows); pigs 1,195,018; sheep 349,446; goats 17,177; poultry 9,007,321; reindeer (1946) 168,640. Fisheries (1947): total catch 155,942 metric tons worth 89,000,000 kronor.

Industry.—Industrial establishments (1946): 17,781 with 652,435 workers, producing goods worth 16,030,000,000 kronor. It was expected that iron ore exports would reach 12,000,000 metric tons in 1949 (1948: 11,000,000). In 1948, 14,269,000,000 kw.hr. of electricity were produced (11,663,000,000 hydroelectric, including 5,760,000,000 from upper Norrland). Oil was found in small quantities in Höllviken, Skåne. In 1945 industry and crafts occupied 39.7% of the population. The Industrial board production index (1935=100) reached 136 in July 1949.

Swimming.

The rise of Japan to international leadership was the outstanding development in swimming in 1949. Six Nipponese youths scored an upset victory in the men's outdoor championships of the United States, winning four of the five free-style events and cracking five world records.

Twenty-one-year-old Hironoshin Furuhashi led the invaders and stamped himself as perhaps the greatest swimmer in history by cutting the standards for 400 m. from 4 min. 35.2 sec. to 4 min. 33.3 sec., 800 m. from 9 min. 50.9 sec. to 9 min. 35.5 sec., 1,000 m. from 12 min. 33.8 sec. to 12 min. 14.8 sec. and 1,500 m. from 18 min. 58.8 sec. to 18 min. 19.0 sec. He also helped Yoshihiro Hamaguchi, Shigeyuki Maruyama and Shuichi Murayama to nip the time for the 800-m. relay from 8 min. 46.0 sec. to 8 min. 45.6 sec.

Swimmers from the United States swept the other events at the title meet, retaining supremacy at the back and breast strokes and in springboard and platform diving, and they also broke five world records during the year. Allen Stack lowered the back-stroke figures for 100 m. from 1 min. 4.0 sec. to 1 min. 3.6 sec., 150 yd. from 1 min. 30.4 sec. to 1 min. 29.9 sec. and 200 m. from 2 min. 19.3 sec. to 2 min. 18.5 sec.; Keith Carter shaded the mark for 100-yd. breast stroke from 59.4 sec. to 58.5 sec. and Paul Girdes, John Blum, Raymond Reid and John Moore slashed that for the 800-yd. relay from 8 min. 24.3 sec. to 7 min. 55.1 sec.

Only one world record for women fell officially, Greta Andersen, of Denmark, clipping the time for 100-yd. free style from 59.4 sec. to 58.2 sec.

The summer brought a lively renewal of activity in channel

HIRONOSHIN FURUHASHI, Japanese swimmer, during the qualifying trials for the 1,500-m. race in the National A.A.U. men's swimming and diving championships at Los Angeles, Calif., in Aug. 1949. Furuhashi broke three world records at the meet, those for the 400-, the 800- and the 1,500-m. free-style events swimming. Quite a few swimmers of both sexes attempted the gruelling trip from France to England and two men were successful. Fernand Dumoulin, a 34-yr.-old hero of the Belgian underground, lamed by a wound in the leg, undertook the long grind virtually without training and was further handicapped by rough water and several delaying accidents en route, but he stuck gamely to his task and finally attained his goal in 22 hr. 1 min. Philip Mickman, of England, 18, the youngest swimmer ever to conquer the channel, although swept off the course by the tide, effected a landing after a struggle of 23 hr. 48 min. (L. DE B. H.)

Switzerland. A republican confederation of 22 cantons in west-central Europe, Switzerland is bounded by France to the west, Germany to the north, Austria and Liechtenstein to the east and Italy to the south. Area: 15,940 sq.mi. Pop. (1941 census): 4,265,703; (mid-1948 est.) 4,609,000. Languages: mainly German and French. Religions: Protestant 57.6%; Roman Catholic 41.1%; Jewish 0.5%. Chief towns (pop., est. 1946): Berne (cap., 136,700); Zürich (360,500); Basle (170,300); Geneva (137,600); Lausanne (99,300). President of the confederation for 1949: Ernst Nobs.

History.—While the foreign relations of Switzerland in 1949 continued their course without any noteworthy change, attention was focused upon the foreign trade situation and an internal crisis which was both financial and constitutional. There was a noticeable trade recession in the first half of the year. This included a tendency unwelcome to the Swiss, who expect to import more than they export (paying the deficit out of their foreign assets), for imports to sink faster than exports; from July onward indeed the monthly figure for imports more than once sank below exports. In July and September this was, in fact, partly explained by the general expectation that sterling was about to be devalued and that it was therefore worth while delaying one's orders. With its trade necessarily dependent to a large extent upon bilateral agreements Switzerland found its clients quick to get short of Swiss francs while it itself tended to accumulate an uncomfortably large proportion of the world's gold.

Prices remained extremely high and, as the boom period had passed, were felt to be oppressive. The high cost of living was largely because of a policy of protection of the peasants—scarcely 20% of the total population—for whose benefit heavy duties were imposed upon imported food, whereas food exports were subsidized. This caused considerable indignation, and it was additionally felt that the official price-control office at Montreux was unnecessarily bureaucratic in its ways.

The main issue continued to be that of the budget, which was only balanced through taxes based upon emergency legislation which was due to expire at the end of the year. On behalf of the federal government it should be made clear that modern circumstances had enormously increased federal administrative costs and that the constitution did not forbid the direct federal taxes that had been introduced by emergency decrees which, moreover, both chambers and the chief political parties had accepted. Further, public opinion, although it rebelled against the high cost of living, approved of preserving the peasantry as a privileged group; it also attributed aggressive tendencies to the U.S.S.R. and believed that large sums should be spent on an up-to-date army and air force. Finally, it was natural that the federal government should wish to have a new financial order worked out within the constitution before it abandoned the special powers which it had used since the unemployment crisis of 1933.

In a country with the democratic traditions of Switzerland, however, emergency decrees four years after the end of the war were bound to be resented. Already in 1946 two "initiatives" had been tabled which demanded a popular vote on the constitutional issue; the actual voting was, however, constantly delayed by the minister of justice and police who publicly belittled the "initiatives." At last it was settled that the first of them which demanded the confirmation of emergency decrees by a popular vote should be held on Sept. 11, 1949.

On Sept. 11, although only 40% of the electorate voted, the first "initiative" was accepted by 281,961 against 272,359 individual votes, and by 12½ cantons against 9½. The actual majority was a narrow one but it created a constitutional crisis, since the sovereign people had protested against the methods adopted by their elected rulers and approved by their elected representatives. The chambers met later in September and in October, and approved a two-year provisional financial program without which it would be impossible to levy, after the end of 1949, what had become basic taxes. The new program, which abolished the sales tax on essential foods and made other small concessions, was to be submitted to popular approval before the end of 12 months.

On Sept. 11 two other significant events took place. On the one hand an owner of a chain of stores and Switzerland's most active demagogue in whipping up resentment against the government was elected as one of the canton of Zürich's two representatives in the Swiss upper house. On the other the Social Democrats lost control of the municipality of Zürich, which had for many years been regarded as a Socialist stronghold; a week later the devaluation of sterling heralded an employers' attack upon industrial workers' wages on the grounds that some of Switzerland's imports would now be cheaper.

On Dec. 15 Max Petitpierre was elected president of the confederation for 1950 and Eduard von Steiger, minister of justice and police, vice-president of the federal council. (E. WI.)

Education.—(1946–47) Elementary schools, pupils 433,332, teachers 13,692; secondary schools, pupils 75,546, teachers 3,043; universities (1947–48) 7, students 13,182, professors and lecturers 1,343; institutions of higher education 2, students 4,547, teachers 427.

Finance and Banking.—(Million francs) Budget: (1948 est.) revenue 1,800, expenditure 1,787; (1949 est.) revenue 1,423, expenditure 1,428. National debt (Dec. 1948): 10,959. Currency circulation (Sept. 1949): 4,702. Gold reserve (Sept. 1949): U.S. $1,423,000,000. Bank deposits (June 1949): 5,324,000,000 Fr. Monetary unit: franc with an exchange rate (Dec. 1949) of 4.30 Fr. to the U.S. dollar.

Foreign Trade.—Imports: (1948) 4,999,000,000 Fr.; exports: (1948) 3,435,000,000 Fr.

Transport and Communications.—Roads (1949): 10,500 mi. Licensed motor vehicles (Dec. 1948): cars 105,954, commercial vehicles 33,926. Railways (1947): 3,345 mi.; passenger traffic 212,990,000; goods traffic 18,213,000 metric tons. Shipping (Dec. 1948): number of merchant vessels 12, total tonnage 40,518. Air transport: miles flown (1947) 6,067,000, passenger miles (1948) 49,782,000, cargo net ton-miles (1948) 779,000. Telephones (1946): subscribers 744,997.

Agriculture.—Main crops (in metric tons): wheat (1948) 195,000; oats (1948) 65,000; barley (1948) 54,000; rye (1948) 27,000; maize (1947) 10,000; sugar, raw value (1947) 22,000; potatoes (1948) 1,141,000; tobacco (1947) 3,000; grapes (1948) 112,000. Livestock: cattle (April 1948) 1,424,000; pigs (April 1948) 767,000; sheep (April 1948) 170,000; goats (April 1947) 189,000; horses (April 1948) 142,000; chickens (April 1947) 5,025,000. Dairy produce (in metric tons): meat (1947) 133,000; milk (1948) 2,210,000; butter (1948) 13,200; cheese (1947) 41,000.

Industry.—(1948) Industrial establishments 11,364; persons employed 531,353. Electricity (1948) 8,640,000,000 kw.hr.

FILMS OF 1949.—*Life in the Mountains* (*Switzerland*) (Coronet Instructional Films); *Meet the Swiss* (Associated Film Artists).

Symington, William Stuart (1901–), U.S. secretary of the air force, was born on June 26 at Amherst, Mass., studied at Baltimore (Md.) City college, and after serving as a lieutenant in World War I attended Yale until 1923. He worked at an uncle's iron products concern in Rochester, N.Y., and in 1935 became president of the Rustless Iron and Steel Co. in Baltimore. In 1938 he became president of the Emerson Electric Manufacturing Co. in St. Louis, Mo. In 1945 he served successively as chairman of the Surplus War Property board and administrator of the Surplus Property administration. On Jan. 18, 1946, he was named assistant secretary of war for air and on Sept. 18, 1947, first secretary of the air force.

In 1949 Symington was the centre of a prolonged dispute over the merits of the B-36 bomber. In May Congressman James E. Van Zandt noted "reports" that Symington was to resign and head the company making the B-36, which had just been given substantial new contracts. Symington branded the charge a "lie." In August, before the house armed services committee, he challenged Van Zandt to repeat the charges away from the house floor, where they were privileged, to give him "proper recourse." In October the house committee approved the B-36 procurement program, and it was revealed that a civilian navy employee had originated the document that first launched the B-36 probe. On Oct. 18 Symington charged navy officials with imperiling U.S. security by distributing "falsehoods" about defense plans.

Syria. An independent Arab republic, formerly under French mandate, Syria is bounded by the Mediterranean sea, Turkey, Iraq, the Hashemite Kingdom of Jordan, Israel and Lebanon. Area: 72,560 sq.mi. Pop.: (1943 est.) 2,860,400, (1948 est.) 3,750,000. Religions: Moslem 85%; Christian 14%; other 1%. Languages: Arabic is the mother tongue of about 86% of the population, but Kurdish, Armenian, Turkish and Circassian are also spoken. Chief towns (1948 est.): Damascus (cap., 342,000); Aleppo (369,000); Homs (111,000); Hama (82,000); Latakia (the only port, 42,000). Presidents in 1949: Shukri Bey el-Quwatli (until March 30), Marshal Husni ez-Zaim (June 25–Aug. 14) and Hashem Bey Atassi (from Dec. 14); prime ministers in 1949: Khalid el-Azam (until March 30), Muhsin Barazi (June 26–Aug. 14), Hashem Bey Atassi (Aug. 15–Dec. 13), Nazim el-Kodsi (Dec. 24–25) and Khalid el-Azam (from Dec. 28).

History.—On March 30, 1949, a section of the army led by Col. Husni ez-Zaim, the chief of staff, overthrew the government, arresting Pres. Shukri Bey el-Quwatli, the prime minister Khalid el-Azam and other ministers. The frontiers were closed and a curfew was ordered. In the first of many broadcasts Colonel Zaim said that he had acted to save Syria from a despotic regime. On the following day he said that elections would be held as soon as possible; and the frontier with Lebanon was reopened. Zaim appeared before the chamber of deputies on April 1 and received a vote of confidence by a slight majority. Next day he announced its dissolution. A consultative commission was summoned to draft a new constitution.

On April 7 it was announced that the president and prime minister, still under detention, had resigned; and Zaim shortly after formed a cabinet in which he assumed the titles of prime minister, minister of defense and minister of the interior.

On June 25 a referendum was held; Zaim's regime and all its decrees were endorsed and he himself elected president. A government was then formed on June 26 with Muhsin Barazi as prime minister and minister of foreign affairs. The new president also took the rank of marshal.

Syrian finances were in a disastrous condition and heavy taxation was resorted to, including a 15% tax, retroactive to 1940, on the profits of all industrial concerns, businesses and sales of land or houses. Marshal Zaim began consciously to model himself on Kemal Atatürk and openly flouted older Moslem notions of propriety. His popularity began to decline.

On Aug. 14 a group of army officers led by Col. Sami Hinnawi forced their way into the president's and prime minister's residences, whence both were taken out and summarily shot. It was proclaimed that they had been condemned to death by a supreme war council presided over by Colonel Hinnawi and that the army had acted to save the country from the tyrant who had abused his authority, wasted public money and restricted personal freedom.

At a meeting in the defense ministry Hashem Bey Atassi, who had once been president under the French mandate, agreed to form a provisional government. The main duty of the new government was to pave the way for the early election of a constituent assembly to prepare a new constitution.

The government of Zaim on May 16 had ratified the agreement initialled on Feb. 2 between the previous government and the Arabian American Oil company granting wayleave for the Trans-Arabian pipe line. Early in June it signed agreements with the Anglo-Iranian Oil company granting wayleave for a pipe line from Abadan to the Mediterranean and providing for the construction of a refinery at Tartous on the Syrian coast. Hashem Bey Atassi stated on Aug. 16 that his government would neither endorse nor repudiate these agreements, which must come before the new assembly for its decision.

Armistice talks with Israel began in April and an armistice was signed on July 20. (C. He.)

Parliamentary elections took place on Nov. 15: only 39% of the votes were polled, women voting for the first time. In the result no party gained an absolute majority but the constituent assembly of 113 deputies was dominated by the Popular party, which gained 44 seats; the elections were boycotted by the National party; the Ba'th (left-wing) party secured 7 seats. On Dec. 12 the assembly elected Rushdi Kekhya its president, the cabinet resigned on Dec. 13 and on Dec. 14 Hashem Bey Atassi was elected provisional chief of state pending the drafting of a new constitution.

On Dec. 19 a third coup d'état was staged by the Syrian army. Former Colonel, now General Hinnawi, commander in chief of the Syrian army, and his brother-in-law, Assad Talass, undersecretary of state for foreign affairs, were arrested. The leader of the coup, Col. Adib Shishakli, 41-year-old commander of the 1st motorized brigade, declared that the arrested men were plotting against the republican regime in conjunction with foreign elements. Following the failure of Khalid el-Azam to form a cabinet, the premiership was entrusted on Dec. 24 to Nazim el-Kodsi, but he resigned the next day. Hashem Bey Atassi, the provisional chief of state, submitted his resignation on Dec. 26, but the next day the constituent assembly refused to accept it.

A new government was formed on Dec. 28 by Khalid el-Azam with Col. Akram Hawrani, leader of a newly founded Republican party, as minister of defense, and Sami Kabbara, an Independent, as minister of the interior.

Education.—(1946–47) Schools: state 870, pupils 127,502; private 344, pupils 48,133; foreign 55, pupils 5,725; university 1, students 1,722; institutions of higher education 3.

Finance and Banking.—Budget: (1948 est.) balanced at L.S. 128,000,000; (1949 est.) balanced at L.S. 131,000,000. Currency circulation (March 1949) L.S. 240,000,000, (March 1948) L.S. 182,000,000. Gold reserve of the Bank of Syria and Lebanon (June 1949): U.S. $2,800,000. Bank deposits (Dec. 1948) L.S. 93,000,000, (Dec. 1947) L.S. 91,000,000. Monetary unit: Syrian pound with an exchange rate of 45 cents U.S. (Nov. 1949).

Foreign Trade.—(1948, with Lebanon) Imports L.S. 468,000,000, exports L.S. 79,000,000.

Transport and Communications.—Roads (1946): 3,966 mi. Licensed motor vehicles (Dec. 1948): cars 3,951, commercial vehicles 3,385. Railways (Dec. 1948): 530.8 mi.

Agriculture.—Main crops (metric tons, 1948): wheat 550,000; barley 260,000; maize 30,000; rice (1947) 22,000; potatoes (1947) 15,000; cotton 7,000; tobacco 4,000; olives (1946) 42,000; lentils (1947) 39,000; broad beans (1947) 29,000. Livestock: sheep (Dec. 1947) 3,482,000; goats (Dec. 1946) 1,257,000; cattle (Dec. 1946) 371,000.

Syrup, Sorgo and Cane: *see* Sugar.

Table Tennis. In the 1949 world championships at Stockholm, Sweden, Feb. 4–10, the winners were: Swaythling cup for men's teams, Hungary (Ferenc Sido, Joszef Koczian, Ferenc Soos, Laszlo Varkonyi, George Lakatos, capt.); Corbillon cup for women's teams, U.S. (Peggy McLean, Thelma Thall, Mildred Shahian, Jimmy McClure, capt.); men's singles, Johnny Leach (England); women's singles, Gizi Farkas (Hungary), her third victory; men's doubles, Ivan Andreadis and Frantisek Tokar (Czechoslovakia); women's doubles, Helen Elliot (Scotland) and Gizi Farkas (Hungary); mixed doubles, Ferenc Sido and Gizi Farkas (Hungary); men's singles consolation, Ladislav Stipek (Czechoslovakia); women's singles consolation, Peggy McLean (U.S.). Twenty of the 40 nations belonging to the International Table Tennis federation were represented. For the first time South Americans contended for world titles, Brazil sending a men's team and Chileans entering the men's singles. The I.T.T.F. congress changed the service rule to require the ball to be lifted upward by the flat hand instead of dropped, and scheduled the 17th world championships for Budapest Jan. 29–Feb. 5, 1950. (C. Z.)

Taft, Robert Alphonso (1889–), U.S. senator, was born on Sept. 8 in Cincinnati, O., the son of William Howard Taft (27th president of the U.S.). He was graduated from Yale university, New Haven, Conn., in 1910 and Harvard law school, Cambridge, Mass., in 1913. During World War I he served as assistant counsel of the U.S. Food administration, and after the war helped organize relief services to Europe. He served in the Ohio house of representatives (1921–26) and the Ohio senate (1931–32). He was elected to the U.S. senate in 1938 and re-elected in 1944. He was a strong contender for the Republican nomination for president in 1940, 1944 and 1948.

Taft's principal activities in the senate in 1949 included his defense of the Taft-Hartley labour law; his initial support of, and eventual opposition to, the North Atlantic treaty; his efforts to reduce European Recovery program funds; his opposition to the administration's compulsory health-insurance plan, and his efforts to induce the president to use the powers of the Taft-Hartley law to end the autumn and winter coal strikes.

He voted in July against the North Atlantic treaty on grounds that it was "inextricably linked" with arms to Europe and might lead to immediate war with the U.S.S.R. He was successful in preventing administration efforts to rewrite the labour bill when the matter came to a vote in June. He was also one of the senators opposing further dismantling of German factories. As early as September he was industriously campaigning for re-election by making personal appearances in communities throughout Ohio.

Tangier. Tangier is an international and demilitarized zone of Morocco on the southern shore of the Straits of Gibraltar. Area: 232 sq.mi. Pop.: (Dec. 1938 est.) 60,000; (1940 census) 102,306 including 16,509 Europeans; (mid-1949 est.) 150,000 including 30,000 Europeans. Languages: Arabic, French and Spanish. Religion: mainly Moslem. When the one-sided incorporation of Tangier into the Spanish zone of Morocco (Nov. 3, 1940) had been terminated on Oct. 11, 1945, the international administration was re-established with a committee of control composed of the resident consuls general of France, Great Britain, the United States, the U.S.S.R., Belgium, the Netherlands, Portugal and Spain. The soviet representative refused to take his seat on the committee as long as Franco Spain was represented. Italy was readmitted to the committee on March 8, 1948. The committee of control appointed a legislative assembly of 26 members (4 French, 4 Spaniards, 3 British, 3 Americans, 1 Belgian, 1 Dutchman, 1 Portuguese, 3 Jews and 6 Moslems). Tangier remained under the nominal sovereignty of the sultan of Morocco and his representative (the *mendoub*) was Hadj Mohammed el Tazi. Administrator (from Aug. 1948): Jonkheer H. L. F. C. van Vredenburch.

History.—In 1949 Tangier could be described as the only genuine international administration and the only absolutely free money market in the eastern hemisphere. The international regime functioned smoothly, the financial position was prosperous, with a large budget surplus, and the local debt was reduced to less than 0.5% of the yearly revenue. There was no income tax and revenue was raised largely by the flat-rate 12.5% duty on goods imported or in transit. The Moroccan franc, equal to the French franc, was the legal currency but any of the world currencies could be legally bought and sold. By Sept. 1949 the number of banks had increased from 10 before World War II to 81. Private enterprise was the key to Tangier's prosperity, but speculation rather than public-spirited investment seemed to be the rule.

Tariffs. The international pattern of tariffs altered little during 1949. The most important developments during the year were (1) the accession by 11 additional countries to the General Agreement on Tariffs and Trade; (2) the announcement of a third round of negotiations by the countries which were members of the general agreement, to be held in 1950; (3) projects by countries in several regions to establish customs unions; (4) adoption by additional countries of the League of Nations model customs nomenclature and (5) some further tendency to substitute ad valorem tariff rates for duties previously levied on a specific basis.

The most important tariff development during the year was the Annecy Conference on Tariffs and Trade, held in France between April 8 and Aug. 27, 1949. At Annecy, two separate, but related, projects were undertaken. One was the third session of the contracting parties to the General Agreement on Tariffs and Trade; participating in this meeting were the 23 countries which had become the contracting parties to the agreement negotiated at Geneva in 1947. This session was devoted primarily to the consideration of amendments to the general agreement and to matters of procedure and administration.

The other meeting, held simultaneously at Annecy, was the tariff negotiations meeting, attended not only by the 23 contracting parties but also by 11 other countries desiring to accede to the General Agreement on Tariffs and Trade. As at the Geneva conference in 1947, the tariff negotiations were conducted bilaterally; the resulting tariff concessions were ultimately combined to form the Annecy protocol to the general agreement.

Ultimately, 10 of the 11 countries which initially indicated their desire to accede to the General Agreement on Tariffs and Trade signed the Annecy protocol; Colombia had withdrawn its application. In all, 150 bilateral negotiations were concluded between the original contracting parties and the acceding countries and among the acceding countries themselves. Thus, the negotiations at Annecy expanded still further the area of world trade covered by commitments embodied in the general agreement. Moreover, the combined tariff concessions exchanged at Geneva and Annecy covered products accounting for more than two-thirds of the total import trade of the participating coun-ries and for more than half of the total trade of the world.

By the close of 1949, 22 of the 23 contracting parties had igned the Annecy protocol, thus deciding favourably the accesion of the ten acceding countries. Only two acceding countries —Haiti and Liberia—had signed the protocol, and, hence, only he schedules (*i.e.*, tariff concessions) for those two countries ecame effective on Jan. 1, 1950. The protocol provided that he schedules of the remaining eight countries—Denmark, the Dominican Republic, Finland, Greece, Italy, Nicaragua, Sweden and Uruguay—would become effective on the 30th day ollowing their signature.

Both the Havana charter for the International Trade organization and the general agreement embodied provisions designed o encourage the formation of customs unions as well as free-rade areas. Although but one such agreement had come into existence by the close of 1949, the year was, in effect, a period of gestation for customs unions; such arrangements were under consideration for (1) France and Italy, (2) France, Italy and he Benelux union, (3) the Scandinavian countries, (4) South Africa and Southern Rhodesia (5) and four South American countries under the name of Gran Colombia. In addition, extensive preparations had been made for a more comprehensive cusoms union embracing virtually all countries of western Europe.

The Benelux union, formed by Belgium, Luxembourg and the Netherlands, put their common tariff into effect in 1948; in view of the fact that various quantitative restrictions had not been eliminated between their respective territories, however, the hree countries had not yet completely fulfilled their objective of establishing a customs union in the full meaning of that term as set forth in the general agreement. The most ambitious project of this kind under consideration, however, was the proposed customs union of the O.E.E.C. (Organization for European Economic Cooperation) countries. The European customs union study group, constituted in 1947, continued its researches hroughout the year and made considerable progress toward solving the many complex problems which such a joint undertaking would entail, including the establishment of a common nomenclature, agreement on methods of determining dutiable value, determining the type of duties to be employed, the simplification of customs formalities and the like. (*See* also EUROPEAN UNION; ORGANIZATION FOR EUROPEAN ECONOMIC CO-OPERATION.)

France and Italy entered into a treaty in March 1949 to establish, within one year after ratification, a common tariff and to abolish all duties on Italo-French trade. A joint customs council was created to plan for, and supervise, the program. Later, exploratory discussions were held concerning the possibility of a broader union between France, Italy and the Benelux countries. Another project still largely in the discussion stage was nitiated among the Scandinavian countries at the Olso conference in 1948. During the year, also, the Union of South Africa and Southern Rhodesia announced that they had entered into an nterim agreement leading to the establishment of a customs union and the gradual elimination of import duties between the two countries. Similarly, the government of Colombia, together with Venezuela, Ecuador and Panamá, had taken steps preliminary to the formation of a customs union.

In Aug. 1949 the permanent tariff bureau of the European customs union study group submitted the 1949 edition of its recommended *Draft Tariff Nomenclature*. This project constituted a notable addition to the substantial list of countries or areas adopting or contemplating the adoption of the model customs tariff nomenclature first proposed by the League of Nations n 1931. By means of the "Geneva" draft, the League experts had undertaken to provide a standard classification which would serve as a simplified and unified international tariff schedule and which would meet modern economic requirements for all countries.

Some of the countries which had chosen to employ adaptations of the Geneva draft as a basis of their new tariffs were France, the Benelux countries and Iceland. Included among countries making earlier use, at least in part, of the League nomenclature were Czechoslovakia, Denmark, Finland, Egypt, Poland, Sweden and Uruguay. Italy used the new Brussels revision as the basis of its projected tariff, announced in the spring of 1949. Other countries reported to be contemplating the use of the League nomenclature were Argentina, Colombia, Greece, the Scandinavian customs union and Switzerland.

The new *Draft Tariff Nomenclature* was intended to be compulsory for all countries joining the proposed European customs union. In addition to various other differences, the new nomenclature had many refinements to adjust for advances in industrial and scientific techniques during the past two decades and thus attempted to provide satisfactory classification for new products such as plastics, synthetic textiles, antibiotics, aircraft and light metals.

The world-wide increase in prices which had occurred since World War II, had focused attention on one weakness of duties levied on a specific basis. Such duties quickly became out of date and consequently required frequent readjustment to prevent their burden from becoming heavier or lighter than it was intended to be. Moreover, during periods of rising prices, countries utilizing specific duties often found their revenue positions seriously impaired. Ad valorem rates of duty, on the other hand, always responded to changes in the price level inasmuch as they bore a constant relationship to the value of the imported merchandise.

During 1949, increases in duty in Bolivia, Peru and Iraq, all affecting a considerable range of items, appeared to have been made principally to restore the revenue-raising capacity of their tariffs or to reinstate the measure of protection originally afforded by the duties themselves.

Other countries made more extensive modifications of their tariff schedules by resorting more completely to ad valorem duties. Some of these changes were made in conjunction with the adoption of new nomenclatures. Typical of such action were the new tariffs of France and Benelux, which were based predominantly on ad valorem duties. During 1949, the most notable change-over of this type was that embodied in the newly projected tariff of Italy. Similarly the new import tariff instituted by Angola provided for the almost exclusive use of ad valorem duties. Saudi Arabia, however, added a general ad valorem levy to be collected in conjunction with the specific duties previously in force. Moreover, in recommending the Brussels nomenclature, the European customs union study group indicated that it should be employed in conjunction with an ad valorem schedule of duties.

Other than the commitments for tariff reductions at Annecy, the changes in duty effected by individual countries were not of sufficient moment to constitute any marked difference in the world trading system. Virtually no country made a general upward or downward revision of duties in 1949, except, as noted, to compensate for the effect of currency depreciation on schedules based on specific duties. Alterations affecting duties on a substantial range of commodities, however, were made in several countries. These changes resulted more frequently in increased than in decreased duties. Increases affecting a substantial list of commodities occurred in Chile, Honduras, Panamá, Venezuela, Finland, France, Portugal, Iraq, Malta, Indonesia and Spain. Decreases were made by Benelux, French Somaliland and Ceylon. As occurs almost every year, there were many piecemeal and minor changes raising or lowering rates of duty on individual import items in various countries. (*See* also INTERNATIONAL TRADE.)

Taxation.

Transition from a postwar period of surplus revenues and debt reduction to the recurrence of deficits marked the federal government's fiscal year 1949. The Revenue act of 1948, enacted over a presidential veto, was estimated to have reduced federal revenues from individual income taxes by $5,000,000,000 per year. Faced, in Jan. 1949, with the possibility of a deficit, but chiefly as a measure of inflation control, Pres. Harry S. Truman recommended to the convening 81st congress measures to increase revenue from taxation by $4,000,000,000, chiefly by increased taxes on corporate income, supplemented by increased estate and gift taxes. The president also recommended careful study of the increase of rates for the individual income tax in the middle and upper brackets.

A congress which showed slight inclination to increase taxes and which had failed to act upon the recommendations of January received further presidential tax advice in July. By this time, the fiscal year 1949 had closed with a deficit neighbouring $1,800,000,000, and a recession in business activity and in employment had become clearly defined. Taxes as a measure for inflation control were no longer desired, and in his midyear economic report the president advised that "No major increase in taxes should be undertaken at this time." Estate and gift taxes were an exception, however, and the president again advised increases in their rates, to recover the revenue lost under the Revenue act of 1948. No response was forthcoming from congress.

By the end of 1949 the business decline of the early part of the year had levelled off, and the department of commerce estimated that the year would show a national income of $222,000,000,000, a decline of only 2% from 1948. Nevertheless, governmental expenditures had continued to run in excess of receipts and a deficit estimated at $5,500,000,000 was in prospect for fiscal 1950 unless authorized expenditures should be sharply curtailed or taxes increased. At the beginning of an election year, neither alternative seemed appealing to congressional opinion; greater support for a program of reducing federal excise taxes was manifest.

Legislation.—As tax rates were left unchanged in 1949, so, too, was most of the structure of the internal revenue code. The Tax Administration Act of 1949, enacted in August, made no drastic changes in tax procedure, but did add a degree of flexibility in administration which was expected to be helpful both to taxpayers and to the bureau of internal revenue. Under its terms, local collectors might be authorized to make refunds of taxes up to $10,000 without reference to the commissioner in Washington, D.C., and field representatives of the bureau might be authorized to issue assessments; the formality of an oath on returns, dispensed with for individual income taxpayers since 1942 in favour of a simple signed statement made under penalties of perjury, might be dispensed with on those returns, such as corporate, fiduciary and partnership income tax returns and estate and gift tax returns, on which it had continued to be required until 1949; the bookwork burden of making monthly returns which was imposed on many businesses subject to federal excise taxes was lightened by a provision authorizing the commissioner to prescribe the period which a return should cover—it was contemplated that in many cases excise tax returns would thereafter be on a quarterly rather than a monthly basis.

The Technical Changes act of 1949, enacted in October, contained few provisions of widespread significance. For individuals possessed of large fortunes, and for their advisers, it did attempt to provide a legislative settlement for a series of estate tax controversies which had come to a head with two decisions by a sharply divided supreme court in Jan. 1949 (the *Church* and *Spiegel* cases). One of these over-ruled a decision which had stood since 1930; the other approved what many lawyers and lower-court judges believed to be an extreme position taken by the bureau in its attempt to subject to estate taxes certain technically contingent family trust settlements made by the donor during his life. To the protests of many taxpayers that they had acted in reliance on the supreme court's 1930 decision in the one case, and on a more middle-of-the-road view of the tax law in the other, congress replied by a reformulation of the relevant estate tax provisions which were favourable to taxpayers with regard to past transactions, but which sanctioned the government's very broad interpretation of the taxing act with respect to transactions after Oct. 7, 1949. Some sceptical specialists, while applauding the spirit of compromise which moved congress to act, doubted that the legislation hastily drafted in the closing days of the session was formulated with a clarity adequate to dispel the controversy frequently engendered by the conflict between the acquisitive instincts of the bureau of internal revenue and the careful thrift of estate planners in cases often involving estate taxes running into tens or hundreds of thousands of dollars.

Tax Treaties.—Carrying forward a policy designed to facilitate international trade, to encourage international investment and enterprise, the state department and the bureau of internal revenue continued to negotiate with other nations treaties designed to eliminate or minimize the barrier of international double taxation, particularly in the fields of income and estate taxation, and at the same time to prevent evasion. At the beginning of 1949 there were in effect income tax treaties with Denmark, France, the Netherlands and Sweden, and income and estate tax treaties with Canada and the United Kingdom. Awaiting ratification were income tax treaties with Belgium and New Zealand, an income and estate tax treaty with the Union of South Africa and a treaty, plus an amendatory protocol, with France covering estate taxes and modifying the earlier income tax treaty. Negotiations with other nations were in progress.

In 1949 ratifications of the pending treaty with France were exchanged, and it became effective. The income tax treaty with Belgium, signed in 1948, was submitted to the senate, and an income and estate tax treaty with Norway was signed and submitted for ratification. Preliminary conversations, or negotiations, looking toward income and estate tax treaties with three Latin-American nations, Brazil, Colombia and Cuba, were announced by the state department in June and July, and with Argentina in Dec. 1949.

Court Decisions.—The supreme court continued to exercise sparingly its discretionary jurisdiction to review tax cases; in those which had been reviewed by the supreme court, the government had maintained, but with one perhaps notable exception, a uniform record of success in recent years. This almost unbroken record of government victories in supreme court tax litigation had probably been of more widespread and pervasive effect in the administration of the tax laws than had been the decision in any specific case. The 1949 tax decisions for the most part involved points not of importance to the generality of taxpayers, corporate or individual. The decision which was probably of most widespread importance was the first in several years in which the net effect was a defeat for the government. This was a case involving family partnerships, *Commissioner* v. *Culbertson.* In 1946 the supreme court, in the *Tower* and *Lusthaus* cases, approved, in each case, the efforts of the commissioner to disregard a family partnership and tax to the husband the entire partnership income from a husband-and-wife partnership. The result of this disregard of the partnership was that the aggregate income thus attributed to one partner fell into higher tax brackets and increased the net yield to the government. To brush aside the partnership, the court purported to look to the original source of capital contributed to the partnership, services to the partnership and management control; it gave little or no weight to the fact that the partnership was an effective one under the state law of its origin, entailing liability upon each partner and enforceable rights to income and to partnership property upon dissolution. The commissioner thereafter applied this policy with vigour, and the rather indefinite criteria of judgment left the tax status of most family partnerships in doubt, or with the certainty only that the entire partnership income would be taxed to one partner. The Revenue act of 1948, permitting split income returns for husband and wife, minimized the importance of the *Tower* and *Lusthaus* decisions in husband and wife partnerships, but did not deprive them of all force. Family businesses are often operated in noncorporate form, and frequently make the transition from generation to generation by a series of father-son partnerships. The *Culbertson* case involved a situation of this type; the commissioner's attempt to reconstruct the family ranching partnership, organized and publicly announced a year earlier, by taxing the whole income to the father and eliminating, for tax purposes, two sons absent in the army and two younger sons who devoted their summers, but only their summers, to the ranch, was unsuccessful. In an opinion which seemed expressive of a new attitude, somewhat less ready than formerly to uphold the administrative determinations of the commissioner, the court indicated that the test of an effective partnership, for tax as for other purposes, was a joining together in an enterprise to share profits or losses.

State and Local Taxation.—Increasing costs of government and increasing demands upon government had caused the steady increase in state and local taxes to continue. Distressing to many economists and other students of government was the frequency with which state and local governments seeking new or increased revenues turned to consumer taxes—either general or special sales taxes, which tended to bear most heavily upon lower and middle-income groups.

Indicative of the trend of state and local taxation and the increasingly important part such taxes were playing in the general fiscal problem were figures released in 1949 showing that though federal tax revenues (excluding pay-roll taxes for social security) reached their peak of $42,477,000,000 in the wartime year of 1945, and thereafter dropped off to less than $40,000,000,000 annually, total federal, state and local tax revenues (excluding pay-roll taxes) reached a peak of $53,246,000,000 in postwar 1948, as compared with $51,670,000,000 in 1945. Estimates of 1949 total revenues put them on levels comparable with those of 1948. Figures released by the bureau of the census in Nov. 1949 show with striking clarity the postwar trend in state taxation, and the part sales and gross receipts taxes play in it, as follows:

	Amount Collected (In millions) 1949 (est.)	1948	1947	1946
State tax collections (excluding unemployment compensation)	$7,369	$6,732	$5,721	$4,935
Sales and gross receipts taxes	4,363	4,045	3,415	2,806

"GUEST OF HONOR," a 1949 cartoon by Justus of the *Minneapolis Star*

In per capita terms, the burden of state taxes (including pay-roll taxes) for 1949 ranged from a high of $92.19 per person in Louisiana, to a low of $35.92 in Nebraska, with an average of $57.43.

The change in the level of state taxation may be observed by comparing these with 1937 figures, when California ranked highest with a $51.99 burden per capita and South Carolina lowest with $11.35, and the average was $30.75.

State legislative activity in 1949 was frequently directed toward increasing rates on the more prevalent forms of taxation. Gasoline taxes existed in every state, ranging from a low of 2 cents per gallon in Missouri (subject to referendum action in 1950 which might raise it to 4 cents) to a high of 9 cents in Louisiana. In 1949, 13 states increased their rates, the most common increase being 1 cent per gallon. Cigarette taxes existed in 39 states prior to 1949, ranging from a low of 1 cent per standard pack in West Virginia to a high of 8 cents in Louisiana. In 1949 such taxes were imposed for the first time by Delaware (2 cents) and the District of Columbia (1 cent); ten states increased their rates, and Arkansas decreased its rate from 6 cents to 4 cents. General sales, use or gross receipts taxes were imposed by 30 states and the District of Columbia. Florida and the District of Columbia were 1949 additions to the ranks of those jurisdictions imposing such taxes; rates were increased in four states in 1949. Taxes on personal income of varying scope were imposed by 32 states and the District of Columbia; 1949 witnessed rate increases in 9 of these states. In addition to such state taxes, a growing number of cities and counties imposed additional local taxes on sales generally, or on the sale of such products as cigarettes and gasoline.

One of the difficulties in the collection of state and local taxes had been that in the case of migratory taxpayers, the courts of one state usually would not entertain a suit by another state or its municipal subdivisions to collect taxes asserted to be owed. To facilitate collection in such cases three states (Maine, Minnesota and Tennessee) in 1949 enacted statutes permitting those states granting a reciprocal privilege to bring suits for taxes in their courts. Alabama, Oregon and Wisconsin had enacted similar legislation in 1947, and Missouri and Oklahoma in earlier years. Bills proposing such legislation were introduced in Connecticut, Florida and Iowa in 1949 but failed of passage.

To facilitate collection of state cigarette taxes on cigarettes purchased by mail order from states with low cigarette taxes, or none at all, congress passed a bill requiring interstate shippers of cigarettes to supply appropriate information to the tax authorities of the state of destination.

Canada.—A new income tax act, the reduction of individual income tax rates and the increase of personal exemptions, a changed corporate income tax rate structure and the repeal or reduction of many excise taxes marked important changes in the dominion tax structure during 1949.

On Jan. 1, 1949, the Income Tax act, enacted in June 1948, became effective in the Dominion and replaced the Income War Tax act, which, with many amendments, had been in effect since 1917. The new act was not intended to effect great change in substance but to codify and clarify the old, and particularly to limit the scope of administrative discretion; the broad scope of ministerial discretion permitted had been a basis of frequent criticism of the former act. Administrative regulations were allowed under the new act, and were issued from time to time in 1949, but the power to make them was limited to the governor in council, and their publication in the *Canada Gazette* was required.

Of more immediate importance to Canadian taxpayers were the tax reductions presented in the budget resolutions and subsequently implemented by statute. Personal exemptions for the income tax were raised from $1,500 to $2,000 for married persons, and from $750 to $1,000 for others; exemptions for dependents were raised from $100 and $300 to $150 and $400. The minister commented that this would relieve about 750,000 taxpayers of all income tax liability. Personal income tax rates were reduced to range from 15% on taxable income of $1,000 or less to 80% on taxable income of more than $400,000; the former rates had ranged from 10% on the first $100 of taxable income, but reached 20% at the $500 level, and applied the maximum rate of 80% to taxable income in excess of $250,000. Corporation income tax rates were changed from a flat 30% rate to 10% on the first $10,000 of taxable income, and 33% on all over that. Counterbalancing the resultant increase in corporate taxes for corporations with income of more than $77,000 was a provision allowing an individual taxpayer to deduct from his income tax otherwise payable 10% of his income from dividends paid by corporations liable for the corporation income tax, so that the corporation's increased tax would be more than offset by the credit allowed its shareholders if appreciable dividends were declared.

Reductions in excise taxes correspond to income tax reductions. Among other reductions, the tax on luggage, fountain pens, automatic pencils and desk accessories was reduced from 35% to 10%; the tax on toilet articles, jewelery, china and similar wares was reduced from 25% to 10%; taxes on cable, telephone and telegraph messages, on transportation tickets and accommodations, as well as on soft drinks, chocolate, candy, confectionery and chewing gum were removed altogether. (*See* also BUDGET, NATIONAL; DEBT, NATIONAL; LAW.)

(E. J. BR.)

Great Britain.—In the United Kingdom taxation receipts continued their uninterrupted postwar rise. Actual receipts during 1948–49 amounted to £3,667,000,000, an increase of £155,000,000 compared with budgetary estimates. As in previous years this increase was mainly the result of the satisfactory yield of the income tax which was £1,367,000,000, compared with £1,189,000,000 for the previous fiscal year, and exceeded budgetary estimates by £58,000,000. Practically all other main taxation items showed increases. This was partly caused by the rise of prices and partly by the increase in production. Progress by the inland revenue department in its effort to catch up with wartime arrears also helped. On the basis of existing taxation the total receipts from taxes during 1949–50 were estimated at £3,655,000,000, a decline, on balance, of about £12,500,000, the result of the anticipated fall of the yield of the special contribution, death duties, stamp duties, profits tax and excise. On the other hand, a further increase of the proceeds of income tax, surtax and customs revenue was anticipated. Changes in taxation in the budget for 1949–50 disappointed those who expected substantial concessions in order to compensate workmen for abstaining from pressing wage claims. The only concession of this nature was a slight reduction of the beer duty. The proposed simplification of death duties was expected to produce an additional yield of £11,000,000; but the repeal of some obsolete stamp duties was expected to cost £1,500,000. After allowing for these and other changes the taxation receipts for 1949–50 were estimated at £3,632,000,000.

During the three quarters ended Dec. 31, 1949, the yield of income tax at £562,100,000 showed an increase of £3,800,000 compared with the corresponding period of 1948. Surtax increased by £12,300,000 to £48,300,000, death duties by £11,500,000 to £143,400,000, profits tax by £60,300,000 to £200,200,000. On the other hand, stamp duties yielded £3,400,000 less at £38,900,000, excess profits tax declined by £37,700,000 to £31,800,000, special contribution by £15,300,000 to £17,100,000, customs by £13,000,000 to £611,900,000 and excise duties by £25,100,000 to £526,700,000. Generally speaking, direct taxes showed better results than indirect taxes.

Commonwealth.—In Australia total revenue for the year ended June 30, 1949, was £A535,000,000, which was £A43,000,000 above budgetary estimates. It reflected the rapid rise in commercial turnover and incomes but was partly caused by the overtaking of taxation arrears. Revenue from the sales tax was particularly buoyant.

In Ceylon, on July 14, 1949, the finance minister announced the government's decision to reduce customs duties and income tax on lower incomes. This was decided in spite of the reduction of the revenue surplus from Rs. 32,000,000 in 1948–49 to Rs. 2,000,000 in the estimates for 1949–50.

India's budgetary deficit for 1949–50 was estimated at £20,000,000. To deal with it, the government introduced new excise duties on tea, cigarettes, coffee and tires. The clothes export duty was converted into an ad valorem duty of 25%; handloom clothes were exempted. Export duties on oilseed and vegetable oil and import duties on automobiles were raised; the latter from 45% to 50%.

In New Zealand taxation yielded in 1948–49 £N.Z.130,400,000 and estimates for 1949–50 were £N.Z.132,700,000. For some years in succession the yields of taxation had exceeded budgetary estimates, because the finance minister had not budgeted for the continued rise of prices and of business activity. In the budget for 1949–50 some moderate concessions were made in respect of the amusement tax.

Europe.—In the Czechoslovak budget for 1949 the outstanding change in taxation was the unification of the various types of purchase tax, such as turnover tax, luxury tax, railway transport tax, etc. The new unified tax was expected to yield 50,713,000,000 koruny, compared with the yield of the old turnover tax of 12,426,000,000 koruny in 1948. Considering that the total revenue in 1949 was estimated at 89,320,000,000 koruny, against 56,895,000,000 koruny in 1948, it became evident that the country's fiscal system was now based overwhelmngly on this new turnover tax. Accordingly, the yield of direct axes was expected to decline from 16,621,000,000 koruny to 14,791,000,000 koruny and that of stamps from 4,679,000,000 koruny to 2,094,000,000 koruny.

In France total revenue for the fiscal year 1948–49 was estimated at 1,250,000,000,000 fr., compared with 924,000,000,000 fr. for 1947–48. Taxation receipts alone increased from 769,000,000,000 fr. to 1,069,000,000,000 fr. Devaluation of the franc in 1948 and the continuous rise in prices was chiefly responsible for this rise. At the end of 1949 the government introduced new taxes to eliminate the budgetary deficit. They included a tax on transactions of government transactions—an unusual instance of a government taxing itself—a tax on undistributed profits and a tax on road transport.

In Italy the government was experimenting with a change in the system of assessment of income tax. Hitherto the presumption had been that everybody declared only a fraction of his income. In July 1949 the finance minister, Enzio Vanoni, proposed a "new deal" to taxpayers for a more equitable assessment of taxable incomes. Under the existing system those who were honest enough to declare their full earnings, or those who were not in a position to conceal part of their earnings, bore an unduly heavy burden. In the future the taxpayers were to be pressed for more accurate information but in return the rates would be lowered. Thus, for an income of L. 1,000,000 the rate would be reduced from 18% to 13%. Notwithstanding such a substantial reduction the government hoped to increase the yield of income tax through less evasion. The new system was to operate retrospectively; but if the evasion was not in excess of a certain amount there would be no supplementary assessment on past incomes.

The Netherlands, having succeeded in balancing its budget, adopted the course of shifting the burden slightly from direct to indirect taxation. There was a moderate cut in the tax on income from commerce and wages and an increase of the turnover tax by ½% to 3½%. The gasoline excise duty was also raised. The formula adopted was that taxation must be shifted from earning to spending, to strike a fairer balance between producers and consumers.

Portugal introduced a new purchase tax for the first time in its fiscal history. The object was to use the proceeds to create an export subsidy fund. There was to be a tax on motor vehicles, ranging between 15% and 50% of their retail prices.

Spain increased direct taxation by 5% from the beginning of 1949, in order to provide means to extend social insurance. In the budget for 1949 direct taxation was estimated at 6,185,000,000 pesetas and indirect taxation at 6,553,000,000 pesetas.

During the brief period between the devaluation of many commonwealth and European currencies and the end of the calendar year there was no evidence of any change in the yield of taxation. Nor did measures adopted by most governments following devaluation include new taxation. For the most part the budgetary effort to ensure the success of devaluation aimed at cuts in expenditure rather than the introduction of new taxes, the assumption being that the rise in prices as a consequence of devaluation would in any case ensure an increased yield of both direct and indirect taxes. An alternative to raising taxes was the raising of prices of controlled goods (for example, bread in Great Britain and gasoline in France) to absorb consumers' purchasing power and to avoid increasing the burden of subsidies. (P. Eg.)

Tea.

Apparent civilian per capita consumption of tea (all imported) in the U.S. in 1949 was five-tenths pound, 102% as much as in 1948, but only 84% of the prewar level. Imports, mostly from India and Ceylon, amounted to 89,062,000 lb. in 1948–49, 14% larger than the 78,449,000 lb. of the previous year. But imports for the calendar year 1949 were indicated at a level of about 89,000,000 lb., 3% less than the 91,378,476 lb. of calendar year 1948.

World tea production in 1949 was preliminarily estimated at nearly 1,000,000,000 lb., slightly more than prewar and 1948. Preliminary figures indicated that the 1949 crop was larger in North India and Indonesia, not much changed elsewhere.

Tea prices were strong in the latter part of the year, influenced largely by increased consumption in the United Kingdom, where the ration was increased. (J. K. R.)

Telegraphy.

A program of mechanization and other plant improvements costing $80,000,000 and increasing the capacity and vastly improving the speed and efficiency of U.S. telegraph service was pressed forward toward completion in 1949.

W. P. Marshall, president of the Western Union Telegraph company, proposed to congress the adoption and implementation of a national policy directed toward a single system of domestic and international record communications. The system would be under private management, with appropriate government regulation for the protection of the public and with Western Union as the nucleus around which such a system would be developed, ensuring continuing and more effective competition with telephone and air-mail services.

To accomplish this result, it was proposed that:

1. Subject to enabling legislation and other essential considerations, Western Union would offer to purchase the international telegraph facilities of the American Cable and Radio corporation, RCA Communications, Inc., and any other international telegraph carrier operating in the United States.
2. Subject to the approval and co-operation of the national defense establishment and government policy considerations, Western Union would provide a comprehensive system for handling all of the government-operated communications. This would be an integral part of a co-ordinated system of domestic communications which would utilize all new technological methods and be geared to military requirements.
3. Subject to financial negotiations and regulatory considerations, Western Union would purchase the telegraph business of the American Telephone and Telegraph company, including primarily the business known as Teletypewriter Exchange service (TWX).
4. To the extent that required private capital might not be available to ensure accomplishment of these objectives, long-term government financing would be provided at an interest rate designed to compensate the government for the cost of the money borrowed.

Congress was urged to remove the 25% tax imposed on telegraph users during World War II to discourage use of the service thus freeing facilities for the handling of vital war traffic.

High-Speed Switching System.—Three big selective high-speed switching centres were placed in operation in 1949 at Detroit, Mich., Los Angeles, Calif., and New Orleans, La., completing 14 of a national network of 15 centres, each to handle telegrams to and from one or more states. The fifteenth was planned for Portland, Oreg. The centre at Oakland, serving California, was expanded and improved by new installations in 1949. In the switching system, telegrams are typed only at the point of origin and then flashed through the switching centres to their destinations without manual retransmission.

An important improvement installed in 1949 was a means of switching messages through the message centres and over the lines to patrons' offices. The Western Union system uses tape teleprinter operation, but the teleprinters in many customers' offices are page printers. For that reason, when telegrams are switched to customers with page printers, automatic machines are used to translate the characters not having common locations on tape and page teleprinter keyboards and to move the page up at the end of each line.

Another new feature of the centres was a system for switching "books" (a number of telegrams with the same text); this included equipment which automatically inserts the addresses while transmitting "book" messages.

Carrier Systems.—Through the use of carrier systems, it became possible to send as many as 288 telegrams simultaneously over a single pair of wires, or more than 2,000 over a microwave radio beam system such as Western Union had in operation, with towers about 30 mi. apart, between New York, N.Y., Philadelphia, Pa., Washington, D.C., and Pittsburgh, Pa. To interconnect the new switching centres many additional carrier systems were installed in 1949. About 1,650,000 channel mi. of carrier systems were in operation, and 200,000 more were planned for 1950.

Desk-Fax.—To speed the pickup and delivery of telegrams, and make telegraph service even more convenient and accessible, the Desk-Fax, a miniature facsimile machine, was installed in business offices in nine cities in 1949. The Desk-Fax brings world-wide telegraph and cable facilities within arm's reach of the customer.

Privately Leased Wire Systems.—Private wire telegraph systems were leased to an additional number of large companies in 1949. Some previously established systems were expanded and modernized with push-button and automatic switching techniques. New high-speed switching centres were installed in the nation-wide networks leased to the United States Steel corporation, United Air Lines and General Electric company.

Rates.—Conforming to the desire of the Federal Communications commission to eliminate inequalities in the telegraph rate structure, Western Union filed with the commission on Dec. 15 new rates providing equal charges for equal distances, to become effective Feb. 1, 1950.

(W. P. Ma.)

British Commonwealth.—The final legislative step in the co-ordination of the nationalized overseas services in the United Kingdom, Canada, Australia, New Zealand, India and Southern Rhodesia was taken on May 31, 1949, when the Commonwealth Telegraphs bill became law. This act provided for the integration on April 1, 1950, of the operations of Cable and Wireless, Ltd., in the United Kingdom with those of the post office and for the establishment of the Commonwealth Telecommunications board to co-ordinate the operations of the services in various countries. After April 1, 1950, Cable and Wireless, Ltd., would remain as a government-owned commercial company operating the cable network and the wireless services in the British colonies and certain foreign countries. It would continue to operate the United Kingdom cable station.

Considerable progress was made in the development, production and distribution of new equipment, including cable channelling units, cable code converting transmitters and double current cable code sending and receiving units. Further progress was also made in 1949 toward maintaining and developing the company's 155,000 nautical miles cable system. Direct cable service was restored between London and Hongkong, avoiding the need for retransmitting messages at Singapore. Considerable work was done towards restoring the Mediterranean, South American and West Indian systems.

On the wireless side, progress was made toward expanding the Barbados and Colombo relay stations and toward building a relay station at Nairobi, Kenya, to provide an alternative circuit for the London-Singapore direct service.

The whole of the external telecommunications services at Hongkong was co-ordinated. Several new wireless circuits were opened to meet requirements arising from the developments in China. Additional radiotelephone circuits were opened to San Francisco, Calif., and via Colombo, Cey., to London. The company assisted the government of Pakistan to establish overseas radiotelegraph and radiotelephone circuits.

New transmitting and receiving stations were erected in Cyprus. In addition to radiotelegraph and radiotelephone circuits, Cable and Wireless (which operated the inland telephone as well as the oversea services) took over responsibility for civil aviation communications in the colony.

Following the opening in late 1948 of radiotelephone service between Accra, Go. Cst., and Lagos, Nig., both stations were linked with Sierra Leone early in 1949; a circuit was opened between Bathurst and the other three stations; and, through Accra, connection was provided with London. Many extensions were opened to the West Indian radiotelephone services. On Sept. 1, Cable and Wireless opened a direct phototelegraph circuit between Athens, Greece, and London.

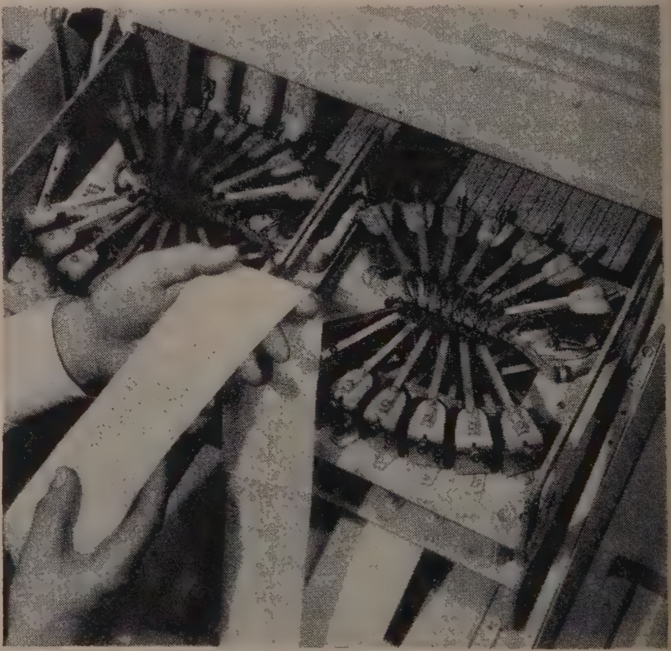
The United Kingdom was a party to the International Telegraph conference which met in Paris from May–July, 1949. The principal decisions (to come into force on July 1, 1950) were the unification of rates for ordinary telegrams (plain, code and cypher), the abolition of deferred telegrams and the amalgamation of the existing two classes of letter telegrams in the extra-European regime in a single class. Subsequently a British Commonwealth-United States governmental Telecommunication meeting was held in London to revise the Bermuda agreement of 1945.

(A. S. A.)

Telephone.

With further substantial results produced by postwar improvement and expansion, U.S. telephone service at the end of 1949 was generally the best and most complete in history. As 1950 began, there were more than 40,000,000 telephones and 160,000,000 conversations a day; there was no distance limit.

Long distance calls, as 1949 ended, were being completed at an average speed of about one and one-half minutes, close to the prewar best. A contributing factor was the further extension of operator toll dialing. A record 95% of all toll calls were being put through while the calling person held the line. Local service also approached the prewar mark in quality, with increased operator experience and the installation of large amounts



TAPE-PUNCHING EQUIPMENT for the automatic message accounting system devised by the Bell Telephone laboratories for use in telephone billing. The new system was introduced in the Philadelphia, Pa., area late in 1948 and was being extended to other parts of the Bell system in 1949

Source: "Telephone Statistics of the World" (American Telephone and Telegraph Company, Jan. 1, 1949).

of new plant and equipment combining to bring speed and accuracy close to all-time top levels.

More than 2,400,000 telephones were added to the U.S. telephone network in 1949, bringing the number added since the war to more than 13,500,000. Some 375,000 of the 1949 additions were in rural areas. Of the total of about 40,600,000 telephones, more than 33,300,000 were served by the Bell system and the remainder by 5,700 independently-owned telephone companies.

The latest available world statistics, compiled as of Jan. 1, 1949, estimated the world total at nearly 66,000,000 telephones, of which nearly 60% were in the United States (*see* table).

Plant and Equipment.—The large volume of construction required to meet the public's telephone needs was indicated by the fact that, in the Bell system, more than 800 building construction projects, ranging in size from small community dial offices to large central office buildings, were completed in 1949. Some of the projects involved additions and alterations to existing buildings.

Shipments to the Bell system operating companies during the year by Western Electric company, the system's manufacturing and supply unit, included nearly 50,000,000,000 conductor feet of exchange cable and enough local central office equipment to serve about 2,300,000 telephones. Conversions of central offices from manual to dial operation continued, bringing the proportion of dial telephones in the Bell system to well over 70%.

Nearly 9,000 toll circuits were added during 1949 by the Bell companies, including the Long Lines department of the American Telephone and Telegraph company, bringing the Bell system total of such circuits to about 100,000.

As 1949 ended, 70% of the applications for telephone service were being filled the same month as received. Because of the continued high demand, the Bell system still had about 790,000 unfilled orders on hand, and more than 2,000,000 requests for individual lines or other higher classes of service. However, the telephone companies in many areas were nearly clear of held orders for the first time since before World War II.

The telephone industry spent about $1,150,000,000 in 1949 for service improvement and expansion, bringing to about $10,500,000,000 the total amount of money invested in plant and equipment. This required the raising of hundreds of millions of dollars in new capital during the year. Many telephone companies, still trying to catch up with higher postwar operating costs, continued to find it necessary to seek increased telephone rates in order to obtain earnings sufficient to attract and protect equity capital.

Rural Developments.—With about 375,000 telephones added in rural areas in 1949, about half of the nation's farms now had telephone service—twice as many as in 1940. As 1950 began, rural telephone gain in the Bell system was continuing at the rate of more than 1,000 each working day; 76% of all Bell system rural customers were on lines with eight parties or less; 90% had improved ringing (they heard the rings of fewer parties on their line); and 90% were using lift-the-receiver telephones instead of the crank-type.

Technical Developments.—The year also saw significant progress in the development of new techniques and devices aimed at improving service and making it as economical as possible to the user. Bell Telephone laboratories developed a new and better telephone instrument. Field tests of a limited number of these telephones were scheduled to be carried on during 1950.

An important transmission feature was an equalizer which automatically adjusts the sound level to compensate in part for the distance between the telephone and the central office. The dial has the number and letter prefixes outside the finger wheel and is sloped at a lower angle for better visibility. A ringer volume control enables the subscriber to adjust the loudness of the ringing tone to suit his needs.

The laboratories also developed a more comfortable and better lighted and ventilated telephone booth. A sealed-in ceiling light fixture equipped with a directive lens concentrates light on the writing shelf and telephone instrument. A louver in the door frame header provides for ventilation; optional equipment includes a blower which changes the air approximately three times a minute.

A new vacuum tube, capable of relaying a wider band of radio microwave signals over and over again to span longer distances than before, was also developed by the laboratories. Known as the close-spaced-triode (grid and cathode separated by only one-fifth the diameter of a hair) the new tube formed the heart of the improved relay equipment being installed in the New York-Chicago-Omaha radio relay system. The new equipment permitted simultaneous relaying of six television programs or thousands of telephone conversations through a single relay antenna.

Another transmission development was a new voice frequency repeater. Used extensively in telephone plant, repeaters were located at regular intervals on long distance circuits to amplify the voice signals progressing along the route. The new repeater, employing war-developed miniature techniques, was not much larger than the vacuum tube alone of its predecessor, and was less costly to make, occupied less space in repeater buildings and simplified maintenance.

In Nov. 1949, Boston, Mass., became the sixth major toll dialing centre in the Bell system's plan for nationwide dialing of long distance calls by operators. The other five, in order of installation, were Philadelphia, Pa. (1943), New York, N.Y., and Chicago, Ill. (1948), Cleveland, O., and Oakland, Calif. (1949). These interconnected networks, together with other smaller systems, by the end of the year enabled operators to dial straight through to distant telephones in about 600 cities and towns. Nearly 30% of the nation's long distance calls were being handled by this method.

Construction of the coaxial cable and radio relay network for telephone and television transmission continued to move forward in 1949. By year-end, the Bell system television network mileage had grown to about 8,500 channel miles, as compared with about 3,500 mi. at the end of 1948. The number of major cities connected to the network had risen from 14 to 25. Substantial progress was also made on construction of the Bell system's New York-Chicago-Omaha microwave radio relay system, to be used for telephone as well as television transmission.

Mobile telephone service by the end of 1949 was available in about 150 areas, with the Bell companies serving more than 7,500 vehicles and other mobile units and handling about 230,000 calls a month.

Overseas telephone service also continued to expand. Foreign points to which service was extended during 1949 included Hong Kong, Capetown, Tangier, Malta, Iran and the Bahrein Islands in the Persian gulf. By year-end, calls were being made at the rate of more than 620,000 a year, and 95% of the world's telephones, in more than 85 countries and territories, could be reached from any telephone in the United States. (L. A. Wi.)

Television.

United States.—Late in 1948, the Federal Communications commission (*q.v.*) instituted a "freeze" on applications for television stations in order to investigate the cochannel and adjacent channel interference problems and, if necessary, revise geographical allocations before further stations were actually placed in operation. It had been expected that the engineering studies involved could be made and the hearings completed so that the freeze could be lifted early in 1949; but the engineering work was not finished until the middle of the year and, in the meantime, other delaying factors arose. The inadequacy of the very-high-frequency channels to provide a nation-wide competitive television system became apparent, and consideration was given to the allocation of ultra-high-frequency channels to provide for additional stations. Certain proponents of colour television insisted that it had now been developed to the point where a satisfactory commercial television broadcasting service could be provided. Late in September a general television hearing was begun to consider the following important issues:

1. Consideration of colour television systems which would permit operation in a 6-mc. television channel and which would require no more than relatively minor modifications of existing receivers.
2. Reallocation of the 12 VHF television channels to reduce interference between stations.
3. Utilization of the band 475-890 mc. for television broadcasting service and the geographical allocation of channels within that band. (Included in this issue was the question of the allocation of the 470-500 mc. band for broad-band multichannel mobile radiotelephony.)
4. Allocation of specific channels to cities and communities on a nation-wide basis.

After the first few weeks of the hearing it became apparent that the colour television issue could not be settled quickly, and it appeared that the commission would not reach the general allocations phase of the hearing until 1950.

Colour Television.—Three specific colour television systems were proposed during the course of the hearing; a "field sequential" system in which the picture is scanned from top to bottom before a change from one primary colour to another occurs; a "line sequential" system which requires a change in colour for each scanning line; and a "dot sequential" system in which the colour is changed for each picture element or dot.

CBS sponsored its "field sequential" system with standards modified to permit operation in a 6-mc. band; the basic system, employing a colour filter disk, was the same as the one which the commission had declined to adopt in 1947. A new "dot sequential" system was proposed by RCA. Complete compatibility was claimed for this system in that it would permit black and white receivers to obtain black and white pictures from colour transmissions without receiver modification; and with high definition, permitting detail equivalent to monochrome to be transmitted in colour. The "line sequential" system was advocated by Color Television, Inc., of San Francisco, Calif. This system was also completely compatible in that black and white receivers would not have to be modified, and transmission of picture detail would be comparable to that provided by the black and white standards.

Television Receivers.—Television receiver production for 1949 was estimated at more than 2,500,000 units, a three-fold increase over 1948. The total value of these receivers was more than $700,000,000, based on an average sales price of $280. A total of 3,500,000 television picture tubes or kinescopes were produced.

Two definite trends in television receivers developed in 1949; larger pictures and lower prices. The percentage of receivers employing the 12½-in. and larger picture tubes was increasing at a rapid rate. Some manufacturers had already discontinued using 10-in. tubes. Plastic and metal television receiver cabinets were introduced in order to obtain lower instrument costs. During 1949 the price of a 10-in. television receiver was approximately one-half that of a comparable receiver produced in 1946.

TELEVISION IN THE UNITED STATES
AS OF JULY 1949

A number of television receiver manufacturers featured models with built-in antennas; others placed special emphasis on picture tubes having light absorbing material incorporated in the glass on which the fluorescent screen material was deposited. Improved picture contrast and greater freedom from undesired effects of room lighting were claimed for these tubes.

Networks.—At the end of 1949 more than 8,000 mi. of network facilities were in use interconnecting more than 50 television stations. In January the east coast and midwest television networks were interconnected by an east-west link through Pittsburgh, Pa. Additional network extensions were provided to Columbus, Cincinnati and Dayton in the Ohio valley; to Erie and Lancaster, Pa.; to Schenectady, Utica, Syracuse and Rochester in New York state; and to Providence and Wilmington on the east coast.

To provide a program service to stations not yet served by interconnecting network facilities, program originating stations relied upon films made by photographing programs as they were reproduced on the face of special kinescopes or picture tubes. These kinescope recordings were processed rapidly and sent to affiliated stations by the fastest means available.

Stations and Programs.—At the end of the year, 98 television stations were operating on a regular program basis, double the number on the air on Dec. 31, 1948.

During 1949 elaborate variety shows continued to hold first place in program preference, with the weekly program the "Texaco Star Theatre" starring Milton Berle sometimes accounting for as much as 75% of the total viewers. Outstanding sports events such as the world series baseball games, championship prizefights and the more important college football games were some of the feature television programs of the year.

The Truman presidential inaugural ceremonies televised on Jan. 20 were witnessed by more than 10,000,000 people, a total greater than the sum of all who saw presidential inaugurations from Washington to Roosevelt.

The advisability of continuing to televise professional sports events was being questioned by many sports promoters at the end of the year. The owners of professional football teams had banned the broadcasting of their games in the particular cities where they were being played, because they feared the telecasts would adversely affect the box office. This problem was also under consideration in intercollegiate circles.

Theatre Television.—Increased interest in theatre television was evident in 1949. Direct projection theatre television equipment was installed in theatres in Brooklyn and Boston. Experimental equipment was used to show the 1949 baseball world series to paying audiences in both theatres. (*See* also MOTION PICTURES.)

Television in Education.—During 1949 surgical operations were televised in colour for several medical conventions. Medical authorities who participated in these demonstrations were enthusiastic about the potentialities of colour television for teaching surgery and medical techniques. In New York city, 4,000 high school students witnessed a morning session of the United Nations.

(*See* also ADVERTISING.) (G. L. Bs.)

Europe.—During 1949 progress outside the U.S. and Great Britain was still primarily a matter of blueprints and optimistic statements intended to allay local impatience. Even in France the number of sets in operation at the end of the year was about one-tenth of the licences issued in Great Britain—20,000 to 200,000. No statistics of this kind were available for the U.S.S.R., the only other country in the world to operate a genuine public service; but it was learned that of the two standard models of receiving sets, one made in Moscow, the other in Leningrad, neither was sold except by special licence. The Moscow Television centre in the middle of the year was transmitting four programs a week, made up of newsreels, children's hour, plays and opera relayed from the state theatres, films and light concerts. Audiences were encouraged to listen in groups, in clubs and rest centres. Moscow operated on a standard of 625 lines and this showed signs of becoming a world standard, on paper at least, because at a conference of European radio organizations in Switzerland in the autumn, Belgium, Czechoslovakia, Denmark, Germany, Italy, the Netherlands and Switzerland all agreed that it was likely to serve their needs best. Australia and Argentina also settled on 625 lines. Adoption, however, was so far entirely theoretical; only four countries in the European group even embarked on closed circuit experiments and these for the most part consisted of geometrical patterns, not genuine programs. The European practitioners, Great Britain and France, on the other hand, agreed on a common temporary standard of 405 lines (which for France meant a slight reduction), and agreed to consider future co-operation at a higher level of scanning. The way was thus paved for a full exchange of programs when a cable or radio link was established between the two countries. This was only realistic after it became increasingly obvious that television was a highly expensive entertainment. By the end of 1949, for instance, Great Britain was spending more than £1,000,000 a year on less than 250,000 viewers. This inescapable financial fact made it unlikely that any other European country would start a public service for at least two years. To many observers it seemed unfortunate that the smaller countries were not prepared to align themselves with Great Britain and France, since by so doing they would not only have made television a practical proposition for themselves, but would have advanced the cause of European unity.

At the end of the year the B.B.C. opened at Sutton Coldfield, Warwickshire, the most powerful transmitting station in the world, with an aerial 750 ft. high, designed to serve the midlands but from its first tests it seemed likely to serve also much of the north. Before this, however, the B.B.C. had announced a national plan for bringing television to 80% of the population within five years. This involved the building of three more high-powered stations, in the north of England, in Scotland, and in the Bristol channel area, and five low-powered stations, working on the same frequency, for the northeast of England, the Highlands of Scotland, Northern Ireland and the west of England (2). Completion of the plan depended on the government's giving permission for the necessary capital expenditure, estimated at £10,000,000. The acquisition by the B.B.C. of the film studios at Shepherds Bush, London, from the J. Arthur Rank organization gave the hard-pressed program and technical staff at Alexandra palace hope of better and roomier conditions in 1950. New cameras were installed and a new system of recording direct from the screen was developed by B.B.C. engineers.

Tennessee.

A south central state, 16th to enter the union, Tennessee is called the "Volunteer state." Land area 41,961 sq.mi., water area 285 sq.mi. Population (1940): 2,915,841; rural 1,888,635, urban 1,027,206, rural farm 1,271,944, native white 2,395,586, Negro 508,736, foreign born 11,320, other races 199.

The U.S. bureau of the census estimated the state population in 1949 to be 3,234,000.

The state division of vital statistics estimated population of principal cities to be (1947): Nashville (capital), 177,216; Memphis, 321,796; Chattanooga, 134,228; and Knoxville, 115,769.

History.—The state commissioners in 1949, appointed by Gov. Gordon Browning, were: agriculture, Edward Jones; conservation, C. P. Swan; education, J. M. Smith; finance and taxation, Clarence Evans; highways and public works, E. W. Eggleston; institutions, Houston Brown; public welfare, J. O. McMahan; insurance and banking, M. O. Allen; labour, J. L. Case; public health, R. H. Hutcheson; safety, Sam Neal; employment security, E. K. Wiley. Railroad and public utility commissioners elected by the people were: Hammond Fowler, John Hammer and J. B. Avery. The constitutional officers were: James H. Cummings, secretary of state; W. N. Estes, state treasurer; Cedric Hunt, state comptroller.

The general assembly of 1949 provided for an election on the question of calling a limited constitutional convention. The voters rejected this proposal. The state legislature in 1949 abolished the payment of poll tax as a prerequisite to voting in primary elections for all state and national offices; and exempted women, veterans and the blind from the poll tax requirement for all elections. It was left to the option of the county executive committee of each party, each year, to decide whether poll tax receipts should be required of other males (between the ages of 21 and 50) for voting in their respective primary elections for county and city offices. The compact for regional education was approved. A state bond issue of $3,000,000 was authorized to assist in the erection of a University of Tennessee memorial research centre and hospital in the Knoxville area. A motor vehicle financial responsibility law was enacted.

Education.—Enrolment in elementary schools in 1948 was 518,910, an increase of 3.6% over 1947. High school enrolment was 109,520, a drop of 9.7%. Total net enrolment in 4,994 schools was 628,439. There were 4,637 county and 357 city schools, 3,994 white and 1,000 Negro. The total number of teachers was 21,968.

Social Insurance and Assistance, Public Welfare and Related Programs.—In Sept. 1949 the total amount of assistance was $2,982,706 to 72,290 cases; 62,253 old-age recipients received 64.2%, 54,634 dependent children 32.9% and 2,381 blind 2.9%. The increase in payments over Sept. 1948 was 31.1%.

In 1948–49 there were seven correctional institutions; expenditures were $1,791,514. Separate schools were maintained for the blind and the deaf, three state hospitals for the insane, a home for the feebleminded and an industrial school.

Communications.—Of the 67,388 mi. of public road in 1948, 7,563 mi. were state highways; expenditure for construction of state highways was $31,596,210. There were 3,491 mi. of railroad in Tennessee in 1948. As of June 1949 there were 70 civilian airports, of which 39 were commercial, 22 municipal, 5 CAA intermediate, and 4 private, and 2 seaplane bases. There were 558,600 telephones in Tennessee, 155,500 business and 403,100 residence. Water-borne commerce on the Tennessee river in 1948 amounted to 2,963,264 net tons; Cumberland river 1,351,956; Mississippi river 11,217,750 (1946); and 2,054,126 (1946) at Memphis.

Banking and Finance.—In June 1949 there were 72 national banks and 220 state banks; assets $1,376,914,000 for national and $566,369,705 for state banks; deposits $1.287,522,000 for national banks and $523,774,044 for state banks. Savings and loan associations numbered 38 with assets of $114,334,000. Federal associations constituted 35 of these with assets of $113.648,000.

State revenue collected for the fiscal year 1948–49 was $141,091,086. Federal aid amounted to $41,642,096, proceeds from bonds sold $24,900.000. Debt outstanding was $91,933,000, an increase of $14,000,000 during the year. Collections increased by $9.259.239 over 1948, expenditures by $23,339,401. Of total expenditures of $203,431,622, $44,200,000 was for education, highways $41,100,000, welfare $30,800.000 and distribution to cities and local governments $63,100,000 ($25,900,000 for education).

Agriculture.—There were 234,431 farms in 1945; 17,788,997 ac. in farms, and 5.843,567 ac. in harvested crops.

The gross value of agricultural production in 1948 was $653,778; cash farm income $508.468. Cash income from crops was $260,049,000; from livestock $242,806.000; government payments $5,613,000. The value of home consumption was $145,310,000. The forest area was 12,641,000 ac.

Manufacturing.—According to the 1947 census of manufacturing, 3.346 manufacturing plants employed 221,454 persons, wages and salaries being

Table I.—*Leading Agricultural Products of Tennessee*

Crop	1949	1948	Average, 1938-47
Corn, bu.	68,900,000	74,415,000	63,487,000

Miscellaneous	5,670,366	4,973,271
Total value	$70,051,000	$58,676,000

*Largely limestone and marble.

$473,211,000. Value added by manufacture was $957,539,000, led by chemical industries $162,578,000; food $132,489,000; and textiles $121,294,000.

Mineral Production.—The total value of mineral production in Tennessee for the year 1947 was $84,425,000, according to the U.S. bureau of mines. (C. E. A.)

Tennessee Valley Authority.

Traffic on the 630-mi. inland navigation channel provided by the TVA multiple-purpose system of dams continued to increase in 1949. An estimated 413,162,893 ton-mi. of freight was carried during the first 11 months of the year, 10% more than in the same period of the preceding year. The greatest increase was in iron and steel shipped to fabricators in the valley region, and gains were registered also in shipments of grain, automobiles and petroleum products. These gains more than made up for a decline in coal traffic, resulting from lessened need for operation of steam-electric plants because of good water conditions. Traffic on the river in all of 1948 was 427,850,000 ton-mi., 13 times as much as in 1933 when TVA was established.

While no major floods occurred, savings in damage were achieved both in the Tennessee valley and the lower Ohio basin by regulation of lesser floods. The integrated power system (including several hydro projects owned by the Aluminum Company of America) produced 15,750,000,000 kw.hr. in the fiscal year ended June 30, 1949. During 1949, the 145 municipal and co-operative systems which distribute TVA power passed the 1,000,000 mark in number of customers served. TVA's wholesale power revenues were $58,000,000 in the fiscal year, providing net operating revenues of $21,500,000, equal to a 5% return on the net average power investment. Revenues of the locally-owned distributing systems totalled nearly $71,000,000, and their combined net earnings totalled nearly $14,000,000. Average use per residential customer increased to 2,762 kw.hr. at 1.54 cents per kw.hr., compared with national averages of 1,625 kw.hr. and 2.98 cents per kw.hr. Rural service expanded rapidly; of 120,000 new customers connected during the fiscal year, 92,000 were rural, and of these about 75,000 were farms. At June 30, 1949, about 66% of farms in the TVA service area had electricity, compared with 3% in 1933.

Two reports by outside agencies answered claims that TVA power operations are subsidized. The Federal Power commission, in a report prepared with the assistance of the U.S. army engineers and at the request of a congressional committee, found that the principles used in TVA's allocation of multiple-purpose investment among flood control, navigation and power were "reasonable" and that the allocation itself was "reasonable." The conclusions were based on findings that estimated benefits of navigation and flood control would justify single-purpose investments for those purposes far exceeding the actual investments in the multiple-purpose system. Haskins and Sells, certified public accountants of New York city, in a "task force" report to the Hoover Commission on Organization of the Executive Branch of the Government, found that "the Authority (TVA) is presently earning more than sufficient revenues from power operations to repay the investment in power facilities with interest."

TVA commenced construction of the Johnsonville steam plant on the shores of Kentucky lake in west Tennessee. The plant would have a rated capacity of 337,500 kw. and would be integrated in operation with TVA's hydro and steam system which at June 30, 1949, had an installed capacity of 2,747,100 kw. Watauga dam, on the Watauga river in east Tennessee, was placed in operation, the 17th dam to be completed by TVA since 1933. The dam, an earth and rock fill structure, is 318 ft. high and 900 ft. long, providing useful storage of 627,000 ac.-ft. and having an installed generating capacity of 50,000 kw.

Nearly 400 persons visited TVA chemical plants for technical information concerning fertilizer research or related subjects in the fiscal year, while other firms and individuals obtained information by correspondence or published sources. A continuous vacuum crystallization process for producing ammonium nitrate was placed in operation, essentially eliminating the explosion hazard present in the two common methods of graining the material, which is useful both as a fertilizer and munitions ingredient. TVA produced 158,700 tons of concentrated superphosphate, 3,500 tons of calcium metaphosphate, 15,000 tons of fused tricalcium phosphate and 151,200 tons of ammonium nitrate fertilizer. About 7,500 test-demonstration farmers used TVA fertilizer materials during the year, and reports from state extension services continued to show the value of the materials in soil and water conserving types of agriculture. Reforestation progressed to the point where the 200,000,000th tree from TVA nurseries was planted on the grounds of Murray State Teachers college, Murray, Ky. Most of the planting had been done on private lands by the owners. About 290 forest management demonstrations, large and small, had been established.

Harry A. Curtis was confirmed by the senate Feb. 8 as member of the TVA board of directors to succeed H. A. Morgan, retired. Other directors were Gordon R. Clapp, chairman of the board, and James P. Pope. (*See* also DAMS; ELECTRICAL INDUSTRIES; PUBLIC UTILITIES.)

FILMS OF 1949.—*Kentucky Dam* (Tennessee Valley Authority). (K. R. K.)

Tennis.

The tennis spotlight in 1949 was focused on two outstanding players from California, Richard A. (Pancho) Gonzales of Los Angeles and Frederick R. (Ted) Schroeder, Jr., of La Crescenta. After Schroeder won the English title at Wimbledon in July, Gonzales defeated him three sets to two in the deciding round of the U.S. championship at Forest Hills, L.I., N.Y., on Labor day. This was Gonzales' second successive win of the U.S. singles crown. He later left the amateur ranks when he signed a contract to meet professional champion Jack Kramer in a series of indoor exhibition matches.

In the field for the U.S. championship were the leading players of the world, including Eric Sturgess, champion of South Africa and runner-up for the U.S. title in 1948; Jaroslav Drobny, former Czechoslovakian Davis cup star; Frank Sedgman, champion of Australia, and his teammates, John E. Bromwich and George Worthington; Giovanni Cucelli, Italy's Davis cup hero and his partner, Marcello del Bello; Felicisimo Ampon, champion of the Philippines; Robert Abdessalam of France; Naresh Kumar of India; and Ricardo Balbiers of Chile. The other leading U.S. players included the veterans William F. Talbert, Gardnar Mulloy, Frank A. Parker and the younger clan Arthur Larsen, Earl Cochell, Herbert Flam, E. Victor Seixas, Samuel Match, James Brink and Tony Trabert. During the championship at Forest Hills, Schroeder was awarded the William M. Johnston trophy for good sportsmanship.

Gonzales also won the U.S. clay court and U.S. indoor championships.

Parker, U.S. champion in 1944 and 1945, also played his last year as an amateur after having been ranked in the first ten for 17 yr. Parker won his second French title in Paris early in the season, a feat accomplished for the first time since that championship was opened to foreign players in 1925.

Schroeder's Wimbledon victory was scored on his first try for that English title. He overpowered his countryman Mulloy (whom he met in the first round), Sedgman, Sturgess and Drobny all in hard-fought five-set encounters. Gonzales and Parker captured the English doubles championship, defeating Schroeder and Mulloy in a straight-set final.

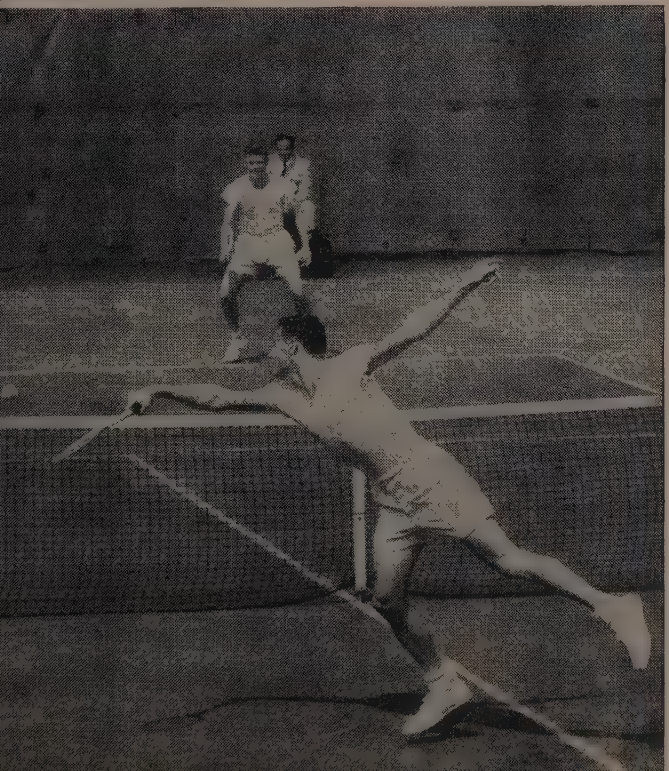
The U.S. was challenged by 28 nations for the Davis cup. Italy won the European zone competition and for the first time in history an Italian Davis cup team competed in the U.S. in an interzone final. Cucelli and Del Bello, however, unaccustomed to grass courts, were unequal to the task of holding off the experienced Australians, American zone winners, on the turf courts of the Westchester Country Club, Rye, N.Y., in August. Later that month in the challenge round at Forest Hills stadium, N.Y., the U.S. team turned back the Australians 4–1. It was the third successive victory for the U.S. since they won the cup from Australia in 1946. In the singles Gonzales and Schroeder each defeated Billy Sidwell and Sedgman while Bromwich and Sidwell downed Talbert and Mulloy in the doubles. This Australian pair also captured the U.S. doubles championship at the Longwood Cricket club, Brookline, Mass., where they beat their teammates, Sedgman and Worthington.

Women's tennis in 1949 again found U.S. players dominating the international picture. Mrs. Margaret Osborne du Pont won the French singles title and the doubles with A. Louise Brough. These two fought it out at Wimbledon, where Miss Brough won her second successive English singles championship, downing Mrs. du Pont, 10–8, 1–6, 10–8.

Doris Hart of Jacksonville, Fla., visited Australia and captured the Australian women's title. In the U.S. championship at Forest Hills, N.Y., she eliminated Miss Brough to reach the final, where she lost to Mrs. du Pont. For the eighth year in succession Mrs. du Pont and Miss Brough won the U.S. women's doubles championship.

England again was unsuccessful when it challenged the U.S. for the Wightman cup. The matches were played in the U.S. and the victory was the 17th for the U.S. women. (E. S. Br.)

TED SCHROEDER (foreground) of the U.S. and Frank Sedgman of Australia, during the third challenge round of the Davis cup finals at Forest Hills, N.Y., in Aug. 1949. Schroeder's victory was the third for the U.S. and gave it possession of the Davis cup



Texas. A west south central state of the United States, Texas was admitted to the union as the 28th state on Dec. 29, 1845. It is known as the Lone Star state from the single star in the flag of the Texas republic, 1836–45. Land area 263,644 sq.mi.; inland water 3,695 sq.mi.; total 267,339. Population (1940) 6,414,824. Estimated by U.S. bureau of the census, July 1, 1949, 7,532,000. Characteristics (1940): Urban, 2,911,389; rural, 3,503,435; white, 5,487,545; Negro, 924,391; other, 2,888; native, 6,179,296; foreign-born, 235,528. Capital: Austin, with 87,930 population in 1940 (121,000 estimated in 1949). Other cities: Houston, 384,514 in 1940 (500,000); Dallas, 294,734 (390,000); San Antonio, 253,854 (385,000); Fort Worth, 177,662 (268,000); El Paso, 96,810 (115,000); Galveston, 60,862 (75,000); Beaumont, 59,061 (81,000); Corpus Christi, 57,301 (120,000); Waco, 55,982 (78,000).

ALLAN SHIVERS, Democrat, who became acting governor of Texas on July 16, 1949, following the death of Gov. Beauford Jester

History.—The 51st legislature, Jan. 11 to July 6, 1949, the longest session on record, resulted in the passage of several hundred general statutes, important among which were reorganization of the state public school system, reform of state prison system, greatly increased support for the state hospital system and creation of 15 new state boards and commissions, including a state budget board and a state legislative council. Ten constitutional amendments were submitted. All were defeated except two, providing for rural fire prevention districts and changing district court procedure, in an election Nov. 8. Chief interest centred in a proposal for annual legislative sessions, instead of biennial, and to raise salaries. A similar proposal was defeated in 1947. The only other election, also on Nov. 8, was that to name members to the new state board of education.

The principal state officials for the biennium, 1949–1950, were: governor, Allan Shivers (succeeded Gov. Beauford H. Jester who died in office July 11, 1949); lieutenant governor (vacancy as of Jan. 1, 1950, Shivers being elevated to the governorship upon Jester's death); attorney-general, Price Daniel; comptroller of public accounts, Robert S. Calvert; treasurer, Jesse James; state commissioner of education (vacancy as of Jan. 1, 1950, pending appointment to newly created office); commissioner of agriculture, J. E. McDonald; commissioner of the general land office, Bascom Giles.

Education.—The state's public school system was reconstructed in 1949 by passage of the Gilmer-Aikin act, principal effect of which was to transfer administration of schools from local to state authorities. The former nine-member board of education appointed by the governor was abolished, also the elective state superintendent of public instruction. The new act set up a 21-member state board of education with 1 member elected from each congressional district. Succeeding the state superintendent was the state commissioner of education appointive by the new elective board.

Scholastic population (1949) 1,529,972; administrative and teaching personnel, 48,987; state expenditures for education, $165,864,240, including higher education; local support of common schools only, $72,-

000,000.

Social Insurance and Assistance, Public Welfare and Related Programs.—(As of Aug. 31, 1948) Old-age assistance rolls, 205,526 with average $31.51 monthly payments. Aid-to-dependent-children rolls, 42,518 children in 15,951 families, with average of $15.62 a child or $41.65 a family. Aid-to-blind rolls, 5,709 with average of $34.94. Total recipients of public assistance, 227,186.

Communications.—Total public road mileage in 1949 was 204,000; designated highway system, 30,146 mi., of which 29,003 were hard-surfaced; annual disbursements for highways in late years, $107,000,000, including federal aid; total motor vehicle registration, 2,425,476. Main-line railway mileage, 15,585; tons freight revenue, 163,222,751. Water commerce: foreign, 15,815,978 tons; ocean-going coastwise and intra-coastal canal, 107,720,214. The state is served by 11 interstate and international air lines. The number of airports on Jan. 1, 1949, was 624. Telephone exchanges 1,034, 1,511,602 instruments; telegraph offices, 1,828; radio stations: AM 171, FM 33, TV 6.

Banking and Finance.—National banks, June 30, 1949, 438; deposits, $4,765,149,395; resources, $5,093,512,827. State banks, 443; deposits, $1,051,879,475; resources, $1,128,643,567. Federal savings and loan associations, 84, with $294,518,385 of assets (June 30, 1949); state savings, and building and loan associations, 57, with $131,994,712 assets. State government receipts for fiscal year ended Aug. 31, 1949, $522,421,226; expenditures, $449,189,762. The large surplus was dissipated by appropriations for the 1949–50 fiscal year. The state government's bonded debt was $4,107,000, all of which was owned by the state's various permanent funds; total debt of all counties, cities, districts and other local subdivisions, $647,251,632.

Agriculture.—Total 1949 harvested acreage, 30,141,000; value of crops, $1,522,043,000. Notable was the cotton crop of 5,900,000 bales from 10,725,000 ac., second largest in the history of the state, representing a sharp upturn after several years of declining cotton production. Cash income from crops and livestock, 1949, was estimated at $2,300,000,000.

Table I.—*Leading Agricultural Products of Texas*

Crop	1949	1948	Average 1938–47
Cotton lint, bales	5,900,000	3,153,000	2,722,000
Cottonseed, tons	2,432,000	1,306,000	1,120,000
Wheat, bu.	102,848,000	59,104,000	53,944,000
Sorghum for grain, bu.	92,676,000	76,434,000	58,596,000
Corn, bu.	58,208,000	44,698,000	67,694,000
Rice, bu.	22,618,000	24,459,000	16,416,000
Sorghum for forage, tons	2,145,000	2,750,000	3,970,000
Peanuts, lb.	343,785,000	300,800,000	265,706,000
Hay, tons	1,366,000	1,311,000	1,423,000
Oats, bu.	34,020,000	14,240,000	27,370,000
Tomatoes, bu.	5,517,000	4,885,000	...
Sweet potatoes, bu.	5,775,000	3,250,000	5,229,000
Grapefruit, boxes	5,400,000	11,300,000	18,624,000
Onions, 50-lb. sacks	3,644,000	4,747,000	...
Oranges, boxes	1,550,000	3,400,000	3,618,000

Number and value of livestock on farms, Jan. 1, 1949 (U.S. department of agriculture): All cattle 8,235,000, valued at $848,205,000; milk cows only 1,283,000, valued at $173,205,000; hogs 1,701,000, valued at $46,437,000; sheep 6,628,000, valued at $85,393,000; goats 2,471,000, valued at $11,614,000; horses 387,000, valued at $15,480,000; mules 160,000, valued at $8,320,000; chickens 25,771,000, valued at $32,471,000; turkeys 770,000, valued at $5,544,000.

Manufacturing.—The 1947 census of Texas manufactures showed $1,727,464,000 of total value added to manufactured products as compared with $453,105,423 in the next preceding census of 1939. Wage earners had increased from 126,996 to 242,014; wages from $128,138,703 to $558,420,000.

Minerals.—Total production value in 1949 was $2,266,000,000 (preliminary estimate) as compared with $2,672,000,000 in 1948. The decline came primarily from official restrictions on petroleum production in 1949. Crude oil production, 1949, estimated at 738,475,000 bbl., valued at $1,956,959,000, as compared with 1948 production and value of 898,313,027 bbl. and $2,362,563,261. Natural gas production, 1949, estimated at 3,517,567,000,000 cu.ft., valued at $140,000,000, as compared with 1948 production and value of 3,298,483,000,000 cu.ft. and $128,540,830. (These estimates from Mid-Continent Oil and Gas association, Dallas). (S. McG.)

Table II.—*Principal Mineral Products of Texas*

Mineral	Production 1947	Production 1946	Value, 1947
Oil, bbl.	819,427,000	760,505,000	$1,577,028,000
Natural gasoline, thousand gal.	1,646,227	1,581,451	104,007,000
Natural gas, million cu. ft.	1,932,857	1,776,148	71,129,000
Sulphur, long tons	3,965,825	3,188,086	70,514,000
Carbon black, lb.	895,773,003	830,850,000	51,787,000
Liquefied petroleum gases, gal.	973,703,000	691,357,000	33,133,000
Cement, portland, bbl.	12,349,219	10,996,478	24,112,000
Sand and gravel, commercial tons	11,641,867	11,188,849	10,249,000

Textile Industry.

The United States textile industry experienced in 1949 its first decline in demand for its products during the postwar period. Consumption of the three major fibres, cotton, wool and synthetics, dropped by approximately 20% in 1949 as against 1948, and by about the same percentage in comparison with the average of the three previous years, 1946, 1947 and 1948.

This decline was not uniform among those three classes of fibres. Wool consumption in the United States suffered the greatest drop, about 30%; cotton was next with a decline of approximately 17%; and even the group of rayon and other synthetic fibres, which had experienced a steady march upward over the years, was consumed at a rate of about 13% less in 1949 than in 1948.

The over-all decline in demand for textile products in 1949 can be explained to some extent by the general recession in business activity in the country as a whole, particularly during the first part of the year. Another factor affecting textiles was the appearance on the market, in larger quantities, of other types of consumer goods which had been practically unavailable during World War II and scarce during the immediate postwar years.

As demand declined, prices dropped also, although not in proportion. Wholesale prices of textiles in the United States in 1949 were approximately 6% lower than they were in 1948. However, 1947 and 1948 were high-price years in textiles, reflecting the dropping of controls. Consequently, 1949 was still slightly above the average of the three previous years, 1946, 1947 and 1948, and some textile manufacturers anticipated further price declines.

The United States decline in both output and prices of textiles was regarded as not only a domestic situation but a part of what some experts in the international field regarded as an approaching crisis in world textiles. Currency restrictions and other problems of world trade added to the uncertainty created by the increased consumer resistance in the domestic market. (D. G. Wo.)

Great Britain.—Board of trade returns showed that in the first nine months of 1949, imports of raw wool into the United Kingdom totalled 623,000,000 lb., compared with 529,000,000 lb. for the same period in 1948. Re-exports amounted to about 103,000,000 lb., which was slightly lower than in 1948. In the same period of 1949 (Jan. to Sept.), exports of wool tops were 44,807,000 lb., compared with 44,095,000 lb. in 1948. Export of woollen and worsted yarns at 18,969,000 lb. was a considerable improvement over the 11,818,000 lb. in 1948. For the same period, exports of woollen and worsted tissues totalled almost 81,000,000 sq.yd., compared with nearly 77,000,000 sq.yd. in the same period of 1948. Shipments of blankets were higher than the 1948 figures, and exports of wool waste were 16,019,000 lb., compared with the 1948 figure of 8,260,000 lb. Carpet and rug exports declined slightly from the peak exporting level of 1948.

Production figures of cotton were encouraging. In the week ended Nov. 19 the total output of yarns was a postwar record of 20,750,000 lb., compared with 19,640,000 lb. for the same period in 1948. Total output for the 46 weeks ended Nov. 19 was 873,520,000 lb. According to the cotton board, the weaving sections reached their highest postwar level of output in the four weeks ended Oct. 29. The weekly average was 54,320,000 linear yd. for the month and production was 8% higher than in Oct. 1948. Production for the 43 weeks ended Oct. 29 was 2,121,050,000 linear yd.

The international textile machinery exhibition at Belle-Vue, Manchester, in October, was an important event. It was the first since 1938 and there was evidence to show that the industry was on the threshold of several radical and important individual developments. For the first time, in many cases, textile managers and executives were able to study and examine the latest postwar machines built in Great Britain, the U.S., France, Switzerland, Czechoslovakia, Belgium, Denmark and Italy.

Despite the difficult conditions of world markets, Northern

Ireland continued to export 75% of its linen production; and there was an extension of units spinning woollen yarns, manufacturing carpets and spinning and weaving rayon, etc.

British Commonwealth.—Wool shipments from Australia were higher than in 1948 and no sooner was the devaluation of sterling announced in mid-September than the market began to climb. Average-to-good fleece showed an average appreciation of 10%–12½%. The Australian textile industry steadily expanded and negotiations to establish the first units of a rayon-spinning industry were well advanced. It was intended to form a company with a nominal capital of £A10,000,000 to build factories for production of viscose and acetate rayon.

In India, the exports of cotton piece goods to Pakistan were much reduced but there was an increase in other markets. British East and West Africa absorbed increased quantities and there were smaller increases in Ceylon, Australia and Aden. Toward the end of the year Argentina placed very large contracts for hessian cloths.

The Canadian textile industry was busily engaged throughout the year and, in addition, imported increased quantities of British piece goods, chiefly woollens and worsteds.

Europe.—Textile production increased in most European countries, one of the most important features being the steady increase in western Germany. Belgium also showed signs of revival but production in general was actually less than the 1948 figures. Activity in the French cotton industry recovered and yarn production was at the 1948 level; cloth production was substantially greater. Yarn and cloth production in Italy increased slightly. Textile production in the Netherlands was about the prewar level but substantial quantities of textiles continued to be imported from the United Kingdom.

The textile industry in Czechoslovakia increased the output of yarn and cloth to a high level.

(*See* also Cotton; Rayon and Other Synthetic Fibres; Wool.) (A. Dr.)

Thailand

(Siam). A kingdom of southeastern Asia bounded by Burma to the west and northwest, by French Indo-China to the northeast and east and by Malaya to the south. Area: 198,272 sq.mi.; pop.: (1947 census) 17,256,825; (1948 est.) 17,666,000. Languages: Thai or Siamese *c.* 75%, Chinese *c.* 20%, Indian and Malayan languages also spoken. Religion: Buddhist 95%, Moslem 4%. Chief towns: Bangkok (cap., pop., 1947 est., 827,290); Chieng Mai (pop., 1937 census, 544,001); Khonkaen (473,475); Chieng Rai (443,476). Ruler: King Phumiphon Adundet; prime minister: Marshal Luang Pibul Songgram.

History.—The new constitution, prepared by a constituent assembly during 1948 and submitted to the legislature in Jan. 1949, was approved by the council of regency in March. In its general form the new constitution preserved the system of government by king, cabinet and bicameral parliament, the lower house being elected on a wide franchise and the upper house nominated by the crown. It also defined in detail the rights of the subject, prohibited members of the armed forces from joining political parties, affirmed the independence of the judiciary and defined the purposes of the state which included co-operation with other nations in maintaining international justice and world peace, preservation of the national traditions and maintenance of the principle of private enterprise. Following the promulgation of the constitution, the government announced on May 11 that the official name of the country in English would again be Thailand, instead of Siam, so reverting to the practice of the years 1939 to 1945.

General elections were held, and on the meeting of the legislature in June the cabinet was reshuffled, Marshal Pibul Songgram remaining prime minister. The cabinet secured a vote of confidence in the lower house in July.

No change of importance occurred in the composition of the cabinet till October, when the decision was taken not to maintain the official sterling rate at 40 bahts to the pound but to alter it to 35 bahts to the pound; this decision caused the resignation of the finance minister, Prince Viwat Jayanta, and Marshal Pibul then took charge of the finance portfolio.

On a number of occasions during the year rumours were in circulation of an attempted coup by the Free Thai party, the followers of the exiled statesman, Nai Pridi Panomyong. Suitable precautions were taken by the authorities and only one serious outbreak occurred. According to the official statement, on the night of Feb. 26 members of the Free Thai party attempted a revolution; they seized the royal palace and other important centres in Bangkok, including the broadcasting station from which they announced that Nai Direck Jayanama, a member of the Free Thai and a former ambassador in London (1947–48), had assumed office as prime minister. In the resultant disturbances, misunderstanding between naval and military personnel caused a clash between the two services which was not terminated for two days. The disorders were ultimately suppressed and a number of Free Thai leaders were arrested, four of whom were shot in an ambush while under police escort. Nai Direck later denied that he had had any connection with the attempted coup.

In the field of external relations, the prime minister made an important statement to the press in June, when he stated that Thailand would favour a security pact for southeast Asia on the lines of the North Atlantic treaty. In regard to the possibility of Communist agitation, Marshal Pibul stated that about 200 Chinese Communist agitators had been arrested by the police, and that the possibility of Communist disturbances among the 3,000,000 Chinese in the country could not be ruled out, though he was confident of the ability of the security forces to deal with them. He expressed similar views in a further statement to the press in September, saying that the country was determined to stop any Communist aggression but was short of equipment; in event of war, therefore, Thailand would welcome aid from the western powers. He again expressed approval of the idea of a regional security pact which should include not only the independent states of southeast Asia but also the non-Asiatic states which had interests in the region.

The trial of three men accused of complicity in the death of King Ananda Mahidol on June 9, 1946, continued throughout the year and had not reached its conclusion at the end of December. His successor, King Phumiphon Adundet, continued his studies in Switzerland throughout the year.

It was announced in September that the king and Princess Sirikit Kitiyakara, daughter of the Thai ambassador in London, were engaged to be married. (B. R. P.)

Education.—(1939) government schools 429, pupils 61,297, teachers 3,626; local public schools 10,768, pupils 1,325,891, teachers 32,208; municipal schools 304, pupils 58,592, teachers 1,644; private schools 1,308, pupils 121,965, teachers 5,596; universities 2. Illiteracy: 53%.

Finance.—Budget (in bahts): (1948–49) revenue 1,666,000,000, expenditure 1,848,000,000. Note circulation (Feb. 1948): 2,203,000,000 bahts. Monetary unit: baht or tical with an official exchange rate (Dec. 1949) of 12.5 bahts to the U.S. dollar.

Trade and Communications.—(1948) imports: 1,708,000,000 bahts; exports: 2,022,000,000 bahts. Roads (1946): 3,902 mi. Licensed motor vehicles (Dec. 1948): cars 4,866, commercial vehicles 2,403. Railways (1947–48) 2,034 mi. Shipping (1948): number of merchant vessels 20, total tonnage 11,320.

Agriculture and Fisheries.—Main crops (in metric tons): rice (1948) 5,250,000; maize (1948) 10,000; cotton (1948) 6,000; tobacco (1947) 8,000. Livestock: cattle (Dec. 1947) 3,555,000; buffaloes (July 1945) 3,981,000; pigs (July 1945) 2,014,000; horses (Dec. 1946) 171,000. Fisheries: estimated total catch (1948) 195,800 tons.

Industry.—Electricity (1948) 48,000,000 kw.hr. Raw materials (in metric tons): rubber (1948) 33,000; tin (1948) 4,308; tungsten concentrates (1947) 448.

Theatre. During the season of 1949 clouds gathered over the theatre in the U.S. The League of New York theatres, embracing the principal figures in the operation of the metropolitan playhouses and their subsequent road attractions, instituted an investigation by nonprejudiced analysts, headed by Edward L. Bernays, the purpose of which was to determine how the theatre might be lifted out of the decline into which it had unmistakably fallen, to give it back the nationwide prestige which it had once enjoyed and, finally and perhaps most important, to increase its attendance and box-office receipts.

Bernays, whose staff polled groups in nine selected cities, presented his opinion that the remedy was partly as follows: (1) a clear statement by the league on how in the future it would deal with the public; (2) a manual for producers to pool workable economic production techniques; (3) a clinic in promotion and advertising; (4) the training of theatre staffs on how to conduct themselves with the public, a matter hitherto sadly neglected; (5) a pledge committing the theatre to honest dealing in the practice of ticket distribution—in this connection may be noted the New York city authorities' intervention in the speculation in theatre tickets and the suspension of about 33 brokers' licences; and (6) the institution of a nationwide campaign to acquaint the country at large with the professional theatre.

It was further pointed out as an indication of the theatre's decline that, whereas in the 1928–29 Broadway season 224 plays and shows were produced, only 70 were put on in the 1948–49 season. The number of New York theatres, similarly, was 75 in 1929 and only 32 in 1949, not a single new theatre having been built in 22 yr. and some of those still remaining being leased to radio and television interests.

A further supplementary investigation conducted among 2,500 group leaders and 2,500 representative people in the upper- and middle-income brackets in 27 different cities confirmed the findings, which had originally been confined to the nine cities, and established that 62½% of the people interviewed in cities outside New York city spent less on the theatre during 1949 than on the motion pictures, that the high price of tickets was a factor in diverting patronage, and that the physical discomforts of the average legitimate theatre added materially to the discouragement of theatre attendance. Public opinion was thus operating against the theatre and immediate steps were urged to rectify the situation.

Little, aside from an attempted regulation of ticket sales, had been done toward improving matters when the year came to an end.

While the investigation saw fit to overlook it, the paucity of first-rate plays and shows unquestionably figured largely in the public neglect of the theatre. It also saw fit to overlook the fact that, when first-rate or even fair second-rate attractions were available, the public interest was as great as it had ever been, at times, indeed, even greater. A prime example was to be had in the case of *South Pacific*, the musical comedy by Richard Rodgers and Oscar Hammerstein II, which scored a success unmatched in the later records of the theatre. So eager was the public to see it that speculators often got as much as $50 for a $6.60 ticket, and even standing room was at a premium.

Other plays and shows that proved nothing was amiss with the theatre when attractions were really good were Arthur Miller's *Death of a Salesman*, the best dramatic play of the season; Sidney Kingsley's *Detective Story; Touch and Go*, a topical revue by Jean and Walter Kerr; and various others. Proof was also to be had even when plays were critically defective but had elements of popular appeal, as in Mae West's revival of *Diamond Lil;* James Allardice's farce, *At War with the Army;* the Irving Berlin-Robert E. Sherwood musical, *Miss Liberty;* the musicalized *Gentlemen Prefer Blondes;* the Lunts' vehicle, *I Know My Love*, adapted by S. N. Behrman from the French *Auprès de ma blonde;* the Maxwell Anderson-Kurt Weill musical drama, *Lost in the Stars*, fashioned from Alan Paton's novel of racial prejudice in South Africa, *Cry, the Beloved Country;* etc. And still added proof was to be had in the box-office intake of such held-over attractions, produced at the end of the previous season, as *Light up the Sky, The Silver Whistle, Anne of the Thousand Days, Lend an Ear, The Madwoman of Chaillot* and *Kiss Me, Kate*, not to mention the continued box-office life of veteran exhibits like *Mister Roberts, A Streetcar Named Desire, Goodbye, My Fancy, Born Yesterday* and *Where's Charley?*

Statistics of the Theatre in New York City

	1949	1948
Productions	84	102
Musical comedies	29	34
Plays	55	68
Premieres	46	63
Successful productions	14	21
Performers employed	1,821	2,156
Tickets sold	8,500,000	8,800,000
Approximate cost of production	$3,800,000	$5,250,000
Number of shows booked for other cities	72	84

Among the better-known native playwrights who appeared during the year were Clifford Odets with *The Big Knife*, a play about Hollywood and the moving pictures which was so bad that it drew ridicule not only from the critics but from lay theatregoers; the before-mentioned Sherwood, whose book for *Miss Liberty* was a disappointment to many; Garson Kanin with both *The Rat Race* and the defective *The Smile of the World*, which collapsed after only five performances; Philip Barry with a poor adaptation of a French play by Jean Pierre Aumont called *My Name Is Aquilon;* Samuel Spewack with a negligible comedy, *Two Blind Mice;* and Lillian Hellman with a static and monotonous adaptation of Emmanuel Roblés' French drama about Simon Bolivar and the liberation of Venezuela from Spanish domination, titled *Montserrat*.

Ezio Pinza's abandonment of the operatic for the musical-comedy stage in *South Pacific*, together with his great success in that medium was one of the year's notable features. Least notable was the production of a play called *Anybody Home*, by a novice named Robert Pyzel, which was laughed off the stage after a few performances and which established a low mark for U.S. dramaturgy.

Among the more impressive acting performances were those of A. E. Matthews in the English comedy *Yes, M'Lord*, known in England as *The Chiltern Hundreds;* Mildred Smith in *Forward the Heart;* Lilli Palmer in the revival of Bernard Shaw's *Caesar and Cleopatra* and in *My Name Is Aquilon;* Mildred Dunnock in *Death of a Salesman;* Ralph Bellamy in *Detective Story;* Pinza and Mary Martin in *South Pacific;* Lynn Fontanne in *I Know My Love;* Sir Cedric Hardwicke in *Caesar and Cleopatra;* and Katharine Cornell in a verbose and tiresome romantic historical drama by Kate O'Brien, *That Lady*.

Worthy of mention was the encouragement of theatre building by a projected modifying of the New York building code which had restricted the nature of buildings devoted to dramatic entertainment and prevented floors above them from being rented and used for other business purposes. The institution of the so-called Show-of-the-Month club, patterned after such successful ventures as the Book-of-the-Month club and the Literary Guild, was another feature of the season; and strides were made toward clarifying and extending the benefit buys for legitimate attractions.

Summing up, the dramatic year was very far from satisfactory in a critical direction, but it nevertheless now and again was not quite so ignoble as the wailers made it out to have been. (G. J. N.)

Canada.—The Dominion Drama festival was held in Toronto, Ont., in April with Lord Bessborough trophy honours going to the Hamilton Players' guild production of *John Loves Mary*. *Fortune My Foe*, by Robertson Davies, presented by the Ottawa Drama league won the Sir Barry Jackson trophy for the best Canadian-written play.

Professional theatre experienced uncertainty. Hugh Parker's 1948-founded Stage society of Ottawa went into bankruptcy, and out of its ruins Malcolm Morley created the Canadian Repertory company with plans to use profits to establish a civic theatre. The New Play society of Toronto undertook ten plays for the 1949–50 season, six of which were written by Canadians. Summer theatre appeared in Peterborough, Ont., when Canadian Michael Sadler presented a Canadian-British-American cast in a run of ten weeks. The drama department of the University of Saskatchewan sent a summer-theatre company on a successful tour of prairie rural districts. (C. Cy.)

EZIO PINZA AND MARY MARTIN in a scene from *South Pacific*, which won the New York Drama Critics Circle award as the best musical comedy of the 1948–49 season; music was by Richard Rodgers, lyrics by Oscar Hammerstein II, and book by Hammerstein and Joshua Logan

Great Britain.—An interesting tendency manifested itself during 1949 in the taste of the British playgoing public. This was a readiness to accept with enthusiasm certain plays in which the authors had set out not to tell a connected story, but to let their minds play about a static situation. Two such plays, James Bridie's *Daphne Laureola* and Christopher Fry's *The Lady's Not for Burning*, were among the great successes of the London season.

In *Daphne Laureola*, Bridie's description of his approach to the play was that he had certain things that he wanted to say and tried to keep his audience entertained while he said them. His method of doing so was to invent a magnificently eccentric character, a woman of outstanding quality but a dipsomaniac (beautifully played by Dame Edith Evans). He takes this lady to a restaurant in Soho, and there, having removed her inhibitions with a series of double brandies, he sets her talking at large, to the delight of her fellow-diners and of her auditors in the theatre.

Fry's *The Lady's Not for Burning* was less obscure than Bridie's, but even so was not so instantaneous a success. The importance of the play lay not in the action but in the things Fry had to say, and in the nicely balanced mixture of poetry and wit with which he said them.

T. S. Eliot's *The Cocktail Party* was staged at Edinburgh, Scot., in the first week of the third annual festival there. As a technical achievement this play aroused particular interest, for in it Eliot was held to have brought to a successful culmination the experiments toward a new dramatic verse form which he had been carrying on in his previous plays, *Murder in the Cathedral* and *Family Reunion*. There was remarked an increased facility in the use of verse which could lower itself to the level of ordinary colloquial chatter or rise to the requirements of high poetic emotion.

The central figure of *The Cocktail Party* is a mysterious stranger who, appearing uninvited in a London drawingroom, proves to have an uncanny knowledge concerning the private affairs of his host and hostess and their guests, and leaves an impression both on their minds and the minds of the audience that he is some being of a supernatural order.

Two importations from the U.S., Arthur Miller's *Death of a Salesman* and Tennessee Williams' *A Streetcar Named Desire*, were of special interest, for both had been hailed by critics in the U.S. as plays of outstanding merit, and both were received in England with a certain degree of reserve. Two less controversial U.S. plays which were produced early in the year and were still running when it ended were *The Heiress* and *Harvey*. The former, adapted by Ruth and Augustus Goetz from Henry James's novel *Washington Square* told a good story and told it well, and owed much to the acting of Peggy Ashcroft and Sir Ralph Richardson. The latter, Mary Chase's odd fantasy about a happy dipsomaniac, with Sid Field playing his first "straight" part in the lead, drew a delighted public.

Several established British dramatists added to their reputations during the year though neither J. B. Priestley with *Summer Day's Dream* nor Peter Ustinov with *The Man in the Raincoat* (produced at the Edinburgh festival) was quite at his best.

The Stratford Memorial theatre continued on its increasingly distinguished career and the Old Vic company, reinforced in the spring by the return of Sir Laurence Olivier, made a promising start under its new direction in the autumn. (W. A. Dn.)

Tibet. A country of central Asia, lying north and northeast of the Himalayas, Tibet is mainly a high tableland. Nominally a Chinese dependency, it is in practice independent; it is the only country in the world which is entirely under ecclesiastical control (except the Vatican City state). Area: *c.* 470,000 sq.mi. Pop. (1948 est.): 3,000,000; one-fifth of the male population are monks. Capital: Lhasa. Language: Tibetan. Religion: Buddhist. Ruler: formerly Lhamo Dhondup, the 14th dalai lama, born June 6, 1935 and enthroned in the Potala, or chief palace, on Feb. 13, 1940; regent: Yung Tseng Dala.

History.—The threat to Tibetan independence from Chinese Communism led the regent to make approaches to the U.S. in 1949. The good offices of a traveller from the United States were utilized for the purpose. Later the regent cabled for help. Communist leaders claimed the country as part of China and announced their intention to protect the Tibetans from what they described as the aggressive intentions of the U.S. and Great Britain and to free the people from reactionary feudalism.

The British trade mission was withdrawn after the partition of India. A British firm was to establish a 600-kw. hydroelectric plant to supply current to Lhasa. (W. Bn.)

Finance and Trade.—Monetary unit: sang with an exchange rate (1948) of about 3 sangs to the Indian rupee, but there are considerable fluctuations. Principal imports: cotton goods, woollen goods, grain, hardware, glass, sugar, biscuits, dried fruit and tobacco. Principal exports: wool, borax, salt, musk, horn and herbs.

Timber: *see* Forests; Lumber.

Timor: *see* Portuguese Colonial Empire.

Tin.

World production of tin increased by nearly a third in 1948, but was still more than a third under the 1941 high. Outputs of the major producing countries and the estimated world totals during recent years are shown in Table I, as reported by the U.S. bureau of mines.

Table I.—*World Production of Tin*

(In thousands of short tons)

	1942	1943	1944	1945	1946	1947	1948
Australia	3.3	3.0	2.9	2.6	2.4	2.7	2.1
Belgian Congo	18.1	19.6	19.4	19.1	15.8	16.7	15.5

Others	12.4	12.4	7.8	8.2	8.2	6	7
Total	133	154.5	113	101	99	127.1	167.3

The 1948 total was about on a par with 1939, and was ahead of consumption for the first time since 1943. World smelter capacity had been largely rehabilitated, and the improvement was reflected in imports of metal into the United States in 1948, which more than doubled over 1947.

United States.—The salient features of the tin industry in the United States are summarized in Table II, as reported by the U.S. bureau of mines.

Table II.—*Data of the Tin Industry in the United States*

(In thousands of short tons)

	1942	1943	1944	1945	1946	1947	1948
Imports, total	62.4	41.0	54.8	47.0	60.1	59.7	97.1
In concentrates	32.4	27.5	39.8	37.5	42.7	31.8	42.0

Tito

(Josip Brozovich or Broz) (1892–), Yugoslav prime minister, was born on May 25 at Kumrovec, Croatia. He served in the Austro-Hungarian army in World War I and in 1915 was captured by the Russians. A prisoner of war until 1917, he joined the Red army and fought with it against anticommunist Russian armies. Returning to Croatia after the war, he became a labour leader and Communist and a Communist party organizer. In 1937 he became secretary-general of the Yugoslav Communist party. After the Germans overran Yugoslavia in 1941, he organized a leftist guerrilla group, which effectively harried axis occupation forces in the country. In Nov. 1942, using the pseudonym of Tito, he organized the Yugoslav Anti-Fascist National Liberation council. In the first months of 1945 all Yugoslavia was liberated and on March 7, 1945, Tito became officially prime minister of Yugoslavia and commander in chief of its armed forces. On June 28, 1948, the Cominform published a statement denouncing Tito for following "an incorrect line in the basic questions of foreign and domestic policy," and particularly for carrying out "a hateful policy in relation to the U.S.S.R."

As the propaganda campaign of all Communist-controlled countries against Tito continued during 1949 to increase in violence, the Yugoslav leader made numerous public replies. On Jan. 21, addressing the congress of the Serbian Communist party in Belgrade, he complained against "the false propaganda directed against a Socialist country." On April 9, at the congress of the Yugoslav People's front in Belgrade, he called for resistance to the Cominform appeal for forcible removal of the existing leadership of Yugoslavia; and he announced that Yugoslavia would not hesitate to trade with the west on equal terms in order to obtain equipment vital for industrialization. In a speech to shopworkers at Belgrade on Sept. 12, he challenged the soviet theory of the exclusive revolutionary role of the soviet army and maintained that progressive ideas could never be propagated by bayonets. Widening the ideological rift between Yugoslavia and the U.S.S.R., he said at Stolice, Serbia, on Sept. 27, that all great powers must understand that they could not buy or sell the freedom of small nations. Later, addressing 600 Yugoslav generals and other officers at Belgrade, Tito proclaimed that the army was prepared to defend Yugoslavia until the last breath and regardless whence the attack came. (*See* also Yugoslavia.)

Tobacco.

The U.S. tobacco crop of 1949 was estimated at 1,990,129,000 lb., compared with 1,980,325,000 lb. in 1948, a ten-year average of 1,718,375,000 lb. and an all-time record crop in 1946 of 2,332,000,000 lb. Yields per acre were lower than the record high 1,274 lb. of 1948, but at 1,224 lb. were far above the 1,033 lb. average for 1938–47. The acreage harvested in 1949 of 1,626,000 was 4.5% more than the 1,554,000 ac. of 1948 and slightly less than the 1,654,000 ac. average of the decade.

Class I flue-cured types of tobacco, produced mainly in coastal plain areas south of Maryland and the chief tobacco entering into cigarettes and the export trade, were estimated at 1,112,168,000 lb. in 1949, 4% larger than the 1,089,584,000 lb. in the preceding year and 12% more than average for the previous decade. The harvested acreage of 936,400 ac. was 6% larger than the 883,800 ac. in 1948 but 4% less than the 1938–47 average. Yields per acre were only 1,188 lb., compared with 1,233 lb. in 1948 and an average of 1,011 lb. for 1938–47. North Carolina was the leading state. Exports of this type were 387,000,000 lb. in 1948–49, or 8% greater than the previous year. Thus, with a 5% larger domestic use, carry-over stocks on July 1, 1949, were slightly below the record of the previous year, but

U. S. Tobacco Production by Leading States

(In thousands of lbs.)

State	1949	1948	Average 1938–47	State	1949	1948	Average 1938–47
North Carolina.	745,120	756,684	685,066	Maryland . .	41,000	34,950	31,551
Kentucky . . .	445,775	466,853	368,552	Wisconsin . .	30,266	28,738	33,653
Tennessee. . .	148,512	148,275	119,098	Ohio	29,220	28,160	24,165
South Carolina.	147,630	131,560	117,124	Connecticut. .	25,464	25,116	22,555
Virginia . . .	137,262	143,790	128,170	Florida . . .	25,061	20,846	19,045
Georgia . . .	116,590	95,763	88,358	Indiana . . .	15,720	14,370	10,957
Pennsylvania .	57,190	61,275	48,934	Massachusetts.	12,624	12,017	9,423

total supply for the marketing year 1949–50 was a new record. The 1949 crop at early sales brought an average price of about 40 cents per pound, approximately 15% below 1948. The national quota for 1950, as announced, would mean acreage allotments about 1% larger than in 1949.

Class 2 fire-cured types, produced mostly in Kentucky and Tennessee, in 1949 yielded 71,150,000 lb., compared with 73,241,000 lb. in 1948 and 81,337,000 lb. average for the previous decade. Acreage, under quota, was still further reduced to 60,400, against a reduction to 62,600 ac. in 1948. In spite of excess moisture early in the season and rain damage prior to harvest, yields were high at 1,178 lb. per acre, whereas 1948 gave only 1,170 lb. and 1938–47 only 954 lb. Carry-over of 156,000,000 lb. was slightly smaller than in 1948, and the supplies, a considerable part of which were used in making snuff and chewing tobacco, were fully ample to meet domestic use and prospective exports.

The burley-type tobacco crop of 1949 amounted to 586,257,000 lb., compared with 602,902,000 lb. in 1948 and 445,005,000 lb. average 1938–47. Yields were less than the record 1,396 lb. of 1948, but at 1,305 lb. were far larger than the 1,048 lb. average for 1938–47. The harvested acreage of 449,200 was large compared with either the 432,000 of 1948 or the decade average of 420,230. Carry-over stocks on Oct. 1 were estimated at 965,200,000 lb., giving a record total supply about 7.5% above the previous year. It was estimated that the price would be somewhat lower than the average of 46 cents per pound received for the 1948 crop.

The southern Maryland tobacco (type 32) crop of 1949 totalled 41,000,000 lb., compared with 34,950,000 lb. in 1948 and 31,551,000 lb. average 1938–47. The per acre yield in 1949 was 820 lb., well above the 750 lb. of 1948 and the 765 lb. average of 1938–47. Carry-over stocks were about the same as in the previous year, but exports lagged. The 1949 sales of the 1948 crop gave an average price of 54.5 cents per pound, compared with a wartime peak of 57 cents.

The 1949 crop of dark air-cured type tobacco was 36,602,000 lb., 5% more than the 34,772,000 lb. of 1948 and well below the 39,207,000 lb. for the preceding decade. The per acre yield of 1,158 lb. was near record, comparable with 1,163 lb. in 1948 and an average for the decade of 999 lb.

Cigar types of tobacco in 1949 were produced in an amount of 142,752,000 lb., about 1% less than in 1948 but well above the 131,162,000 lb. average for the decade 1938–47.

The total U.S. cigarette output in 1949 was about 392,000,000,000, a new record, compared with 387,000,000,000 in 1948. Cigar consumption declined to about 5,600,000,000 in 1949, compared with 5,800,000,000 in 1948, with those below 8 cents in price increasingly emphasized. Cigarette exports in 1949 were at only about 84% of the record level of 25,179,000,000 attained in 1948.

The world's tobacco harvest during the year July 1949 through June 1950 was forecast at 7,100,000,000 lb., compared with a revised estimate of 1948–49 production of 7,300,000,000 lb. and the prewar average (1935–39) output of 6,597,000,000 lb. (*See* also AGRICULTURE.) (J. K. R.)

Tobago: *see* TRINIDAD AND TOBAGO.

Tobin, Maurice Joseph

(1901–), U.S. secretary of labour, was born in Roxbury, Mass., on May 22. He worked for the New England Telephone and Telegraph Co. for a number of years, served in the Massachusetts legislature, 1927–28, was mayor of Boston, 1937–44 and governor of Massachusetts, 1944–46. In 1948 Pres. Harry S. Truman appointed him secretary of labour.

In 1949 Tobin termed the Taft-Hartley labour law "a device to punish and hamstring unions," and demanded its repeal. He advocated raising unemployment benefits and declared that "a sound insurance system" to guarantee each retired person $100 a month should be enacted immediately. Tobin supported the steel workers' union in its strike against the steel companies, and also supported a new, anti-Communist C.I.O. electrical workers' union after national C.I.O. authorities had ousted the former electrical workers' union as being left-wing dominated.

Toronto.

In 1949 the population of the capital city of Ontario, Can., dropped to 673,104 (plus about 155,000 in surrounding suburbs). In the Jan. 1, 1949, elections 32% of the voters returned sitting aldermen and school trustees, including two Communists in each group, but voted down for the fourth time a bylaw proposing two-year instead of one-year terms. Preparing for the 1950 election, the city council readied bylaws to place the election date in December and to permit commercialized Sunday sport.

On Sept. 6, 1949, the Toronto transportation commission took the first steps toward the construction of a four-mile $30,000,000 subway to move 40,000 passengers per hour at 18 m.p.h. instead of 14,000 passengers 6 m.p.h. with streetcars. All engineering functions relating to traffic were transferred from several city hall departments and co-ordinated under the Toronto city planning board. After a review of traffic problems, 80 new signals were installed, all streets got new signs costing $250,000, and a survey was made of 67,000 motorists requiring daytime downtown parking as a step toward solving their problems. The master plan of the city planning board, which advocated express-ways and traffic tunnels to harbour islands, went before the city council on Sept. 12, but no decisions had been announced by Dec. 31. In 1948 building permits totalled $32,300,000 (about the same as 1947); civic expenditures ran to $48,736,267 (1947: $45,037,977). (C. Cy.)

Town and Regional Planning.

In 1949 some progress was made in realizing postwar plans in the cities and towns of Europe and the Americas. Studies for comprehensive plans of cities were published in Great Britain, the Netherlands, Belgium, Norway, Sweden, Poland and Italy. In many of the English plans provision was made for lower densities of population in the congested centres, and many reconstruction plans in the war-torn cities of Europe included neighbourhood units protected by green zones. In Latin America, revised plans were made for Lima, Peru, and Buenos Aires, Arg. In Canada, a committee was formed to promote the planned development of Ottawa, Ont., and a National Planning conference was held in October at Winnipeg, Man.

In the United States two national planning conferences were held: the National Citizens Conference on Community Planning, sponsored by the American Planning and Civic association, at Oklahoma City, Okla., March 27–30, 1949; and the National

Planning conference, sponsored by the American Society of Planning Officials, at Cleveland, O., Oct. 10–12, 1949.

Private building of houses and apartments continued to dominate construction. Postwar plans contained many projects for public buildings and works, but actual construction awaited easing of the acute housing shortage. A number of cities listed public works projects to be realized in five- and six-year improvement programs.

In Tennessee and Connecticut, state planning agencies stimulated planning for cities and towns. In Connecticut all communities were urged to prepare comprehensive plans, including land-use maps, before adopting zoning plans. In Tennessee, the state planning board fostered public school courses in planning.

On July 8, 1949, congress passed the National Housing act, authorizing an 810,000 housing-unit program to be built in the succeeding six years. The act also provided for local planning for housing projects to conform to the comprehensive plan and set up a program of slum clearance under which urban redevelopment plans were being submitted to the Housing and Home Finance agency.

The congestion of downtown streets in U.S. cities continued to be a major problem. Parking metres at the curb aided somewhat, and net proceeds in some cities were devoted to purchase of space for offstreet parking. In spite of increased facilities for parked automobiles, many drivers abandoned their cars for downtown trips, and this added to the load of public transit companies. A number of cities abandoned some or all street car tracks and substituted buses.

Most cities in the United States improved or enlarged their airports during the year; new and larger airports were planned to care for planes needing longer runways. Some cities made planning studies to locate airports in conformity with the comprehensive plan for the region.

A score of universities offering degrees in planning were listed in the July *Planning and Civic Comment*. There was a tendency for universities to include courses in regional and national as well as city and town planning.

The citizen movement to support planning continued to grow. In addition to many existing local organizations, the American Planning and Civic association published work sheets for about 50 local and regional planning associations. (*See* also HOUSING.)

Track and Field Sports.

Probably the outstanding occurrence in track and field sports in 1949 was the successful invasion of Europe by a team of U.S. athletes who had qualified for the trip by their performances in the National A.A.U. outdoor championships at Fresno, Calif. The U.S. squad competed in ten European countries, breaking record after record, and climaxed the season by conquering a combined force of Scandinavian stars, $238\frac{1}{2}$ to $224\frac{1}{2}$, in a three-day meet at Oslo, Nor.

Although numerous sectional, national and world marks tumbled during the year, comparatively few had been accepted as the year drew to a close.

Jim Fuchs, 220-lb. Yale senior, heaved the 16-lb. shot 58 ft. 4 $\frac{27}{64}$ in. to surpass a world record at Oslo. Fuchs won the Intercollegiate A.A.A.A., National Collegiate A.A. and National A.A.U. championships and lost in only two title meets—the National A.A.U. indoor and the Metropolitan senior.

Fortune Gordien fared equally well in the discus throw, showing utter disregard for records. His throw of 186 ft. 11 in. at Tavastehus, Fin., on Aug. 14 was recognized as a world mark by the International Amateur Athletic federation.

Mel Patton, Craig Dixon, Mal Whitfield, Don Gehrmann, Fred Wilt and Bob Mathias, all Olympians of some stature, starred again and Andy Stanfield, Charles Moore, Jr., and Dick Phillips stood out as newcomers.

Patton, the Southern California ace, was unbeaten in the sprints before quitting competition for a coaching job. He did not equal his record of 9.3 sec. which he set the previous year for the 100-yd. dash, but he produced a mark of 20.2 sec. for 220-yd. dash. Stanfield of Seton Hall won the National A.A.U. 100-m. and 200-m. titles, tying the A.A.U. records of 10.3 sec. and 20.4 sec. He also took the I.C.4-A indoor 60-yd. dash, the outdoor 100-yd. and 220-yd. dashes and starred abroad.

Dixon of the University of California at Los Angeles had a perfect outdoor hurdling season and defeated Harrison Dillard in the National A.A.U. high hurdles event. Dillard was defeated only once indoors, but was troubled by a back ailment during the outdoor drive. Whitfield of Ohio State had trouble on the boards, but settled down later to take the N.C.A.A. outdoor 880-yd. run, the National A.A.U. 800-m. run and register a double at Oslo. Gehrmann of Wisconsin outran Willy Slykhuis of the Netherlands in his only eastern start on the boards, win-

6,259—Smith, Oklahoma

ning the Wanamaker mile in 4 min. 9.5 sec. However, his best time outdoors, as he took the N.C.A.A. mile, was 4 min. 9.6 sec. Wilt came to the front as a distance ace, pressing the European stars who specialize in the longer contests. He scored a notable double in winning the National A.A.U. 5,000-m. and 10,000-m. honours, breaking the record for the longer race with a clocking of 31 min. 5.7 sec.

Mathias kept his A.A.U. decathlon championship and triumphed at Oslo. Moore was sensational in winning the N.C.A.A. 440-yd. run in 47 sec. and then taking the A.A.U. 400-m. hurdles in the national record time of 51.1 sec. Phillips of Brown university, Providence, R.I., hit 6 ft. 7 in. consistently in the high jump.

The invasion of five Europeans—Gaston Reiff of Belgium, Willy Slykhuis of the Netherlands, Marcel Hansenne of France and Eric Ahlden and Ingvar Bengtsson of Sweden—marked the U.S. indoor season. Four of them scored 12 victories in 16 races and Reiff won the National A.A.U. three-mile title.

The New York A.C. won National A.A.U. indoor honours and the Los Angeles A.C. was the top team outdoors. Southern California, with the aid of Patton's double in the outdoor sprints, won both N.C.A.A. championships and Michigan State took I.C.4-A crowns indoors and out.

Tuskegee institute of Alabama retained the women's National A.A.U. championship outdoors. Mrs. Nancy Phillips of the German-American A.C. of New York won both the high and broad jumps for scoring honours in the National A.A.U. indoor games as she paced her squad to the team laurels. (T. V. H.)

Trieste, The Free Territory of.

A small state at the northern end of the Adriatic sea, between Italy and Yugoslavia, demilitarized and neutral, whose integrity and independence were assured from Sept. 15, 1947, by the Security council of the United Nations. Total area: 293 sq.mi. Total pop. (June 1949 est.): 345,000. Military governors under provisional regime: zone A, British-U.S. (area, 96 sq.mi.; pop., 285,000), Maj. Gen. Terence S. Airey; zone B, Yugoslav (area, 197 sq.mi.; pop., 60,000), Col. Mirko Lenač. Mayor of the city of Trieste; Gianni Bartoli.

History.—During 1949 the problem of Trieste remained unsolved; the British, French and U.S. governments stood by their declaration of March 20, 1948, suggesting the return of the free territory to Italian sovereignty, and the soviet government refused to agree to a revision of the Italian peace treaty which it considered unwarranted. Although in Jan. 1948 the Security council of the U.N. had been unable to agree over the appointment of a governor for the free territory, on Feb. 17, 1949, Jacob A. Malik, the soviet representative, reopening the controversy, proposed that the council should nominate Hermann Flueckiger, a Swiss diplomat, one of the candidates who had been put forward a year before by the British government and rejected by Moscow. The soviet delegate renewed his proposal in March and again in May, when it was rejected by 9 votes to 2.

On June 12 the people of Trieste freely elected their municipal council for the first time for 27 years. The elections were quiet and orderly and the six Italian parties which favoured the restoration of Trieste to Italy received 63.7% of the total of 172,036 votes cast.

On July 3 the Belgrade government announced its decision to introduce Yugoslav currency in zone B (or Yugoslav-occupied) of the free territory. The yugo-lira, an occupation money introduced in Sept. 1947 which exchanged with the Italian lira (legal tender in Trieste) at the rate of one yugo-lira for two lire, was discontinued. The Yugoslav dinar was introduced instead with an exchange rate of one dinar for nine lire. (This Yugoslav reaction to the June elections seemed to be more than a monetary reform. A monetary union is practically an economic one and this could lead to political union). As the Yugoslav decision was technically a violation of the peace treaty (but so had been the creation of the yugo-lira in 1947), the Italian government protested to the Security council.

At the close of 1949, Trieste's economic recovery still awaited the end of the "cold war" and an active east-west trade.

Economy and Finance.—Budget (1948–49): revenue L. 12,800,000,000; ordinary expenditure L. 13,800,000,000; extraordinary expenditure L. 16,300,000,000; total deficit L. 17,300,000,000. During the year 1948–49 the ECA allocation to Trieste was $17,800,000. For the year 1949–50 the Allied military government asked for $12,600,000.

Bibliography.—European Recovery Program, *Trieste Country Study* (1949). (K. Sm.)

Trinidad and Tobago.

This British colony consists of two islands off the South American continent north of the Orinoco river delta. Area: 1,980 sq.mi. Pop. (1948 est.): 590,000. Governor, Major General Sir Hubert Rance.

History.—Details of a new constitution were announced in February 1949; although not yet promulgated, preparations for its introduction, including the appointment of a speaker, were made. It provided for a governor possessing restricted reserve powers and presiding over an executive council which also included three *ex-officio,* one nominated and five elected members, these last to be chosen by the legislative council from among their unofficial members and to be actively associated with the work of administration of departments of government. The legislative council, presided over by a speaker appointed by the governor from outside the council, was to consist of three *ex-officio,* 5 nominated and 18 elected members, the speaker having neither an original nor a casting vote.

Finance and Trade.—Currency: West Indian dollar with an exchange rate, Nov. 15, 1949, of 58.33 cents U.S. Budget (1949 est.): revenue $42,627,045; expenditure $41,554,367. Foreign trade (1948): imports $131,822,264; exports, domestic $127,105,384, re-exports $5,521,749. Principal exports: petroleum and sugar. Sugar crop for 1948–49 was estimated at 159,032 tons, an all-time record. (Jo. A. Hn.)

Truman, Harry S.

President Harry S. Truman underwent a metamorphosis in 1949 that surprised both friends and enemies. The erstwhile modest Missourian, who regretted publicly that circumstances had catapulted him into the White House, and whose defeat in the 1948 election was generally regarded as a certainty, stepped forth as a confident, determined and aggressive leader of his party and the nation. Nor did he shrink from asserting himself as a spokesman and director of world affairs.

The new Truman appeared for the first time when he delivered his inaugural address on Jan. 20. He scrapped the famous Roosevelt slogan of the New Deal, substituting for it his own Fair Deal. In this address, in other speeches and in subsequent messages to congress, his Fair Deal demands were: repeal of the Taft-Hartley act and enactment of the Brannan farm plan; compulsory national health insurance; civil rights legislation; extension of social security; federal aid to education and health; stronger antitrust laws; greater development of public power; rent control; and housing for middle- and low-income groups.

"VICTORY PARADE," a cartoon by Justus, published in 1949 in the *Minneapolis Star*

Combating inflation, Truman emphasized, was the nation's principal problem. To this end he demanded new taxes totalling $4,000,000,000. He also asked for an eight-point anti-inflation program giving the government the right to control the supply of goods and credit and to build industrial plants, if necessary, to overcome commodity shortages. As prices fell and production rose during the year, he virtually abandoned these requests.

In the field of foreign affairs he urged continued support of the United Nations, the European Recovery program and the North Atlantic treaty. He advanced a new scheme for world co-operation with a proposal for improvement of underdeveloped areas through public and private investment overseas.

Congress refused to pass the greater part of his domestic program because of a hostile combination of Republicans and conservative Democrats, the latter mostly from the South. Nevertheless, the legislative rebuff did not discourage the president. Addressing a Jefferson-Jackson day dinner on Feb. 24, he said that "all we have on our side are the people." He declared that the party "was never more united or stronger, or more dedicated to the people's welfare." He predicted a Fair Deal victory in 1950 and 1952.

On April 12, the fourth anniversary of former President Franklin D. Roosevelt's death, Truman made one of his several appearances on Capitol Hill. Speaking from near his old seat in the senate, he said he had tried to do his best for the people and hoped he had not failed. Despite bitter criticism of his Fair Deal policies, Republicans and Democrats alike showed their personal friendliness for him at a luncheon given by J. Harold McGrath, senator from Rhode Island and Democratic national chairman.

Truman maintained keen interest in party politics. He attended numerous partisan dinners and receptions at Washington, D.C., and at Kansas City, Mo., usually making a formal address or an impromptu "pep talk." He refused to comment, however, on accompanying speculation that he might seek re-election. After the 1948 contest he had said he would not run again.

On Labor day Truman delivered two rousing campaign speeches, to factory workers at Pittsburgh, Pa., and to a farm audience at Des Moines, Ia. Recalling how effectively they had worked to elect him, he urged the two groups to organize a permanent political alliance. At Pittsburgh he said that his philosophy of politics and government was based on the sermon on the mount. Assailing his opponents as "selfish interests and standpatters," he said: "They're still doing all they can to slow up our progress, but they're not able to stop us."

Addressing 400,000 people at the Minnesota state fair in St. Paul in early November, he declared that he expected congress to enact most of his Fair Deal program at the 1950 session. Referring to the opposition's derogatory characterization of his theories as foreshadowing a "welfare state," he said that he appreciated the description and welcomed the challenge. He regarded the results of scattered off-year elections on November 8, which were favourable to the Democrats, as an endorsement of his record.

The one surviving member of the Roosevelt cabinet left early in 1949 when James V. Forrestal resigned as secretary of national defense, to be replaced by Louis A. Johnson of West Virginia. Others to resign during 1949 were Gen. George C. Marshall as secretary of state, Julius A. Krug as secretary of the interior and Tom Clark as attorney general to accept an appointment to the supreme court. In their places Truman named, respectively, Dean Acheson of Maryland, Oscar Chapman of Colorado and Senator McGrath of Rhode Island. When McGrath resigned as national chairman, William M. Boyle, Jr., former Kansas City policeman, succeeded him. (*See* also UNITED STATES.)

(R. TU.)

Trust Territories.

Under this heading are grouped former German colonies in Africa and Australasia which became League of Nations mandates after World War I and United Nations trusteeships after World War II. Their total area is approximately 1,033,297 sq.mi. and the total population 16,142,400. Certain esential information on the respective territories is given in the table.

History.—Developments which might prove to be of great moment took place in the trusteeship system of the United Nations during 1949. A continual study of the whole system was maintained so that it became possible to obtain clearer indications of the direction in which the experiment was moving.

All the trust territories sent in their annual reports—including, for the first time, the Pacific islands (also a strategic area) which was administered by the U.S.A. The Trusteeship council examined the reports at length, bringing into view the political, social, economic and educational development of the peoples during this period, and adopted resolutions thereon. It noted an increasing tendency to take advantage of the right of petition, which had been stimulated by the council's mission to east Africa in 1948.

Broadly speaking, majorities of the council approved of the progress made, particularly in the social and economic fields in spite of difficulties of climate, ethnology and finance. But there was considerable criticism, some of it constructive and helpful, some marked by little sense of proportion. The latter tendency was met with on a larger scale at the fourth assembly in New York, resolving itself into an increasing conflict between the powers of the administrations on the spot and the claims of those who, to a large or small degree, were opposed to the existing colonial system.

The Trusteeship council further undertook two far-reaching studies, the course and length of which were to depend on future developments: first, of the effect of administrative unions, such as that between Tanganyika and Kenya and Uganda, on the status and progress of trust territories; second, of the implications of expanding facilities for higher education in these areas. The reports of the council's mission to east Africa—Tanganyika and Ruanda-Urundi in 1948—were closely examined and their conclusions broadly adopted with a stress on the increasing need of speed. A further mission started for west Africa—the two Togoland and Cameroons trust territories—at the close of the year. A third was to visit the Pacific islands (with due regard to their being a strategic area) early in 1950.

When the fourth assembly met, the trusteeship issue was expanded to include colonial government in general and became larger in international discussion than any other subject except the determined and hardening difficulties between the U.S.S.R. and the western powers.

A number of resolutions were adopted. The special committee on information from nonself-governing colonies was given larger powers and prolonged for a further three years. Hitherto, in accordance with article 73 (e), Great Britain and other administering powers had forwarded to the secretary general of the United Nations, for information purposes, statistical and technical information on economic, social and educational conditions in the areas for which they alone were responsible. The act was voluntary and excluded political information. The assembly now asked these colonies to supply information on political and constitutional developments and to appoint a committee with powers of roving inquiry. Great Britain and other administering powers objected on the ground that the new proposals went beyond the charter and tended to assert the principle of international supervision over all colonies.

Enlargement of the powers of the Trusteeship council also came from another quarter, being part of the program finally adopted by the general assembly for the solution of the postwar

Trustee and Mandated Territories

*Controversial status.

problem of the former Italian colonies. Libya, for example, was to be constituted as a sovereign state by Jan. 1952; and to assist the inhabitants in the transition, help them to make their own constitution and administer the territory in the interval, a U.N. high commissioner was to be appointed, with a council of ten, who was to report to the next assembly. Next, Somaliland was to become a sovereign state ten years after the approval of a trusteeship agreement by the Trusteeship council and the general assembly, with Italy as administering authority, aided by a council of three. As regards Eritrea, a U.N. commission of five was to try to find out the best means to promote the wishes and the welfare of the inhabitants and to report to the fifth assembly.

Thus, there appeared to be two converging movements in the development of the trusteeship system, one tending to enlarge the power of the U.N. to the point of taking actual part in the process of administration in trust territories and the other to extend methods of internationalization to all nonself-governing territories. By the charter the proper role of the U.N. was to watch, criticize, admonish if need be and generally supervise territories administered under trust, but not to take any part in the actual process of administration.

Finally, at the close of the session a majority of the nations in the U.N. fourth general assembly gave further evidence of the increasing pressure which might be brought to bear on colonial powers. This was especially clear in their attitude toward the Union of South Africa's refusal voluntarily to transfer South-West Africa, which they persisted was held under a mandate, to a trust territory under the U.N. Three measures were taken. A resolution was adopted calling on South Africa to resume the submission to the assembly of annual reports on South-West Africa. What might become a precedent was created by the hearing given by the assembly to the Rev. Michael Scott on behalf of the Herero tribe, inside a former mandated area. Lastly, the International Court of Justice at The Hague, Neth., was asked for an opinion on three questions: What are the international obligations of the South African government in this former mandated area? Has the South African government the right to modify the international status of South-West Africa (a problem hotly debated under the League of Nations), and if not, who has the right? Is South-West Africa subject to the provisions of chapter XII of the charter? (*See* also INTERNATIONAL LAW; ITALIAN COLONIAL EMPIRE; UNITED NATIONS.)

FILMS OF 1949.—*Pacific Island* (International Film Foundation, Inc.).

(M. FE.; X.)

Tuberculosis.

Diagnosis.—Although the tuberculin test remained the only practical method of diagnosing tuberculosis early in its development, P. Courmont (Switzerland) stated that he was able to diagnose before tissues became sensitive to tuberculin by serum agglutination.

E. Friedman (Boston) found that antihistamine medication had no effect on the tuberculin reaction. W. W. Jones *et al.* (Denver) confirmed the fact that repeated testing with tuberculin does not cause people to become reactors, nor does it accentuate or suppress sensitivity already present.

Charlotte Silverman reported on mass radiography of 48,175 apparently healthy persons in Baltimore. The number of persons (662) classified as having definite or suspected tuberculosis by miniature films, decreased through successive steps of the examination. Reinspection by large chest films for which 86% returned reduced the number from 662 to 292 as having "definite X-ray evidence" of tuberculosis, and of these only 125 were thought to have clinical disease. Further processing reduced the number to 89 which the health department successfully followed for a year or more, of whom only 32 were found to have unquestioned clinical activity.

Limitations of mass chest X-ray surveys observed in 1949 were: (1) unsatisfactory response of the people (rarely more than 75% to 80% of those eligible); (2) persons with clear films may develop tuberculosis within weeks or months. W. Roemmich (Minneapolis) reported 23 bacteriologically diagnosed cases of pulmonary tuberculosis which were found within a year after survey X-ray films of their chests were clear.

Prevalence.—In Brazil the mortality rate was 246 per 100,000 population. A. A. Dufourt stated that there had been a great reduction in death rate from tuberculosis in France since 1900, but there were long waiting lists for sanitorium beds. In Greece, the rate was approximately 250 per 100,000 and there were fewer than 5,000 sanatorium beds. G. Hensel stated that 80% of the children leaving school in Germany reacted to tuberculin, against 30% to 40% before World War II.

B. Mann stated that in India 500,000 persons were dying annually from tuberculosis. G. R. Kokatnur estimated the number of active cases at 2,000,000; sanatorium beds were available for approximately 1%. In Turkey, the mortality rate was 267 per 100,000; free government sanatoriums and hospitals had a patient waiting list of about 3,000.

The 1948 mortality rate from tuberculosis in the United States was slightly less than 30 per 100,000 population. There was evidence suggesting that it was in the vicinity of 27 in 1949—(total 48,000)—lowest of any nation in the world with the possible exception of Australia. Approximately 103,819 beds were available. A. Reifel (Detroit) pointed out that the mortality from tuberculosis among Indians is five times that of the general population.

Treatment.—T. J. Kinsella and associates (Minnesota) reported the results of thoracoplasty done on 613 tuberculous patients between 1922 and 1943. Five to 20 years after operation, 66.8% were alive and 27.57% ultimately died from tuberculosis or its complications. Since 1931, the post-operative mortality (8 weeks) had been 3% per patient and 1.16% per operation. In 88.1% of the patients whose sputum contained tubercle bacilli prior to surgery, the organisms subsequently were not found.

By a surgical procedure known as decortication, J. A. Weinberg, and associates, (California) expanded lungs which had been collapsed by artificial pneumothorax and were otherwise unexpandable. G. W. Wright (Saranac Lake, N.Y.) and J. G. Gordan (Ray Brook, N.Y.) found that some such lungs do not function normally even though they are well expanded.

J. H. Grindlay (Minnesota) removed one lung from each of 21 dogs and in each case replaced the lung with a single unit prosthesis consisting of a roughly lung-shaped bag of polythene filled with fibre glass. This experimental work gave promise of leading to the development of a suitable prosthesis to replace the large undesirable spaces which result from removal of diseased lobes or lungs in humans.

S. A. Waksman (New Brunswick, N.J.) reported a new antibiotic, neomycin, to be more active than other antibiotics against both pathogenic and saprophytic microbacteria. It was active against both streptomycin-sensitive and resistant microbacteria; moreover, it did not allow rapid development of resistance among the organisms as did streptomycin.

One of the thiosemicarbazonens designated as T.B.1/698, announced by G. Domagk in 1946, was reported by F. Knüchel, *et al.*, and J. Hartung (Germany) as having a beneficial effect on tuberculous lesions.

The effects of streptomycin on tuberculosis had been carefully investigated by the United States Veterans' administration in co-operation with the army and navy for three years, and its usefulness and limitations were fairly well delineated. In 1949 these studies were extended by examining the effects of dihydrostreptomycin and para-aminosalicylic acid. This gigantic study included the administration of these new drugs to 7,000 tuberculous veterans. Streptomycin conferences of physicians in the various veterans' hospitals were held regularly.

No drug was found which would destroy tubercle bacilli in human and animal tissues. However, para-aminosalicylic acid and the antibiotics—streptomycin and dihydrostreptomycin—have a bacteriostatic effect on these organisms. Thus they suppress the disease temporarily, especially in acquired lesions. The problem of tubercle bacilli becoming resistant to streptomycin was partially solved by alternating this drug with para-aminosalicylic acid. C. W. Tempel (Denver, Colo.) employed an intermittent dosage schedule by which tubercle bacilli acquired resistance to streptomycin much later than when the drug was administered daily.

Prevention.—Although no new substantial evidence accrued concerning value of methods used with the hope of providing immunity to tuberculosis, enthusiasm ran high in some parts of the world for the use of BCG (Bacillus-Calmette Guérin) and the vole tubercle bacillus vaccine. Headed largely by Danish workers through the World Health organization, governments of nations were solicited to sanction prophylactic vaccinations against tuberculosis with BCG of 15,000,000 children and young adults, mostly in Europe and Asia.

R. J. Dubos (New York city) in discussing the immunological aspects of BCG vaccinations stated that the development of a tuberculin reaction was being universally used as a criterion that the vaccine had "taken" but unfortunately the relation of tuberculin allergy to immunity remained one of the most obscure aspects of the pathogenesis of tuberculosis. He pointed out that the possibility that under certain conditions, injection of BCG might bring about a state of allergy without inducing immunity. E. M. Medlar (Sunmount, N.Y.) called attention to attempts to vaccinate cattle with BCG which were without beneficial effect. He stated that the program of mass vaccination with BCG did not touch the major source of tuberculosis, and that it appeared illogical to anticipate that artificial vaccination could succeed when natural vaccination has failed.

Domestic Animals.—In the fiscal year ended June 30, 1949, a total of 8,737,501 tuberculin tests were administered to cattle by the U.S. bureau of animal industry, disclosing 17,007 (0.19%) reactors. Of the 13,168,967 slaughtered, only 166 (0.0012%) of the carcasses had to be sterilized. Tuberculosis among cattle had been eradicated from large areas of the United States.

In Queensland, Austr., J. C. J. Maunder said the incidence of tuberculosis in dairy herds had been reduced from 15.8% to 0.92% over a period of four years by means of the single intradermal tuberculin test.

In England a bill to insure greater freedom of children's milk from the dangers of tuberculosis passed its second reading in the house of commons. Dr. Edith Summerskill said that 1,500 deaths had occurred each year from milk containing tubercle bacilli and many more thousands were crippled. G. S. Wilson stated that in the rural areas, the percentage of children infected was ten times greater because more milk was consumed there than in London. The number of attested herds had been doubled since 1944 and about 16% of the cows of England belonged to such herds.

Avian tuberculosis continued as a serious economic problem in several U.S. midwestern states.

Organizations.—The World Health organization established an expert committee on tuberculosis and a tuberculosis section. The second assembly was held in June 1949. All countries were invited to submit their requests for tuberculosis work with special reference to demonstrations in X-ray work, tuberculin testing, BCG, special forms of therapy and fellowships.

STUDENT NURSES at Albany hospital, N.Y., being vaccinated with BCG, a vaccine believed to build up immunity to tuberculosis in persons not already infected. First large-scale testing of BCG in the U.S. was carried out in 1949

Virginia Cameron reported that during 1947–48 nearly $7,000,000 was spent on research on tuberculosis in the United States. More than $4,000,000 was for studies on chemotherapy by various organizations. The medical research program of the National Tuberculosis association had been in operation for 27 years and investigators receiving grants had published more than 1,000 articles. Approximately 24 separate investigations in universities and research institutions were supported in 1949. In May the board of directors voted that beginning in 1950 1% of the gross income from seal sales would be allocated to the National Tuberculosis association research program. On the basis of the 1948 income from seals ($20,153,476.79) this would amount to approximately $200,000 annually. Tunnels. Construction of tunnels for sewer, water supply, drainage, railroad and highway projects throughout the world was unusually active in 1949.

In the United States the twin-traffic tunnel between the Battery in Manhattan (New York city) and Brooklyn, N.Y., 1.2 mi. long, was expected to be completed and opened to traffic in 1950. At Pittsburgh, Pa., the twin-tube Squirrel hill traffic tunnels, 4,200 ft. long, were holed through, and were being lined with expectation of completion in 1950.

The Union Pacific railroad opened up its 6,700-ft. Aspen tunnel in Wyoming, eliminating the last single-track bottleneck on the main line between Omaha, Neb., and Ogden, Utah. In West Virginia the Norfolk and Western railroad completed two double-track tunnels, 7,000 ft. long, the largest in cross-section ever driven for railroad traffic.

On New York city's Delaware river water-supply system, the 6-mi. Neversink tunnel was approximately half finished, and the

25-mi. Downsville tunnel was begun; these bores when finished would convey water from the Delaware to the Hudson watershed to relieve the city's critical water shortage. In Baltimore, Md., the 7-mi. Montebello-Liberty road water tunnel was completed, and the 10-mi. Liberty road-Patapsco water tunnel was under construction. Boston, Mass., holed through its 5.5-mi. city tunnel; concrete lining was to be completed in 1950. Cleveland, O., finished a 1½-mi. intake tunnel, and Cincinnati, O., reported progress on its new small-bore water tunnel. The U.S. bureau of reclamation opened bids in Dec. 1949 for the first section of the 6½-mi. Tecolote tunnel near Santa Barbara, Calif.

The Pacific Gas and Electric company continued to make progress on its Feather river hydroelectric developments in California; two tunnels, one 26 ft. in diameter and 3.9 mi. long, the other 25 ft. in diameter and 6.6 mi. long, were to be completed in 1950. Los Angeles, Calif., started work on three long (5.1, 2.1 and 2.2 mi.) 10-ft. tunnels for new hydroelectric plants in its Owens valley water development.

In Latin America the Puerto Rico water resources authority was extending the Caonillas hydroelectric project by diverting three rivers, the upper Arecibo, Pellejas and Vivi, through four successive 7-ft. tunnels, 1.6, 2.0, 0.9 and 0.6 mi. long, respectively, into the Caonillas reservoir; all were started in 1949. In Chile the quarter-mile Angostura two-lane highway tunnel on the Pan-American highway south of Santiago was completed in August.

Lerma tunnel, 10-mi. bore and longest in Mexico, was holed through in 1949 and concrete lining was to be completed in 1950 to alleviate Mexico city's water shortage. In Brazil two large hydroelectric tunnels were being built by the Brazilian Traction, Light and Power company for its Barro do Pirai project in the state of Rio de Janeiro; they were the Santa Cecilia tunnel, 2 mi. long, and the Vigaria tunnel, ½ mi. long. An odd hydroelectric tunnel, 8 mi. long, was being driven for Empresas Electricas Asociadas e Hidrandina, inland from Lima, Peru. It was to be about 10 ft. in diameter for the first 6 mi., and 18 ft. in diameter for the last 2 mi., the larger size to be used for off-peak water storage to take care of peak electric loads.

There were numerous tunnel projects under way in Europe during 1949. In Italy 13 tunnels on 8 hydroelectric projects were under construction, the longest of these being the Piave di Cavore-Vaiont tunnel, 15 ft. in diameter and 11.7 mi. in length. The Acquedotto Romano del Peschiera water-supply project, under construction in 1949, included several tunnels, the longest being 49 mi.

In Germany two tunnels totalling 4.3 mi. were completed in Oct. 1949 on the Rissbach hydroelectric project in the Bavarian alps.

In England the British railways were driving the new Woodhead double-track tunnel between Manchester and Sheffield. The 11-ft. Bowland Forest tunnel, 10 mi. long, was under construction near Manchester as part of the city's new Haweswater water-supply line. Eleven hydroelectric tunnels were under construction in Switzerland. The only major tunnel under way in France during 1949 was the four-lane Croix-Rouse highway tunnel at Lyon, 39½ ft. in diameter and 1¼ mi. long. (H. W. RN.)

Turbojets and Turboprops: *see* JET PROPULSION.

Turkey.

A republic in the southeastern Balkans and Asia Minor, Turkey is bounded on the west by the Aegean sea, on the northwest by Greece and Bulgaria, on the north by the Black sea, on the northeast by the U.S.S.R., on the east by Iran and on the south by Iraq, Syria and the Mediterranean. Area: 296,185 sq.mi. (including 9,256 sq.mi. in Europe). Pop.: (1927 census) 13,648,270, (1945 census) 18,790,174, (June 1949 est.) 19,750,000. According to the 1945 census, European Turkey had 1,496,612 inhabitants (165 per sq.mi.) and Anatolia 17,293,562 (59 per sq.mi.). Languages (1935 census): Turkish 86.8%, Kurdish 9.3%, Arabic 0.9%, Greek 0.7%, Circassian 0.6%, Armenian 0.4%, Georgian 0.5%, others 0.8%. Turkey being a lay state no religion has primacy, although 97.7% of the population is Moslem. Other religions (1935 census): Christian 226,167 (Greek Orthodox 125,046, Gregorian Armenian 44,526, Roman Catholic 32,155, Catholic Armenian 11,229, Protestant 8,486, other Christian 4,725); Jewish 78,730. Chief towns (1945 census): Ankara (cap., 226,712); Istanbul (860,558); Izmir (Smyrna, 198,396); Adana (100,780); Bursa (85,919); Eskişehir (80,030). President of the republic in 1949: General Ismet Inönü; prime minister, Semsettin Günaltay.

History.—In 1949, once again January was marked by a political crisis in Turkey, when Hasan Saka tendered his resignation, his second cabinet thus coming to an end after seven months of political power. The president offered the premiership to Semsettin Günaltay. This selection came as a surprise, for the new premier was not widely known and had never held high office. He had, however, played an influential part within the Republican People's party, of the last general congress of which (in 1947) he had been chairman. He retained four members of the old government and his cabinet was regarded as a cross section of his party, marked by the inclusion of young men. His government was received by the press without enthusiasm and with prophecies of a short life; but by the end of 1949 the Günaltay cabinet had already enjoyed a longer life than its predecessor. Its program, opening with the assertion of continuity of the consistent policy of Turkey, proposed a reform of the electoral and press laws, neither of which met with any sympathy on the part of the opposition and party politics became sharper. A powerful weapon in the hands of the opposition was the fact that the president of the republic was at the same time a party man, being president general of the Republican People's party and the opinion was that he should divest himself of this political attribute. In June there was a shuffle in the cabinet but rumours of an impending resignation were falsified.

In the autumn a brief sensation was provoked by the announcement of a revolutionary plot, attributed to the National party, in which the president was to be murdered. This was clothed in such a fantastic atmosphere of contradictions that it was quickly dismissed and inquiry abandoned.

Foreign Relations.—In foreign affairs the policy of Turkey remained unchanged. It was based on the desire to develop a democracy on western lines, with friendship all around. Turkey sought no territory, but would not yield any of its own. On this line all its statesmen were firm. With the United States relations were most cordial, in view of the great contributions made by that country towards the development of Turkey, the construction of roads—its most vital requirement—the equipment of its agriculture and its fighting services on modern lines. A certain disappointment was felt that the North Atlantic treaty was not accompanied by a Mediterranean pact including Turkey. The Turks were resolved to play their full part in international movements in favour of peace and its representatives joined in August the ministerial committee and the consultative assembly of the Council of Europe at Strasbourg. (*See* EUROPEAN UNION.)

Turkey's relations with its neighbours were cordial or at least correct. Resentment against the U.S.S.R. was caused by the mysterious death—reported as suicide—in a train between Moscow and Batumi of Fuat Güzaltan, a former captain of the general staff, the Turkish diplomatic courier. The press regarded this as an assassination and matters were not improved when the U.S.S.R. submitted a bill for £T40,000 for the cost of the inquiry and return of the body.

Relations with Bulgaria were strained by several frontier incidents, such as the kidnapping of Turkish soldiers and peasants on the frontier and the explosion of a bomb at the Turkish consulate at Plovdiv. These were not mollified by the stories told by Turkish refugees of the ill-treatment of their kinsmen in Bulgaria.

Economics.—The year was economically a critical one for Turkey. Prolonged drought ended in a failure of the harvest and in places violent floods caused immense damage and loss of life. From being a substantial exporter of grain, Turkey was obliged to import great quantities of wheat from the United States, Canada and elsewhere. The failure of the corn crop in the northern provinces caused great distress and grave concern to the government.

The fish catches were also poor and a contractor who had agreed to provide the British government with preserved fish to the value of £500,000 was unable to fulfil his obligations. Further it was reported in the press that Turkey, a fish-exporting country, had actually imported preserved fish.

The devaluation of the pound sterling, though long rumoured, came as a bombshell in commercial circles. The government at once announced that the Turkish lira would not be devalued and the central bank quickly stated that the new rate of the Turkish lira to the pound sterling would be £T7.84 to 7.91 instead of £T11.28. (Exchange rate, Nov. 15, 1949, placed the lira at 35.71 U.S. cents.) Help from the United States continued on a moderate scale; the allocation to Turkey, proposed by the O.E.E.C. on Oct. 13, amounted to $59,000,000.

In foreign trade there was a great reduction in compensation business, to the satisfaction of those who saw in it the main cause for the fluctuation of prices. A marked feature was the revival of trade with western Germany. It should be remembered that before World War II Germany supplied 45% of Turkish imports and took 43% of Turkish exports.

Miscellaneous.—Laying the foundation stone of a new tuberculosis hospital at Ankara, the prime minister pointed out that a law had been passed to establish associations to fight consumption and expressed the hope that by 1959 the number of such hospitals would be doubled. It was the intention to set up a network of them over the country.

In education steady progress was being maintained and it was stated that in 1949 about a thousand new schools were opened. About 1,900 Turkish students were studying abroad.

Turkish civil aviation was successful. It held the record for the lowest rate of accidents. Whereas Turkish air lines carried 73,000 passengers in 1948, the 100,000 mark was passed in 1949. In 1948 the profit made was shown as £T3,000,000: in 1949 it was more than £T4,000,000.

Interest, not unmixed with irony, was roused by a private American expedition to search for the remains of Noah's ark on Mount Ararat. As this is a frontier district, the military authorities were concerned and it had some political repercussions: the U.S.S.R. would not credit it as a genuine scientific search and regarded it as an attempt at spying on their territory.

Union of Soviet Socialist Republics.

The former Russian empire, a Eurasian state covering parts of eastern Europe and northern and central Asia, is a federation of soviet socialist republics. Area (Sept. 17, 1939): 8,173,557 sq.mi. Pop. (Jan. 17, 1939, census): 170,467,186. In 1939 the union consisted of 11 republics of which the Russian Soviet Federated Socialist Republic was by far the largest (78% of the whole territory and 64% of the population). Of the remaining 36% of the population, almost one-half lived in the Ukranian Soviet Socialist Republic (2% of the territory) and the other half in the nine other republics of the union. The U.S.S.R. is inhabited by almost 100 different nationalities speaking different languages. In Jan. 1939 Russians constituted 58.4% of the population, Ukrainians 16.6% and Byelorussians 3.1%. None of the other nationalities, all non-Slav and most of them non-Europeans, reached 3% of the total. The most important were Uzbeks 2.9%, Tatars 2.5%, Kazakhs 1.8%, Jews 1.8%, Azerbaijanis 1.3%, Georgians 1.3% and Armenians 1.3%.

In 1939 the U.S.S.R. consisted of the following republics:

	Capital	Area in sq. mi.	Population
Russian S.F.S.R.	Moscow	6,372,860	109,278,614
Ukrainian S.S.R.	Kiev	171,777	30,960,221
Byelorussian S.S.R.	Minsk	49,022	5,567,976
Georgian S.S.R.	Tiflis (Tbilisi)	27,020	3,542,289
Azerbaijan S.S.R.	Baku	33,196	3,209,727
Armenian S.S.R.	Erivan	11,580	1,281,599
Uzbek S.S.R	Tashkent	145,908	6,282,446
Kazakh S.S.R.	Alma-Ata	1,059,184	6,145,937
Kirghiz S.S.R.	Frunze	76,042	1,459,301
Tadzhik S.S.R.	Stalinabad	55,584	1,485,091
Turkmen S.S.R	Ashkhabad	171,384	1,253,985

Between 1939 and 1945 the U.S.S.R. considerably expanded its territory. In Europe the following areas were annexed:

	Area in sq. mi.	Population
Estonia	18,357	1,134,000
Latvia	25,395	1,994,500
Lithuania (including the Vilnius area)	25,173	3,032,000
From Finland	17,596	100,000*
From Poland (excluding the Vilnius area)	64,824	10,315,000
From Rumania (Bessarabia and N. Bukovina)	19,338	3,650,000
From Czechoslovakia (Subcarpathian Ruthenia)	4,856	725,400
From Germany (N.E. part of East Prussia)	5,096	830,000

*About 400,000 Karelians left in 1944 to resettle in Finland.

In Europe the territorial possessions of the U.S.S.R. had increased by 180,635 sq.mi., with a population of 21,780,900. From Japan the U.S.S.R. acquired Karafuto (southern Sakhalin), an area of 13,935 sq.mi. with a population of 331,900, and the Chishima or Kuril Islands (3,994 sq.mi.; pop. *c.* 90,000). In addition the formerly independent republic of Tannu Tuva (64,000 sq.mi.; *c.* 65,000) was annexed to the union.

As the result of this territorial expansion the U.S.S.R. after World War II formed a federation of 16 republics. The five new ones were: the Karelo-Finnish S.S.R. (cap. Petrozavodsk), consisting of the territory ceded by Finland and of the former autonomous soviet Karelia; the Moldavian S.S.R. (cap. Chisinau or Kishinev), consisting of most of Rumanian Bessarabia and the former autonomous soviet Moldavia; and Estonia (*q.v.*), Latvia (*q.v.*) and Lithuania (*q.v.*) transformed into soviet republics. Total *de facto* area: 8,436,121 sq.mi. Addi-

"THE LATEST EDITION," a 1949 cartoon by Alexander of the *Philadelphia Bulletin*

tion of the figures quoted above would give a total population of 192,735,000. The official estimate for 1940 was 193,000,000 (E. Davydov in *Bolshaya Sovietskaya Entsiklopedia: S.S.S.R.*, suppl. vol., Moscow, 1948). The only postwar estimate, published in *Pravda* of Jan. 23, 1946, by Gheorghy F. Alexandrov, then propaganda chief of the All-Union Communist party, gave the same figure. If this were correct, it would be necessary to assume that by 1946 Soviet war losses were compensated by the natural increase of population.

Chief towns (1939 census): Moscow (*q.v.*) (4,137,018); Leningrad (3,191,304); Kiev (846,293); Kharkov (833,432); Baku (809,347); Gorki, formerly Nizhni Novgorod (644,116); Odessa (604,223); Tashkent (585,005); Tiflis (519,175); Rostov-on-Don (510,253); Dnepropetrovsk (500,662). Chairman of the presidium of the supreme soviet of the U.S.S.R., Nikolai M. Shvernik; chairman of the council of ministers, Premier Joseph V. Stalin (*q.v.*).

History.—The year 1949 in the history of the U.S.S.R. was notable for events both in the external field and also in internal affairs such as the announcement concerning an atomic explosion on soviet territory which seemed to bear directly on the relations between the Soviet Union and other powers. As far as internal history was concerned, external observation could detect little that was new. It was generally assumed that, under much the same leadership as previously, the ideological, economic and administrative patterns of soviet society and government were being steadily consolidated with little to indicate the success or failure of such efforts beyond the somewhat controversial statistics about economic achievements that the soviet government from time to time put forth. Despite such events as the Congress of the Supporters of Peace which met in Moscow in August, there was still the minimum of contact between the peoples of the Soviet Union and those of the rest of the world, since the foreign delegates to such functions were chosen from those known in advance to be devoted to the soviet cause and the occasional visits abroad of soviet intellectuals were clearly also intended as methods of spreading propaganda rather than of genuine inquiry. The limitations upon the freedom of movement of members of the Moscow diplomatic corps; the continued evidence of the disfavour with which soviet citizens employed by, or having contacts with, foreigners were regarded by their own government; the small number of foreign journalists stationed in the Soviet Union; and even such a thing as the compulsory channeling of the exchange of books and periodicals through a department of the soviet foreign ministry—were all in the nature of supports for this policy of self-isolation. In view of this policy reports about disputes within the soviet hierarchy and matters connected with the eventual succession to the authority of Premier Joseph Stalin were rightly treated with total reserve by responsible commentators in other countries.

This self-isolation was however itself a part of a general attitude on the part of the soviet regime that explained its attitude to the various matters that arose in foreign affairs. One could sum it up by saying that during 1949 the object of the Soviet Union seemed to be to consolidate its hold over the eastern European countries which it dominated to the extent that this was possible without an armed breach with the western powers and without formally renouncing the principal foundations of the postwar settlement, the United Nations charter and the Potsdam agreement. To this primary object, other issues both political and economic appeared wholly subordinate.

Assimilation of People's Democracies.—In as far as the so-called satellite countries were concerned, the process of assimilation into the soviet system was carried on with little interference from the rest of the world. It took the form of combatting what appeared to be the most powerful forces opposing the process—religious organizations, in particular the Roman Catholic Church in Hungary, Poland and Czechoslovakia, and those elements which might seek to give local communism a nationalist twist in the form of an insufficient subordination of local matters to the total requirements of soviet planning. It also took the less spectacular form of continuing the transformation of the political and economic institutions of the so-called people's democracies into the single-party socialism of the Soviet Union itself. In each case, since the countries maintained a formal independence, it is proper to treat these issues as belonging to their own internal history; but for the sake of example one might point to Hungary (*q.v.*) as exemplifying all these tendencies. The trial of Joseph Cardinal Mindszenty in February marked one stage of the struggle, that of Laszlo Rajk in September, the other. In between, in August, a new constitution had been adopted, closely modelled on the 1936 soviet constitution. But for the fact that the collectivization of agriculture was still in the future, it could be argued that the final stage in such assimilation—the incorporation of Hungary within the Soviet Union—was not far off. Still more striking an evidence of the completeness of soviet control was provided by Poland (*q.v.*). It was there announced early in November that the Soviet Marshal K. K. Rokossovsky, a Pole by birth, had been released by the Soviet Union to act as commander in chief and minister of defense of Poland and had assumed Polish citizenship for the purpose. In face of such demonstrations of soviet power, there was little to be hoped for from western protests about the violations of human rights under the peace treaties to the three former German satellites or from the protest in November against the convening of a conference to carry out the decisions regarding Danubian navigation contained in the Belgrade convention of Aug. 18, 1948.

It was argued that some at least of the soviet intransigence where local Communist attitudes were concerned was due to the fear that the successful resistance of Marshal Tito to the economic and propaganda weapons of the Cominform might inspire emulation elsewhere. There was indeed no doubt but

Left: FIELD WORKERS of the Repetek Sand and Desert station in Turkmen, U.S.S.R., where problems of desert pastures and their distribution among collective and state farms were being studied in 1949

Right: MODEL OF A 26-story building to be the main structure on the campus of Lomonosov Moscow State university, displayed by A. V. Rudnev, one of a group of soviet architects honoured for its design. Scheduled for completion in 1951, it would be one of the tallest buildings in the U.S.S.R.

Left: MEMBERS OF THE YOUNG PIONEERS, the boys with shaved heads, the girls uniformly in pigtails, serving as flower-bearers, colour-bearers and trumpeters at the 1949 congress of the Komsomols in Moscow. Komsomols (Lenin Young Communist League of the Soviet Union) are the youth group next higher in age to the Young Pioneers

Right: TRADE SCHOOL STUDENTS getting practice in the turning shop of a soviet factory in 1949 that the Tito "heresy" was regarded with more aversion than outright capitalism, since the ideological foundation of the soviet position was that there could be no halfway house between total acceptance of the soviet lead and full participation in the alleged aggressive plans of the war-mongering Anglo-Saxon imperialists. The Soviet Union took, therefore, a full share in the increasing pressure brought upon Tito. (*See* also YUGOSLAVIA.)

Soviet Policy in Germany.—The course of events in Germany, where the year began with the Berlin air lift still in progress and with consequent tension between the Soviet Union and the western powers, was more complicated. After some rather oblique approaches from the soviet side, the foreign ministers eventually met again at the end of May and after a month of discussion sufficient agreement on the local issue was reached to permit the partial lifting of the soviet blockade and the gradual winding up of the air lift in the autumn. Nevertheless, the affairs of Berlin (*q.v.*) continued to add their quota of trouble to the international situation. On the other hand, in the second half of 1949, attention shifted to more general aspects of the German problem, with the soviet authorities still torn apparently between their fear of a revived German nationalism and their determination to make what they could out of their claims to be the real protagonists of German unity and of their contention that it was the western allies who were splitting the country. Matters were precipitated by the inauguration of the Bonn government in Western Germany; at the beginning of October the Russians countered this move by setting up a German People's Republic in the eastern zone. The form of the new regime was closely modelled on that of the other satellite countries and it had all the appurtenances of sovereignty including a foreign minister. But despite a message from Premier Stalin to Wilhelm Pieck, president of the new republic, in which the soviet leader referred to these events as "a turning point in the history of Europe," it rapidly became clear that the Russians were not proposing in the immediate future either to withdraw their troops or to hand over the levers of control. The appointment of a soviet diplomatic representative to the new government did not appear to diminish the importance of the position of Gen. Vasili I. Chuikov, transformed into the head of a control commission, nor of his political advisers, Ivan Semichastnov and Vladimir Semenov. The Russians appeared unwilling to do anything that might render more difficult contacts between their friends in eastern and in western Germany or to make impossible a resumption of four-power talks under the provisions of the Potsdam agreement which they continued to invoke. (*See* also GERMANY.)

Soviet Policy in China.—Outside Europe the most important area of soviet interest was China where the collapse of the main nationalist resistance led to sweeping advances by the Chinese Communist forces. The soviet government did not appear to wish to precipitate a crisis in this field, for instance by immediate insistence on the replacement of the Chinese delegation at U.N.; but all evidence pointed to a continued close connection between the Chinese Communists and the Russians. In October it was reported that large numbers of soviet technical staff had arrived in Peiping; and in as far as divisions of opinion among the Chinese Communist leaders could be detected, it was held that the prosoviet wing headed by Liu Shao-chi, secretary-general of the party, had clearly got the upper hand. It was he who made the keynote speech at the conference of Trade Unions of Asiatic and Australasian countries, held in Peiping in November, at which a permanent bureau was set up to perform it seemed, the functions of a Cominform for the far east. (*See* CHINA; COMMUNISM.)

Atomic Energy.—The difference between the soviet and the western approach to the control of atomic energy continued throughout the year. The matter was given a new complexion by the announcement from Washington, D.C., on Sept. 23 that the western governments had evidence of a recent atomic explosion in the Soviet Union. Official soviet comment on Sept. 25 was to the effect that much blasting work for peaceful purposes had recently been going on in Russia and that this might have attracted outside attention. On the other hand it was recalled that Vyacheslav M. Molotov had declared as long ago as Nov. 1947 that the atomic bomb was no longer a secret. Supporting the soviet proposal before the Atomic Energy commission of the United Nations for simultaneous conventions on prohibition and control, Andrei Y. Vishinsky declared in a speech on Nov. 10 that the Russians were using atomic energy not to stock-pile bombs but for peaceful purposes, for razing mountains and irrigating deserts. This statement was received with some scepticism by foreign experts. The soviet-licensed German press located the explosion at the Tingai Gates between the Urals and the Kazakh mountains.

Home Politics.—The structure of soviet government remained substantially intact, though a continuation was noticed of the previous tendency to merge into single ministries various specialized economic ministries that had been given independent existence as a part of the wartime production drive. The total number of ministries was thus reduced. More important seemed certain changes in personnel.

On March 4, Molotov was replaced as minister of foreign affairs by his deputy Vishinsky whose own place was taken by Andrei A. Gromyko, the permanent soviet delegate to the United Nations. At the same time as Molotov was replaced, the minister of foreign trade, Anastas I. Mikoyan was also replaced by his deputy Michael A. Menshikov. Since both Molotov and Mikoyan remained deputy prime ministers and members of the Politburo, the political significance of the changes

"JOE'S AMUSEMENT PARK: 'What I loses on the swings . . .,' " a cartoon by Illingworth, published in the May 4, 1949, issue of *Punch* (London) remained uncertain.

On the other hand, the dismissal on March 14 of Nikolai A. Voznesensky from his post as chairman of the State Planning commission, from his deputy premiership and from the Politburo was thought to imply his disgrace. He was succeeded in his two administrative capacities by Maxim Saburov. On the same day it was announced that Ivan Golyakov was replaced as president of the supreme court by Anatoli A. Volin.

On March 24 Marshal Nikolai A. Bulganin was replaced as minister of the armed forces by Marshal Alexander M. Vasilevsky whose place as first deputy minister was filled by Marshal Vasili D. Sokolovski.

The number of deputy prime ministers was raised to 13. They were: V. M. Molotov (first deputy prime minister), Andrei A. Andreyev, Marshal L. P. Beria, Marshal N. A. Bulganin, Lazar M. Kaganovich, A. N. Kosygin, Alexei Krutikov, Vyacheslav A. Malyshev, G. M. Malenkov, A. I. Mikoyan, Ivan Tevosyan, Marshal Klementy E. Voroshilov and Maxim Saburov.

After the dismissal of Voznesensky the 12 members of the Politburo were: Stalin, Andreyev, Beria, Bulganin, Kaganovich, Nikita S. Krushchev, Kosygin, Malenkov, Mikoyan, Molotov, N. M. Shvernik and Voroshilov.

In view of the importance attached to outward signs of the order of precedence within the top soviet hierarchy, some significance was attached to the choice of Georgi M. Malenkov to make the keynote speech in November at the celebrations of the anniversary of the revolution. Slightly before this the possibility of a further shake-up in the government was suggested by an attack in *Pravda* on the editorial board of the soviet trade union organ *Trud*, followed by a strongly worded attack on officials of the important ministry of labour reserves for falsifying accounts in an attempt to give a false picture of success. The criticism of *Trud* was the more remarkable in that in April the soviet trade unions had held their 10th congress—the first for 17 years.

In the first quarter of 1949, there were numerous congresses of the Communist parties of the constituent republics of the U.S.S.R. and of local party organizations. These did little more than restate the current themes of soviet propaganda but there was some suggestion that local nationalism was still regarded as a threat in both the Ukraine and Byelorussia. And later in the year there were reports of purges in the Communist parties of the Ukraine, Uzbekistan and Kazakhstan. Some internal divergences of opinion might also explain why the expected congress of the All-Union Communist party did not take place during the year—although there was no evidence as to the nature of the disagreements in question. In April, the 11th congress of the Young Communist league (Komsomol) was held and new rules for the organization were adopted, stress being laid on its responsibility for carrying out the decisions of the party and the government in the economic and cultural sphere.

Cultural Life.—There was no abatement in 1949 of the soviet claims that the Russians had been responsible for all the most important scientific achievements of the past and were also culturally the leading nation. Nor was there any slackening of pressure upon all forms of cultural activity to lend themselves wholeheartedly to the service of the regime and its economic social and political ends. Any tendency to look outside the U.S.S.R. for inspiration was branded as decadent cosmopolitanism. In the spring the *Literaturnaya Gazeta* published a denunciation of a large number of literary critics for indulging in this heresy. It was noted that almost all of the persons denounced either had Jewish surnames or had their former Jewish names given in brackets. This was unprecedented in the soviet press; and the anti-Semitic nature of the campaign was subsequently made clear in other ways. Foreign commentators were, however, prone to see in this less a cultural than a political manifestation, a fear lest soviet Jews might however mildly feel inclined to seek some kind of contact with the new state of Israel and thus expose themselves to foreign contamination. The measures against Zionism in the satellite countries and the frictions between the Israeli government and some of the people's democracies were witness to the same thing. Soviet patriotism seemed not merely to demand total allegiance but to emphasize its Russian character, rather than the multinational facets so much in evidence before World War II. (*See* also ATOMIC ENERGY; BULGARIA; COMMUNISM; FINLAND; MOSCOW; POLAND; RUMANIA; RUSSIAN LITERATURE; UNITED NATIONS.) (M. BF.)

Education.—Schools (1949): elementary and secondary, about 220,000, pupils, about 34,000,000; secondary technical schools, about 3,500, pupils, about 1,094,000; universities and other schools of higher education 837, students 770,000.

Finance.—Budget (1949 est.): revenue 446,000,000,000 roubles; expenditure 415,400,000,000 roubles. In Nov. 1949 the official rate of exchange was 5.30 roubles=$1 U.S.

Trade and Communications.—A. I. Mikoyan, former minister of foreign trade, stated on Dec. 21, 1949, that the volume of foreign trade in 1949 was more than double that of pre-World War II. He added that trade with the "capitalist countries" had decreased and amounted only to one-third of the total; and that trade with the people's democracies amounted to two-thirds of the total.

In 1940 railroads measured 105,300 km. By 1949 this had been increased considerably by new construction. Freight transported in 1940 was 415,000,000,000 tons-km. In 1949 there were 11,500 km. of all-weather motor roads. Motor vehicles in 1948 were estimated at 760,000. Water shipping (1948) totalled 1,299,300 gross tons. Air transport lines (1949) were 175,000 km.

Agriculture.—Crop production (1940, in metric tons): grain crops 119,000,000; sugar beets 21,800,000; potatoes 84,200,000; cotton 2,700,000. Livestock (1945; target for 1950 in parentheses): horses 10,500,000 (15,500,000); cattle 28,000,000 (32,500,000); pigs 10,400,000 (17,000,000); sheep and goats 69,400,000 (83,700,000). These figures do not include personal possessions of collective farmers, peasant households and other workers. These in April 1949 included 30,000,000 cattle, 7,200,000 pigs, 26,500,000 sheep and goats.

Industry.—The Central Statistical board pointed out that in the fourth quarter of 1949 the average monthly output of gross industrial production exceeded the 1940 level by 53%. Production estimates, 1948, with planned production for 1950 in parentheses, in metric tons, except where otherwise indicated: coal 200,000,000 (250,000,000); crude oil 29,100,000 (35,400,000); electricity 60,000,000,000 kw.hr. (82,000,000,000 kw.hr.); pig iron 15,000,000 (19,400,000); steel 18,300,000 (25,400,000). The Central Statistical board stated that the output of crude oil in the fourth quarter of 1949 had passed the level of the five-year plan for 1950.

(K. SM.)

Unitarian Church.

The first postwar Congress of the International Association for Liberal Christianity and Religious Freedom (founded in 1900 at the 75th anniversary of the American Unitarian association) was held in Amsterdam, Netherlands, in July 1949 with 425 delegates from 22 European and American countries attending. The subject, "Message and Mission of Liberal Religion," was discussed in four sections dealing with theology, social problems, religious education and world religions. John Howland Lathrop of Brooklyn, N.Y., was succeeded as president by H. Stewart Carter of Cambridge, England. The next triennial congress was scheduled for 1952 in New York city.

A second important gathering was the biennial conference of the American Unitarian association in Portland, Ore., in August. The program centred around "The Challenge of the New Day" and the Unitarian answer derived from the twofold faith in the divinely creative potential in man and in what man can be. Practical programs for Unitarian effort resulted, and action was taken looking toward union with the Universalist Church. Commissions set up by both denominations submitted a joint resolution "concerning the association of self-governing congregations wishing to enlist in the extension of organized religion on the basis of local autonomy in matters of government and religious belief." If by June 1, 1950, 50% of the parish churches had voted affirmatively for union, the commissions would proceed with a specific plan. A still wider fellowship of churches based upon freedom of faith and congregational polity was foreseen as a result of the union of the two denominations.

A report submitted by the Interdenominational committee of the American Unitarian association, the Universalist Church of America and the American Ethical Union proposed a common action project. It recommended that this first project should be concerned with the problems of mental health on the three levels of education and survey, remedial action and application of principles of mental health to church life. The project was adopted for the following biennium.

A new high in legal membership in Unitarian churches was achieved in 1949, with the rate of growth the greatest in the history of the denomination. (*See* CHURCH MEMBERSHIP.)

(J. H. L.)

United Church of Canada.

The United Church of Canada which in 1925 united with the Presbyterian Church in Canada, the Methodist Church (Canada) and the Congregational Churches in Canada, reported for 1948 a membership of 791,677 with 1,861,683 persons under pastoral oversight, a Sunday school enrolment of 503,251 and 6,494 preaching places. The church owned property worth approximately $114,498,936 and raised a total of $20,672,466 for all purposes. The missionary and maintenance givings of the church in 1948 totalled $2,529,370, an increase of $402,848 over the previous year.

Among the important features in the life of the United Church during 1949 were the reception of 28,367 persons into membership on profession of faith, 58% of whom were adults, as a result of visitation evangelism undertaken largely by laymen; a vigorous campaign to secure recruits for the ministry; and the sending of more than $74,000 for relief to churches in Europe and in Asia.

The church was saddened by the loss of two former moderators: the Very Rev. Aubrey S. Tuttle, who was moderator from 1940 to 1942, and who gave distinguished leadership in the field of higher education and the Very Rev. J. R. P. Sclater, who had been taking a prominent lead in seeking to bring about ultimately organic union with the Church of England in Canada. Dr. Sclater was moderator from 1942 to 1944.

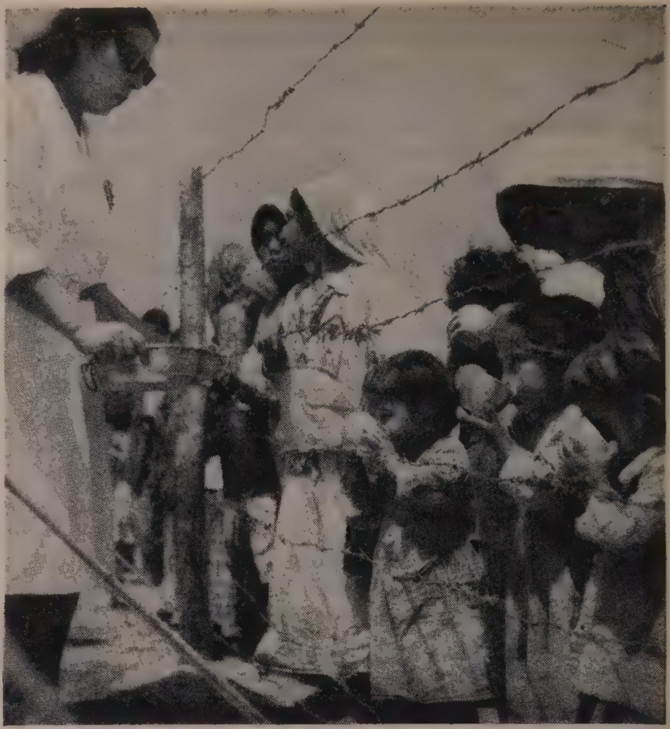
United Kingdom: *see* GREAT BRITAIN & NORTHERN IRELAND, UNITED KINGDOM OF.

United Nations.

During its fourth year, the United Nations continued to be handicapped by the lack of co-operation between the Soviet Union and the Western Powers. In addition to preventing the conclusion of treaties of peace with Germany and Japan, this circumstance prevented the Security council from functioning as the organ primarily responsible for the maintenance of international peace and security as the charter had anticipated. In addition, it slowed down and in some respects obstructed the work of other U.N. organs. Because of the flexibility of its organization and procedures, however, the U.N. and the specialized agencies were able to achieve important results in the areas of economic and social co-operation and the improvement of backward areas; even in the political field, notable successes were registered.

Membership.—Membership was increased during the year to 59 by the admission of Israel. At the close of 1949 membership was as follows: Afghanistan, Argentina, Australia, Belgium, Bolivia, Brazil, Burma, the Byelorussian Soviet Socialist Republic, Canada, Chile, China, Colombia, Costa Rica, Cuba, Czechoslovakia, Denmark, the Dominican Republic, Ecuador, Egypt, El Salvador, Ethiopia, France, Greece, Guatemala, Haiti, Honduras, Iceland, India, Iran, Iraq, Israel, Lebanon, Liberia, Luxembourg, Mexico, the Netherlands, New Zealand, Nicaragua, Norway, Pakistan, Panamá, Paraguay, Peru, the Republic of the Philippines, Poland, Saudi Arabia, Siam, Sweden, Syria, Turkey, the Ukrainian Soviet Socialist Republic, the Union of South Africa, the Union of Soviet Socialist Republics, the United Kingdom, the United States of America, Uruguay, Venezuela, Yemen and Yugoslavia.



FOOD DISTRIBUTION to Arab women and children at a refugee camp in Palestine where daily food rations were provided in 1949 from funds allocated by the U.N. International Children's Emergency fund

New applications were received from the Republic of Korea (South Korea), Nepal and the Democratic People's Republic of Korea (North Korea). Favourable action by the Security council on the first two was prevented by the negative vote of the Soviet Union. The council refused to approve a soviet proposal to refer the application of the Democratic People's Republic of Korea to its Committee on the Admission of New Members. The Security council reconsidered the 12 applications which had previously failed of approval: *i.e.*, the applications of Albania, Austria, Bulgaria, Ceylon, Finland, Hungary, the Republic of Ireland, Italy, Mongolian People's Republic, Portugal, Rumania and Trans-Jordan (Jordan) but was unable to reach an affirmative decision on any of them. A soviet proposal to approve all 12 applications plus that of Nepal en bloc was defeated.

During the fourth session, the general assembly adopted resolutions requesting the Security council to reconsider the membership applications of Austria, Ceylon, Finland, the Republic of Ireland, Italy, Jordan, Republic of Korea, Portugal and Nepal. These nine had failed of approval because of the negative vote of the Soviet Union. The assembly also voted in its fourth session to request the International Court of Justice to give an advisory opinion on whether a state could become a member of the United Nations by vote of the general assembly without a favourable recommendation by the Security council. The permanent members of the Security council were urged to temper their use of the veto in considering applications for nembership. A soviet proposal that the general assembly recommend favourable reconsideration by the Security council of all pplications except the Korean was defeated although it had he support of 12 members.

The Principal Organs.—The general assembly met twice luring 1949. Because of failure to dispose in Paris of the items ppearing on the agenda of its third session, a second part of he third session was held at Lake Success, N.Y., from April 5 o May 18 with Herbert V. Evatt (Australia) continuing to erve as president. The fourth regular session of the general ssembly met at Lake Success from Sept. 20 to Dec. 10. Carlos P. Romulo (Republic of the Philippines) was elected president. The general assembly disposed of an agenda of 68 items, including many of pressing political, economic and social importance. t adopted the recommendations of a special committee for mproving its methods of work and rules of procedure. It voted he continuation of the United Nations Special Committee on he Balkans, the United Nations Commission on Korea and the nterim committee as subsidiary organs.

The Security council met less frequently during 1949 than in previous years. Though the charter requires that the Security council be so organized as to be able to function continuously, nd the provisional rules provide that the interval between neetings may not exceed 14 days, the failure of the permanent nembers to agree on questions brought before the council, and he consequent tendency to appeal to the general assembly when ossible, resulted in a decrease in council activity. During 1949 he Security council was composed of China, France, the Soviet Jnion, the United Kingdom and the United States (permanent nembers) and Argentina, Canada, Cuba, Egypt, Norway and the Jkraine (nonpermanent members). During its fourth session, he general assembly elected Ecuador, India and Yugoslavia for wo-year terms beginning Jan. 1, 1950, to succeed Argentina, Canada and the Ukraine. The election of Yugoslavia was bitterly pposed by the Soviet Union, who favoured the election of Czechoslovakia on the ground that it had become an established ule that one nonpermanent member should be a member nominated by the Soviet bloc.

The Economic and Social council held two sessions during 949, its eighth session held at Lake Success from Feb. 7 to March 18, and its ninth session held at Geneva, Switzerland, rom July 5 to August 15. James Thorn (New Zealand) was lected president at the beginning of the eighth session. During 949 the council was composed as follows: with terms ending Dec. 31, 1949—Byelorussia, Lebanon, New Zealand, Turkey, United States and Venezuela; with terms ending Dec. 31, 1950—Australia, Brazil, Denmark, Poland, the Soviet Union and the United States; and with terms expiring Dec. 31, 1951—Belgium, Chile, China, France, India and Peru.

During its fourth session the general assembly elected the ollowing to membership for three-year terms beginning Jan. 1, 950: Canada, Czechoslovakia, Mexico, Iran, Pakistan and the United States. In its two sessions, the council dealt with a great variety of subjects but centred its attention particularly on current economic trends, action to maintain and achieve full employment and economic stability, technical assistance to underdeveloped areas, and the co-ordination of the activities of pecialized agencies.

The Trusteeship council also held two sessions during 1949, ts fourth and fifth, both at Lake Success. The fourth session vas held from Jan. 24 to March 25 with Liu Chieh (China) erving as president. The fifth session was held from June 15 to July 22 with Roger Garreau (France) as president. The membership of the council during 1949 was as follows: members dministering trust territories—Australia, Belgium, France, New Zealand, United Kingdom and United States; members by virtue of permanent seats on the Security council—China and the Soviet Union; and members elected by the general assembly—Iraq and Mexico for three-year terms ending Dec. 31, 1949, and Costa Rica and the Republic of the Philippines for three-year terms ending Dec. 31, 1950. On Oct. 20, the general assembly elected Argentina and Iraq for three-year terms beginning Jan. 1, 1950, and also elected the Dominican Republic to serve the unexpired term of Costa Rica who had resigned. During 1949 the Trusteeship council made significant progress in developing its techniques of operation and standards of evaluation.

Maintenance of International Peace and Security.—The work of the United Nations in this field was handicapped by the state of relations between the Soviet Union and the Western Powers. This was particularly apparent when consideration was being given to the international control of atomic energy and the regulation of conventional armaments. Some notable achievements, however, were registered. Though the India-Pakistan question remained deadlocked and tension continued to exist in the Balkans, the U.N. could claim partial credit, at least, for the Indonesian settlement and the lifting of the Berlin blockade. and its intervention in Palestine had achieved the end of hostilities though the political dispute still remained unsettled.

The India-Pakistan question remained before the Security council for the whole year without any final settlement being reached. The United Nations Commission for India and Pakistan reported to the Security council on Jan. 13, 1949, that India and Pakistan had issued cease-fire orders on Jan. 1. This action was followed by the appointment on March 21 of Adm. Chester W. Nimitz (United States) as the U.N. administrator for the plebiscite in Jammu and Kashmir. The U.N. commission presented India and Pakistan with truce terms on April 28. On June 6 the commission announced that the proposals had not been accepted by either side. On June 10 the commission agreed to make a further effort to achieve a truce agreement. On July 8 both India and Pakistan accepted an invitation from the U.N. commission to hold a joint meeting of their military representatives at Karachi on July 18 in order to demarcate the cease-fire line. Agreement was reached on about 200 mi. of the cease-fire line in Kashmir, but the meeting adjourned to July 26 in order that the delegations might consult further with their governments. The U.N. commission reported at the end of the year that it had failed to end the dispute and suggested to the Security council that it be disbanded and that authority be vested in one person in an attempt to end the deadlock. Troops of both the Indian and Pakistan governments remained within Kashmir at the end of the year, thus preventing the plebiscite from being taken. (*See* also INDIA, DOMINION OF; PAKISTAN, DOMINION OF.)

The U.N. continued to deal with the Balkan situation throughout the year. The U.N. Special Committee on the Balkans sent a report to the secretary-general on March 4, in which it discussed the plight of the refugees from the civil war in Greece. The special committee continued to investigate allegations of frontier provocations. Early in the year Bulgaria made claims of provocation by Greek troops on Bulgarian territory, and Greece complained to the committee that Greek troops had been fired upon from Yugoslav territory. The general assembly during the second part of its third session set up a special conciliation committee, headed by Evatt, to facilitate agreement between Greece and Albania, Yugoslavia and Bulgaria, but the endeavour failed. The U.N. special committee, in a report to the general assembly covering the period from Oct. 1948 to July 1949, stated that Albania, Bulgaria and Yugoslavia had refused to recognize the committee, that Albania and Bulgaria had continued to give moral and material assistance to the Greek guerrilla movement, that aid from Yugoslavia which had been on a large scale early in the year was diminishing, and that the present situation constituted a threat to the political independence and territorial integrity of Greece and to peace in the Balkans. The committee submitted a supplementary report to the assembly on Sept. 16. The committee asked that the assembly again call on Albania and Bulgaria to cease giving aid to the Greek guerrillas and to find Albania primarily responsible for the threat to the peace in the Balkans. The committee also expressed concern at increasing support given the guerrillas by states not bordering upon Greece. The first committee of the general assembly voted unanimously on Sept. 29 to set up a conciliation committee to work out a settlement between Greece and its northern neighbours, the committee to consist of the president, the secretary-general and the chairman and vice-chairman of the first committee. The conciliation committee reported on Oct. 18 that it had failed to achieve an agreement. On recommendation of the First committee, the assembly adopted a resolution asking members to impose a complete arms embargo against Albania and Bulgaria as long as the two countries continued to give aid to the Greek guerrillas. The resolution also asked the two countries to desist from interference in Greece's internal affairs, continued the life of the special committee and asked it to continue observation of border incidents and attempt to seek a basis for conciliation. (*See* also GREECE.)

The Indonesian situation, at the stage of armed conflict between Netherlands and Indonesian forces at the beginning of 1949, seemed satisfactorily resolved by the end of the year. The Committee of Good Offices, established by the Security council on Aug. 25, 1947, reported on Jan. 7, 1949, that the Netherlands' orders for the end of hostilities in Java and Sumatra did not comply satisfactorily with the Security council's recommendation of Dec. 28, 1948. Dutch military action was subsequently severely criticized. A strongly worded resolution was passed on Jan. 28, asking that both sides immediately discontinue military operations, that the Netherlands release all political prisoners and return them to Djokjakarta, that negotiations be initiated to establish a federal government in Indonesia and that sovereignty be transferred to this government not later than July 1, 1950. The name of the Committee of Good Offices was changed to the United Nations Commission for Indonesia, and the powers of the commission were enlarged. The commission reported to the Security council on March 1 that no agreement had been reached and that this failure was due to a Netherlands refusal to comply with the resolution of Jan. 28. Subsequently, the council asked that the commission assist in helping Netherlands and Indonesian representatives reach agreement as soon as possible. The commission suggested that discussions be held in Batavia, and both sides agreed. On May 7 agreement was reached between the two parties on important issues including the cessation of hostilities and the return of the republican government to Djokjakarta. On July 6 the republic was restored to its former capital, Djokjakarta. On Aug. 3 both the Netherlands and the republic issued orders to end all hostilities. On Aug. 23 meetings began at The Hague to affect a transfer of sovereignty from the Netherlands to the Indonesian Republic. These meetings took the form of negotiations between the two countries and were not held directly under U.N. auspices. The round table discussions proved successful, and on Nov. 2 agreements were signed providing for the transfer of sovereignty over Indonesia to the Republic of the United States of Indonesia by Dec. 30, 1949. The general assembly adopted a resolution approving the agreement. Two similar resolutions failed to pass the Security council because of the negative vote of the Soviet Union. On Dec. 27, the Netherlands transferred full sovereignty over Indonesia to the Republic of the United States of Indonesia. (*See* also INDONESIA, REPUBLIC OF THE UNITED STATES OF; NETHERLANDS OVERSEAS TERRITORIES.)

The Korean situation remained substantially unimproved throughout 1949. The U.N. Commission on Korea, established by the general assembly to replace the Temporary Commission on Korea, held its first open meeting in Seoul on Feb. 12, 1949. The commission established two subcommittees, one to make contact with North Korea and the other to consult with the government of (South) Korea. In June the commission established another subcommittee to examine and report on the withdrawal of the remaining United States occupation forces. The last embarkations of U.S. troops occurred on June 29. The commission, through the secretary-general, asked the government of the Soviet Union to allow observance of the withdrawal of soviet troops from northern Korea. No answer was received either from officials in northern Korea or from the government of the Soviet Union in response to the commission's request to facilitate unification between north and south or to observe the withdrawal of troops. The commission, in a resolution adopted July 27, declared that the United States government and its commanding general no longer had any control over Korean security forces. A commission report adopted on July 28 set forth five main conclusions: (1) that propaganda and hostile activity between the two parts of Korea made unification remote; (2) that opposition of the Soviet Union to the commission and its objectives made a substantial degree of unification impossible; (3) that the differences between the Soviet Union and the United States remained one of the underlying factors in preventing unification; (4) that the Korean government should be allowed a broader political base; and (5) that the situation in Korea had not improved and that the commission had been unable to facilitate reaching the objectives of the general assembly. The general assembly on Oct. 21 voted to continue the United Nations Commission on Korea in being, rejecting a proposal by the Soviet Union to terminate the commission. The assembly widened the competence of the commission, giving it explicit instructions to be on guard against the outbreak of civil war in Korea. (*See* also KOREA.)

The Palestine situation remained one of continuous concern throughout the year. Primarily through the efforts of Acting Mediator Ralph J. Bunche, armistice agreements between Arabs and Jews were concluded early in the year. On Jan. 6 a cease-fire agreement between Israel and Egypt was signed, followed on Feb. 24 by an armistice agreement such as the Security council had requested in its resolutions of Nov. 4 and 16, 1948. On March 11 a cease-fire agreement between Israel and Trans-Jordan was signed. Armistice agreements between Lebanon and Israel and between Trans-Jordan and Israel were signed on March 23 and April 3, respectively. Negotiations between Israel and Syria began on April 5 and culminated in agreement on July 20, thus bringing hostilities in Palestine to an end. Bunche's final report was taken up by the Security council on Aug. 4. On Aug. 11 the council adopted a resolution declaring that the one-year truce had been superseded by the armistice agreements, relieving the acting mediator of further responsibility, reaffirming its unconditional cease-fire order and providing a nucleus of observer personnel.

The Palestine Conciliation commission, established by the general assembly on Dec. 11, 1948, convened in Geneva on Jan. 17, 1949, and established formal headquarters in Jerusalem on Jan. 24. The commission began discussions with Israel and the Arab countries in February. The commission later invited all the governments and delegations to Lausanne, Switzerland. This invitation was accepted, and the first meeting was held on April 27. It soon became obvious that deep-seated differences existed. The Israeli government was pressing for territorial negotiations, while the Arab governments insisted that negotia-

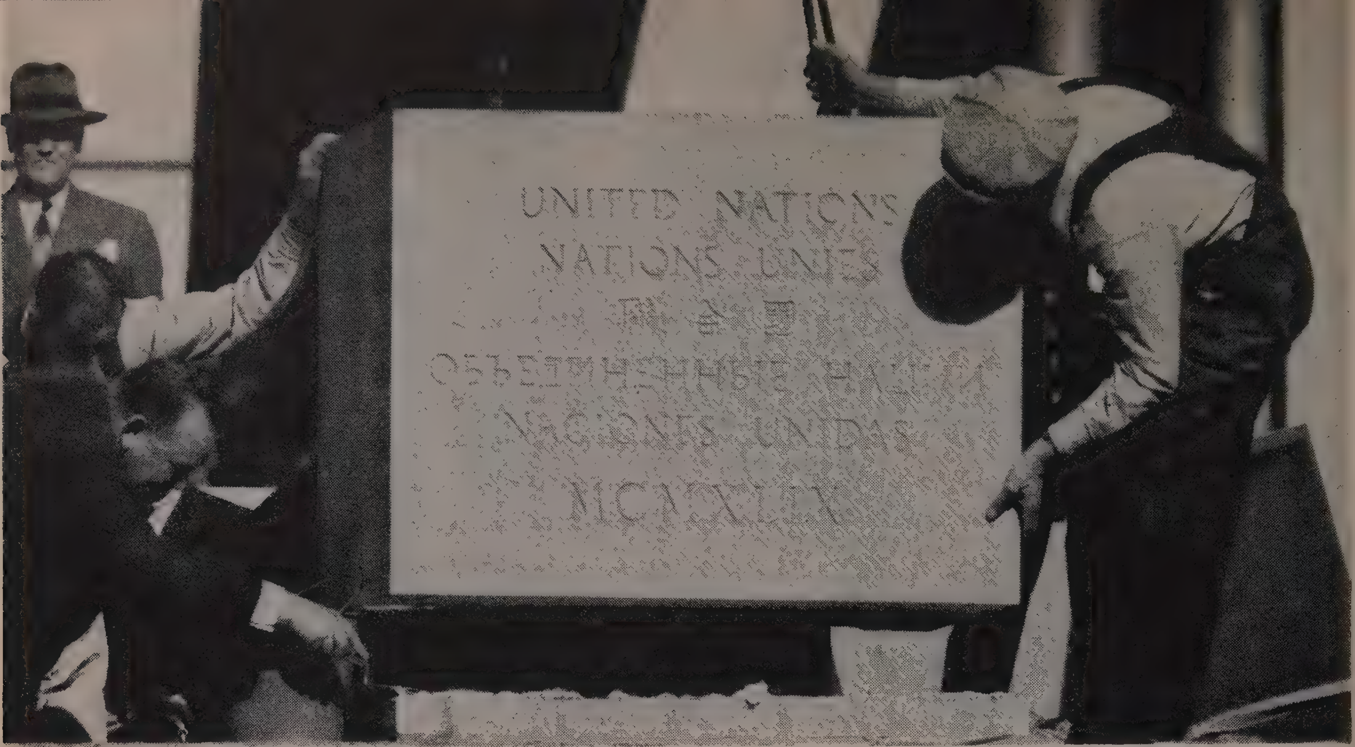
U.N.E.S.C.O.'s first simple clinic in Haiti, where about 200 people daily came for medical care in 1949, part of a U.N. pilot project in fundamental education. Haiti was selected because of its gross overpopulation and low level of literacy

tions regarding refugees should come first. The commission eventually set up an Economic Survey mission to aid the governments in overcoming economic dislocations. After a six-month study of the problem, the conciliation commission transmitted its recommendations to the general assembly on Sept. 1. These recommendations provided for the division of Jerusalem into a Jewish and an Arab zone, with specified functions performed by an international regime consisting of a U.N. commissioner, a general council, an international tribunal and a mixed tribunal. Jerusalem was to be permanently demilitarized and neutralized. The general assembly, however, refused to accept this recommendation, returning to the plan contained in its resolution of Nov. 29, 1947. By resolution of Dec. 10, the assembly reaffirmed the two principles that the city of Jerusalem should be established as a separate body under an international regime and that the Trusteeship council should be designated as administering authority. The resolution requested the Trusteeship council to complete the preparation of the statute. Both Israel and Jordan, the two states in actual occupation of the city, announced their unalterable opposition to the plan. (*See* also ISRAEL; JORDAN; PALESTINE.)

The Berlin dispute, brought before the Security council in 1948, was settled during the year, though not directly under United Nations auspices. Negotiations were initiated by representatives of the interested powers to the U.N., and the agreement that was eventually reached was undoubtedly facilitated by the opportunity for contacts which the U.N. affords. The committee of financial experts, nominated by the six "neutral" members of the council, and which had been appointed on Dec. 1, 1948, submitted a lengthy and confidential report on Feb. 11, 1949. The report was not made public until a month later and was never taken up by the Security council. The deadlock over Berlin was broken through informal conversations between Jacob A. Malik (Soviet Union) and Philip C. Jessup (United States) with other powers brought into the conversations after the initial two-power talks. On May 4 agreement was reached on all questions of principle. The agreement provided for the lifting of all restrictions which had been imposed by soviet authorities on communications, transport and trade between Berlin and western Germany. (*See* also BERLIN.)

The situation in China was brought to the attention of the United Nations when the Chinese nationalist government requested the general assembly in its fourth session to determine that the Soviet Union had violated the Sino-Soviet Treaty of Friendship and Alliance of Aug. 14, 1945, and the charter of the United Nations by giving aid to the Communists. After extended discussion, during which the right of the Chinese nationalist representative to speak for China was challenged, the general assembly on Dec. 8 adopted resolutions setting forth certain basic principles to be regarded as binding upon members in their relations with China and referred the whole matter to the Interim committee for further study. (*See* also CHINA.)

The question of the observance by Bulgaria, Hungary and Rumania of human rights and fundamental freedom guaranteed in the treaties of peace with these countries was first raised before the general assembly in the second part of its third session in connection with the trials of ecclesiastical dignitaries. At the fourth session the allegations were extended to include Rumania. In April the general assembly, expressing "deep concern," decided to retain the matter on its agenda for the fourth session



TRYGVE LIE (left), levelling cement for the laying of the cornerstone of the permanent headquarters of the United Nations in New York city, Oct. 24, 1949. Beneath the cornerstone was a receptacle containing historic documents including a copy of the U.N. charter

and invited the states parties to the peace treaties to use the procedures there provided. The governments of Bulgaria, Hungary and Rumania denied the accusations made in notes submitted by the United States and the United Kingdom and refused to appoint representatives on the commissions provided for by the treaties. In its fourth session, the general assembly adopted a resolution requesting the International Court of Justice to give an advisory opinion on questions relating to the interpretation of the treaty provisions in dispute.

The question of the treatment of people of Indian origin in the Union of South Africa was considered for the third time by the general assembly in the second part of its third session. In spite of strong objection by the Union of South Africa that this was a matter essentially within the domestic jurisdiction of that country, the general assembly adopted a resolution inviting the governments of India and South Africa, with the participation of Pakistan, to undertake a round table conference on the basis of the assembly's 1946 resolution. (*See* also SOUTH AFRICA, THE UNION OF.)

With respect to the questions of the international control of atomic energy and the limitation and reduction of conventional armaments, the stalemate existing at the close of 1948 continued throughout 1949. The Atomic Energy commission held six meetings between Feb. 18 and May 25 and then decided to refer the general assembly resolution of Nov. 1948 to its working committee for further consideration. The working committee decided that there was no useful purpose in continuing discussions and that its work should be suspended until the six permanent members had found a basis for agreement. On Aug. 9 the six permanent members of the commission began a series of meetings which failed to produce agreement. The general assembly later asked that these meetings continue, and in its resolution it again endorsed the majority control plan. (*See* ATOMIC ENERGY.)

With respect to conventional armaments, the Soviet Union introduced a proposal in the Security council in February that the Commission for Conventional Armaments elaborate a plan for the reduction by one-third of the armaments and armed forces of the permanent members of the Security council by June 1, 1949. The United States representative asked that the general assembly's resolution of 1948 be referred to the commission for action. The soviet resolution was rejected, and the United States proposal accepted. The French delegate to the working committee of the commission introduced a working paper on May 26 which contained proposals and recommendations for the census and verification of conventional armaments and armed forces. The working committee adopted the proposal on July 18, and on Aug. 1 the commission adopted the plan. A French proposal in the Security council that the commission's plan be accepted was defeated by the negative vote of the Soviet Union. Full information on the action taken was sent to the general assembly. The general assembly approved the commission's recommendations and requested the Security council to continue its study of the problem through the commission.

Development of International Law.—Under article 23 of the charter, the general assembly is made responsible for the development of international law. The International Law commission, established by resolution of the general assembly of Dec. 1946 to assist in this work, met for the first time in 1949. It was in session at Lake Success from April 12 to June 9. The commission prepared and adopted a Draft Declaration on the Rights and Duties of States; it considered and adopted a procedure for the further study of the principles of international law recognized in the charter and judgment of the Nuernberg tribunal; it gave preliminary consideration to the establishment of an international criminal court; and it provisionally selected certain topics for codification, giving priority to the law of treaties, arbitral procedure and the régime of the high seas. The general assembly, after receiving the commission's report, adopted resolutions urging the commission to include the regime of territorial waters in its list of priority subjects for codification and transmitting to members for comment the Draft Declaration on the Rights and Duties of States.

The development of international law was also advanced by the adoption by the general assembly of rules governing the calling of international conferences by the Economic and Social council, by the work of the general assembly, the Economic and Social council and its commissions and the secretariat in preparing draft agreements on various topics for submission to members and by the increased frequency of use of the International Court of Justice, either for advisory opinions or judgments. (For further details, *see* INTERNATIONAL LAW.)

Economic and Social Co-operation.—The most significant achievement of the U.N. during 1949 in the economic field was the adoption of a comprehensive plan for technical assistance to underdeveloped areas along the lines of Pres. Harry S. Truman's Point Four program. During its eighth session the Economic and Social council adopted a resolution requesting the secretary-general to prepare for the ninth session of the council a comprehensive program of U.N. technical assistance. Accordingly the secretary-general, in co-operation with the chief administrative officers of the specialized agencies, submitted a report on measures already devised to promote economic development in underdeveloped areas. There was also submitted a report, the result of co-operative action by the secretariats of the United Nations and eight specialized agencies, on an expanded program of technical assistance. The report outlined the administrative organization of such a program and estimated the expense of the first two years at $35,800,000 and $50,000,000, respectively. The objectives of the program were set forth to include the achievement by underdeveloped countries of the material and social benefits of a sound, balanced economic development. During its ninth session the Economic and Social council approved a program substantially along the lines of the secretary-general's report, except that a smaller initial expenditure was envisaged. The council's recommendations were adopted by the general assembly in its fourth session. As finally approved, the plan provided for the calling of a technical assistance conference for the purpose of negotiating contributions to the expanded program. It authorized the secretary-general to set up a special account for technical assistance to which governments were invited to contribute. It provided for the administration of the program by a technical assistance board composed of the executive heads of the United Nations and the participating specialized agencies, operating under the general direction of a standing technical assistance committee of the Economic and Social council. The plan provided for the distribution of funds initially available and laid down basic principles to govern the administration of technical aid.

In the social and humanitarian field, the U.N. registered important achievements. Following the recommendation of the Economic and Social council, the general assembly in its fourth session adopted a Convention for the Suppression of Traffic in Persons and of the Exploitation of the Prostitution of Others. Again, following out a suggestion contained in a memorandum prepared by the secretary-general at the request of the council, the general assembly voted to establish as of Jan. 1, 1951, a High Commissioner's Office for Refugees. The assembly also called upon members to make needed contributions to the International Children's Emergency fund. On the question of freedom of information, the general assembly adopted a resolution requesting all members to grant freedom of access to news personnel to attend U.N. meetings. It voted to postpone to its next session consideration of the Draft Convention on Freedom of Information.

Other activities during the year included a request by the Economic and Social council that the International Labour organization undertake a survey of forced labour and measures for its abolition, the affirmation by the council of the importance of ensuring trade union rights, decisions by the Commission on Narcotic Drugs initiating the drafting of a new single convention to simplify and improve existing international instruments for the control of narcotic drugs and progress by the Commission on Human Rights in drafting an International Covenant of Human Rights.

Specialized Agencies.—The following specialized agencies were in operation or in progress of formation in 1949:

International Labour Organization (I.L.O.).—*See* separate article.

Food and Agriculture Organization (F.A.O.).—*See* FOOD SUPPLY OF THE WORLD.

International Monetary Fund.—*See* separate article.

International Bank for Reconstruction and Development.—*See* separate article.

International Civil Aviation Organization (I.C.A.O.).—*See* AVIATION, CIVIL.

International Refugee Organization (I.R.O.).—*See* REFUGEES.

International Trade Organization (I.T.O.).—*See* TARIFFS.

United Nations Educational, Scientific and Cultural Organization (U.N.E.S.C.O.).—The fourth general conference was held at Paris, Sept. 19 to Oct. 5. In preparation of the program for 1950 three criteria were followed: practical importance for the betterment of the masses, the possibility of associating prominent intellectual and professional workers with the organization and the possibility of obtaining rapid results. The work of the organization during 1949 included educational and scientific aid to states that suffered during the war, educational aid to refugees, fundamental education projects, seminars, technical assistance to underdeveloped areas, cultural co-operative programs and the development of the use of mass media.

World Health Organization (W.H.O.).—The second World Health assembly met in Rome, Italy, from June 13 to July 2. It approved a regular budget of $7,873,000 and a supplementary budget of $9,152,250 to be raised on a voluntary basis. The program adopted by the assembly provided for the expansion and intensification of the activities of the organization, acting both independently and in co-operation with other international bodies. It gave special attention to possibilities of technical assistance to underdeveloped areas.

In line with the organization's policy of regionalism, regional meetings were held at New Delhi, India, Geneva, Switzerland, and Lima, Peru, so that delegates of southeast Asia, of the eastern Mediterranean and of the Americas could discuss health problems of their particular regions. Among the programs initiated in 1949 were: the survey of ways and means to deal with tuberculosis in ten eastern Mediterranean countries as well as in South America; long-term malaria control in India, Pakistan and Iran; and the promotion of penicillin output in eastern Europe. Practical services included: the sending of a venereal disease control demonstration team to India; medical services for the Arab refugees; supplies for Afghanistan to control a typhus outbreak; iron lungs for Bombay to relieve a polio epidemic; and aid to Ecuador following a disastrous earthquake.

International Telecommunications Union (I.T.U.).—Carrying out the decisions of its plenipotentiary conference at Atlantic City, N.J., in 1947, the International Telecommunication union during 1949 adapted its permanent organs to the structure decided upon at the conference and undertook through various means to bring some order into the use of radio frequencies.

Universal Postal Union (U.P.U.).—The Executive and Liaison committee held its 1949 session at Berne, Switzerland, from May 16 to May 25. F. Hess (Switzerland) was elected director of the bureau of the U.P.U. to succeed Alois Muri on Jan. 1, 1950.

World Meteorological Organization (W.M.O.).—The United States instrument of ratification of the convention establishing W.M.O. was deposited on May 4, 1949, the 17th to be deposited. The 30 ratifications required for the convention to enter into force had not been obtained by the end of the year.

Nonself-Governing Territories and Trusteeship Matters.—The fate of the Italian colonies was settled by the general assembly during 1949. During the second part of the third session, the general assembly attempted to find a solution, but without success. In the fourth session the recommendations of the First committee were adopted without change on Nov. 21. These recommendations called for the complete independence of Libya not later than Jan. 1, 1952, placed Italian Somaliland under trusteeship for ten years with Italy as the administering power and set up a commission to determine the wishes of the inhabitants of Eritrea and to report not later than June 1950. The assembly later approved Adrian Pelt, assistant secretary general for conferences and general services, as the U.N. commissioner to administer Libya until it would become independent on Jan. 1, 1952. On Dec. 9 the Trusteeship council established a special committee to draw up a trusteeship agreement for Italian Somaliland.

(*See* also ITALIAN COLONIAL EMPIRE.)

The question of the status of South-West Africa, formerly administered under League of Nations mandate by the Union of South Africa, was again brought before the general assembly as the result of the announcement by the Union government that it intended to establish a closer association between the Union and the former mandated territory and to discontinue sending reports to the U.N. on its administration. After extended consideration of the matter by its Fourth committee, the general assembly adopted two resolutions inviting the government of the Union of South Africa to resume the submission of reports and to comply with previous decisions of the general assembly, and requesting the International Court of Justice to give an opinion on the international status of South-West Africa. (*See* also SOUTH AFRICA, THE UNION OF.)

During 1949 information concerning over 60 nonself-governing territories was transmitted to the secretary-general and, after being summarized and analyzed by the Division of Information on Nonself-governing Territories, was studied by a special committee of the assembly. The committee met at Lake Success from Aug. 25 to Sept. 12, 1949. The report submitted by the special committee, including ten draft resolutions, led to vigorous debate in the fourth session of the general assembly. The position was taken by certain of the colonial powers that the permissive limits of the charter were being exceeded. Resolutions which the general assembly adopted recommended that members administering nonself-governing territories be invited to submit political information, that administering members give special attention to the improvement of education in territories under their control, that there be more effective co-operation with specialized international bodies in providing technical training facilities for natives, that the special committee be continued for three years and that the committee devote its attention each year to a special field, such as education. The representatives of Belgium, France and the United Kingdom strongly opposed certain of these resolutions and reserved their rights.

U.N. supervision of the administration of trust territories made substantial progress during the year. Following a new procedure suggested by the president of the council, reports to the council were presented by the special representatives of the administrative authorities, and members of the council submitted both written and oral questions. Following a general discussion of each report a Drafting Committee on Annual Reports, consisting of representatives of all council members, was appointed to prepare the council's report to the general assembly on the territory in question.

During its fourth and fifth sessions the Trusteeship council considered reports of the administering authorities on the administration of Western Samoa, the Cameroons (under both British and French administration), Togoland (under both British and French administration), Nauru, New Guinea and the Trust Territory of the Pacific Islands. The council also considered the report of its Visiting Mission to Trust Territories in East Africa and organized a Visiting Mission to Trust Territories in West Africa. Pursuant to a resolution adopted by the general assembly in its third session, it undertook the study of the question of administrative unions. A large number of petitions were considered, and some changes in petition procedure were adopted. In considering conditions in trust territories, the council was especially critical of the slow rate of political, economic and educational advancement and of the practice of combining trust territories with colonies in administrative unions.

The general assembly, on the basis of Trusteeship council reports and recommendations, adopted a series of resolutions reflecting a critical but constructive attitude toward the actual achievements of administering authorities. The assembly urged the more rapid advancement of trust territories toward self-government or independence, a greater participation of the indigenous population in various economic activities, greater progress in the elimination of uncivilized practices and in social improvement, improved educational facilities and the elimination of racial discrimination in education. The assembly also authorized further inquiry into the practice of administrative unions and recommended the use of the U.N. flag along with that of the administering authority. France and the United Kingdom reserved their positions on the methods of implementing these proposals. (For further information *see* TRUST TERRITORIES.)

General Administration and Finances.—The original 1950 budget estimates of the secretary-general called for gross expenditures of $44,314,398, which would have exceeded 1949 appropriations by more than $800,000. The Advisory Committee on Administrative and Budgetary Questions felt that a reduction of $1,786,750 could be made in the budget and so recommended to the assembly. The general assembly finally approved appropriations amounting to $49,641,773, including $8,000,000 for the international regime of Jerusalem. Miscellaneous income was estimated at $5,091,740.

In 1948, the general assembly had requested the Committee on Contributions to re-examine the existing scale of assessments. The committee concluded that since the world economic and financial situation could not be considered as having returned to normal, the time had not arrived for fixing a scale for a three-year period as contemplated in the general assembly's rules of procedure. The only adjustments proposed concerned the assessments of the United States and Sweden, which were reduced by 0.10% and 0.02% respectively.

The committee fixed the contribution of Israel, the only new member, at 0.12%.

United States.

The census bureau estimated that sometime after the middle of 1949 the population of the United States surpassed 150,000,000. Between April 1, 1940, and July 1, 1949, the population of the United States, excluding armed forces overseas, had increased by 12.9%. Eleven southeastern states in that period showed a net gain of 7.7%; Mississippi lost; Virginia and Florida gained substantially. California, Oregon and Washington showed a net gain of 54%. "In a most significant sense," according to one population expert, "the frontier has not yet disappeared, and new ones are being discovered in the Old South." The total area of continental United States is 3,022,387 sq.mi. (For population and area figures of the states, *see* the articles on the separate states. (*See* also BIRTH STATISTICS; CENSUS DATA, U.S.; CHURCH MEMBERSHIP; DEATH STATISTICS; IMMIGRATION AND EMIGRATION.)

Never had democracy been so clearly the basic interest of people of the U.S. as in 1949. Part of this interest was the result of the impact of totalitarianism from abroad. Part of it was the result of the criticism of the functioning of democracy, prevalent in the U.S. for a half century and brought to a head by pressing events at home as well as abroad. Part of it was due to the rise of defenders of democracy and the disagreement among themselves as to the means of preserving and improving upon the U.S. heritage. Defenders were legion. But most of all, this intense interest in democracy was expressed in the demonstration of democracy in action by customary full acceptance of the outcome of the presidential and congressional elections of 1948 and the appearance in Washington, D.C., in Jan. 1949 of a president with a program calling for definite advance in a program termed democratic. President Harry S. Truman's endorsement at the polls, and the election of a congress manifesting that same democratic outburst, seemed to indicate that in action—at home and abroad—the dominant political message would be the free will of a free people. The unexpected outcome of that election had seemed at the time to be the triumph of a man. But by the opening of the year 1949, events emphasized the outcome as an expression of the political power of many men and women.

President Truman's Program.—Upon taking office on Jan. 20, in an address broadcast by radio to every part of the nation, Pres. Harry S. Truman called for additional taxes to bring in an additional $4,000,000,000 of government revenue. Truman's program for labour included repeal of the Labor-Management (Taft-Hartley) act of 1947 and re-enactment of the Wagner act with improvements; reorganization of the department of labour; and the enactment of a minimum wage law requiring at least 75 cents an hour. For the farmer Truman asked for an improved national program to insure abundant agricultural production, parity of income for farmers through farm price supports and good utilization of land. To expand domestic markets for farm products and increase and stabilize foreign markets was a further aim of this program.

WHAT'S THE DIFFERENCE WHAT NATIONALITY HE IS—HE CAN PITCH!
JOHN Q PUBLIC
SHOEMAKER

"THE AMERICAN WAY," a cartoon by Vaughn Shoemaker of the *Chicago Daily News*, chosen in 1949 by the Freedom foundation as the cartoon which best promoted "the American way" during the year

To raise the standard of living of the U.S. people as a whole, the president asked for expansion of the social security program, with increase in the size of benefits and increased coverage against unemployment, old age, sickness and disability. To accomplish this, he proposed a system of prepaid medical insurance and remedy for the shortage of doctors, hospital facilities and nurses; federal financial aid to states to help them operate and maintain their school systems; the enactment of legislation for low-rent public housing, slum clearance, farm housing and housing research and encouragement of the building industry to produce lower priced housing by allocating materials in short supply and imposing price ceilings on such materials. Finally, the president called for enactment of the civil rights proposals he had made to the 80th congress.

The National Outlook.—The American people to whom the president addressed himself in Jan. 1949 comprised a nation in which belief in private enterprise was supported by private ownership of property in land and in industrial stocks; and by wide distribution of ownership of government bonds. It was a nation with a huge debt, estimated between $250,000,000,000 and $253,000,000,000, but with a rising national income which had reached $226,000,000,000 in 1948. Agricultural productivity was at an all-time high. While considerable loss of production had been caused in the previous year both indirectly and directly by strikes, especially in the coal mines and in east coast and west coast shipping and trucking, profits reaching an all-time high had continued to rise throughout 1948. Although income from most major sources had increased, the increase was offset by increase in consumer prices. Thus, there was no real gain in income. The American people nevertheless began the year 1949 with an increase in personal savings, for consumption expenditures had increased less than income. A larger proportion of these savings than formerly was invested in housing, unincorporated business and in farms rather than in liquid assets. Business investment was continuing at a high level. An average of more than 59,000,000 civilians were at work in the nation. (*See* BUDGET, NATIONAL; DEBT, NATIONAL; INCOME AND PRODUCT, U.S.)

As the year advanced, alert citizens observed the pressures of soviet Russia upon its satellites in eastern Europe; the rebellion of the independent Communist Tito in Yugoslavia. They were aroused by the trial and imprisonment of Joseph Cardinal Mindszenty, Roman Catholic primate of Hungary, which heralded open conflict between communism and a world-wide church. The apparent hardening of the will to dominate, evident in the soviet conduct of the blockade in Berlin, led to a growing belief in strong measures by the United States. The bipartisan approach to foreign policy, although under attack from a number of outstanding political figures, was maintained by the titular leaders of both parties in preparing for a hot war in order to keep the "cold war" cold.

The North Atlantic treaty (*q.v.*) was ratified by the senate in a vote of 82–13 on July 21. Shortly afterward President Truman submitted his proposal for a military assistance program, which on Sept. 22 came to its crucial test in the senate and was passed by a vote of 55–24 pledging $1,314,010,000. By October, spending under the Marshall plan went over the $7,000,000,000 mark. Meanwhile, the lifting of the Berlin blockade and the signing of the Bonn constitution signalized the revival of western Germany.

The menace of communism as a revolutionary force in the world outside the United States was made more vividly evident

"BR-R-R!" a cartoon by Barrow of the *Omaha World-Herald* lampooning Maj. Gen. Harry H. Vaughan, military aide to Pres. Truman. Gen. Vaughan was summoned to testify before a senate investigating subcommittee about his connection with certain "five-percenters," who aided businessmen to secure government contracts in return for fees or other substantial favours, including deep-freeze machines

to Americans by the announcement of President Truman on Sept. 23, the day after passage of the Arms Aid bill, that an atomic explosion had taken place in the Soviet Union. This was followed by a nation-wide debate as to the possibility of need of reshaping all plans not only for defense but also for participation in an open alliance having an aggressive program of attack. The extreme views were less evident after a month of debate. On the whole, it seemed that the basic alignment had not been changed by the announcement of possession by the U.S.S.R. of the means of making atomic weapons. Although the effect of the announcement was to devalue the power of the United States in the emotional reaction of its people, yet a new adaptation was made at the same time which seemed to increase belief that a general war was not near. That the U.S.S.R. had been contained in eastern Europe came to be generally acknowledged in the autumn.

Problems at Home.—Uneasiness caused by the menace of communism abroad was increased by the evidences of communism at home, shown notably in the trial of 11 Communist party leaders in the United States district court in New York city. This trial ended on Oct. 14, with a verdict of guilty of secretly teaching and advocating, on orders from Moscow, the overthrow and destruction of the government of the United States by force and violence. Although the defendants were conceded by the government an arguable point on appeal under the free speech amendment, the nine-month-long, carefully handled trial had presented overwhelming testimony to the incompatibility of Communist party activities with U.S. ideals.

The verdict in this case helped to resolve in the public mind the confusion caused by other trials, in particular the trials of Alger Hiss, former officer of the state department, accused by a confessed former Communist, Whittaker Chambers, of passing to soviet agents confidential state department documents. Because of the confidence in Hiss expressed by a number of men prominent in public life, these trials, more than spanning the year, were sensational and deeply disturbing to the public. In the public mind these trials were allied in purpose with the continued investigations of government employees suspected of disloyalty, the renewed attempt to deport Harry Bridges, leader of the International Longshoremen's union, through prosecution for perjury in denying that he was a Communist at the time he won U.S. citizenship, and the discharge of three faculty members from the state University of Washington, Seattle, on the basis of Communist convictions. (*See* also CIVIL LIBERTIES.)

The charge of Sen. Bourke Hickenlooper that Chairman David

Table I.—*Major Legislation Passed by U.S. Congress in 1949*

Act	House Vote	Senate Vote	Date of Enactment
Presidential Pay act (Increased president's salary to $100,000 a year and authorized total expense allowance of $90,000; increased salaries of vice-president and speaker of the house to $30,000)	Passed by voice vote	68 9 Yeas: D. 42, R. 26 Nays: D. 0, R. 9	Signed Jan. 19
Housing and Rent act of 1949 (Rent control extension to June 30, 1950. Authorized decontrol by states and municipalities; directed Federal Housing expediter to fix rents so that they would return a "fair net operating income")	263–143 Yeas: D. 196, R. 66, A.L. 1 Nays: D. 48, R. 95	78–11 Yeas: D. 52, R. 26 Nays: D. 0, R. 11	Signed March 30
Economic Cooperation act amendment, 1949 (Authorized appropriation of $5,430,000,000 for European Recovery program in period April 1, 1949–June 30, 1950)	Passed by voice vote	Passed by voice vote	Signed April 19
Reorganization Act of 1949 (Provided for submission of reorganization plans to congress by president, to take effect in 60 continuous-session days unless rejected by either house)	Passed by voice vote	Passed by voice vote	Signed June 20
Housing act of 1949 (Authorized long-range public housing, slum clearance and rural housing aid program)	227–186 Yeas: D. 192, R. 34, A.L. 1 Nays: D. 55, R. 131	57–13 Yeas: D. 33, R. 24 Nays: D. 2, R. 11	Signed July 15
Overtime-on-Overtime act (Eliminated extra pay for overtime as part of regular rate under Fair Labor Standards act) . . .	207–52 Yeas: 207 Nays: 52	Passed by voice vote	Signed July 20
North Atlantic treaty (Joined the U.S. in 20-year alliance with Canada, Great Britain and nine western European nations)		82–13 Yeas: D. 50, R. 32 Nays: D. 2, R. 11	Instrument of ratification signed July 25
National Security act amendments of 1949 (Placed defense establishment under executive control of secretary of defense; created post of chairman of joint chiefs of staff to co-ordinate work of that body)	356–7 Yeas: D. 216, R. 140 Nays: D. 2, R. 4, A.L. 1	Passed by voice vote	Signed Aug. 10
Trade Agreements Extension act of 1949 (Authorized the president (to June 12, 1951) to adjust U.S. tariffs in exchange for similar concessions by other nations)	319–69 Yeas: D. 234, R. 84, A.L. 1 Nays: D. 6, R. 63	62–19 Yeas: D. 47, R. 15 Nays: D. 1, R. 18	Signed Sept. 26
Mutual Defense Assistance Act of 1949 (Authorized appropriation of $1,314,010,000 for arms for North Atlantic pact members, and for Greece, Turkey, China, South Korea, Iran and the Philippines)	224–109 Yeas: D. 173, R. 51 Nays: D. 24, R. 84, A.L. 1	Passed by voice vote	Signed Oct. 6
Career Compensation act of 1949 (Provided increased pay and allowances for all members of the uniformed forces and reserve components thereof)	Passed by voice vote	Passed by voice vote	Signed Oct. 12
Government Officials Pay act (Raised salaries of cabinet members, other key officials and heads of executive agencies)	Passed by voice vote	52–14 Yeas: D. 37, R. 15 Nays: D. 0, R. 14	Signed Oct. 15
Fair Labor Standards amendments of 1949 (Raised legal minimum wage from 40 to 75 cents per hour; reduced coverage slightly)	131–19 Yeas: 131 Nays: 19	Passed by voice vote	Signed Oct. 26
Agriculture act of 1949 (Established long-range flexible price support program for farm commodities; assured high prices for six basic commodities in four-year transitory period). . . .	175–34 Yeas: 175 Nays: 34	46–7 Yeas: D. 27, R. 19 Nays: D. 0, R. 7	Signed Oct. 31
Classification act of 1949 (Provided pay increases for all classified federal employees and simplified compensation schedules)	Passed by voice vote	Passed by voice vote	Signed Oct. 28

Lilienthal of the Atomic Energy commission was guilty of "incredible mismanagement" produced long and exhaustive hearings before a joint congressional committee. At the close, the chairman was exonerated by a majority vote, but it was partisan in the continuance of doubt—either on political or practical grounds—on the part of Republican members. (*See* also ATOMIC ENERGY.)

The problems at home, quite apart from dealing with Communists in the United States, emphasized the fact that every domestic problem was in part a foreign problem. The pressure of organized labour for increased social security, the expansion of executive powers in the government, the increase of government controls—each of these focussed attention upon cost of government and upon taxation of citizens. There was no hope of reducing or of balancing a budget with such internal demands accompanying the steady increase of costs of defense and of carrying out the Marshall plan.

American Problems Abroad.—Close observers were sobered by the implications of the British devaluation of the pound sterling following the month-long negotiations in Washington in early autumn. The whole matter of world trade appeared again to be part of any stabilization of the world's uncertain economic situation. And this drove the argument as to world responsibility back into domestic politics. Upon this issue the party in power was prepared to take aggressive action, and won wide support from Republicans as well. It was surrender on the domestic front to an accomplished fact in international relations.

By the end of the year, the clearing union proposed by the Economic Cooperation administration (Marshall plan) was thought to be within sight, and some U.S. experts predicted that its realization would be a long step toward the convertibility of currencies. It was also thought that such a union might provide a practicable means of enabling Britain to go much further toward the "integration of her economy with those of the continent than has so far seemed to her to be possible or desirable." (*See* also EUROPEAN RECOVERY PROGRAM; ORGANIZATION FOR EUROPEAN ECONOMIC COOPERATION.)

The president, at the beginning of the year, had called for a "bold new" policy in undeveloped areas of the world, but little progress was made even with reference to Latin American countries. In the far east the year provided a record of retreat from former declarations, a defeat of U.S. interests and a loss of U.S. prestige. Whatever the explanation of the downfall of Chiang Kai-shek, it was clear that in the triumph of revolutionary forces under Communist leadership the United States had not only lost its favoured position in China, but also appeared to be weakening in its belief in its destiny to aid free people in the far east.

Domestic Politics.—The conflicts between president and congress as to specific measures resulted in a stalemate when congress adjourned in the autumn. This of course is not an unusual condition in United States politics. It was clear, however, despite attacks upon his appointees, opposition to his civil rights program and his call for increased taxes and criticism of his vacillating policies at critical moments, that the president ended the year in a stronger position on domestic issues than at the opening of congress. Both parties, as represented in congress, were seriously divided on every major issue. The Democratic party did not have a dependable majority. The southern Democratic revolt was stronger at the close than at the beginning. The president had made no major overtures at reconciliation and was still pressing his program of civil rights when congress adjourned.

Temporary attention was given certain local elections, although for the most part elections of the year were not significant. An exception was the defeat of John Foster Dulles in the race for a seat in the United States senate. New York's choice of Herbert Lehman, who had the active support of President Truman, seemed to some to indicate that the Fair Deal had succeeded the New Deal in the minds of the majority of the voters. Although Dulles had made a campaign of definite criticism of the policies of the Democrats, it did not seem to some observers probable that the campaign was a fair forerunner either of the elections of 1950 or of 1952. The small size of the total vote (4,928,646) and the unusual character of New York's floating vote supported this conclusion.

AIR VIEW of the inaugural parade for Pres. Truman and Vice-Pres. Barkley in Washington, D.C., Jan. 20, 1949. The presidential party is shown leaving the Capitol plaza surrounded by honour guards

As the year closed, gubernatorial aspirants for the elections of 1950 were much in discussion, notably in California, where, denouncing the two-party election of the incumbent Gov. Earl Warren, James Roosevelt opened a campaign for governor by outlining a program for a welfare state that was suggestive of the New Deal in its earlier phases and by committing himself to proposals that were reminiscent of the more extreme programs of the 1930s. (*See* also ELECTIONS.)

Discussion continued on the theme of so-called outworn political alignment, that is, Republican versus Democrat. The composition of party membership in the congress emphasized the divisions on party program; within the Democratic membership were wide divergences of belief, notably on the civil rights program and on other domestic proposals; within the Republican membership there was greater agreement on a domestic program, but none whatever on either temporary or fundamental questions in foreign relations. Consequently major legislation, when enacted, was by bipartisan vote, notably on the North Atlantic treaty, military aid to Europe, continuance of the

"HEY, FAT, YOU'RE NEXT," a cartoon by Pratt of the McClatchy Newspapers of California, published in 1949

Marshall plan for European recovery, and extension of reciprocal trade agreements. Nevertheless, when the party issue was drawn between candidates of the two parties, in elections before the people, the party lines tightened, notably in the New York senatorial election.

There was every indication as the year closed that the various divisions in the congress reflected actual divisions in the electorate and that, barring dramatic realignment caused by events beyond the borders of the country, the fundamental differences between the two great parties were to be more marked than at any time since 1932. Third parties were as unimportant in public thinking as at any time since the opening of the century. (*See* also DEMOCRATIC PARTY; REPUBLICAN PARTY.)

Congress.—A hard working congress in an unusually extended session, due to conflict with a determined president, accomplished five important objectives: (1) reaffirmation, by financial support amounting to more than $5,000,000,000 for the second year of the Marshall plan for economic aid to Europe; (2) ratification of the North Atlantic Security pact; (3) passage of the Reciprocal Trade Agreements act, restoring the full powers of the president to negotiate reciprocal trade agreements on the pattern successfully pursued by former Secretary of State Cordell Hull; (4) adoption of the National Housing act, a long range measure to obtain low rental public housing and slum clearance; (5) passage of a series of reorganization acts following the recommendations of the Commission on Organization of the Executive Branch of the Government (Hoover commission).

President Truman signed 792 measures enacted into law by his signature and vetoed 32 measures, including two by pocket veto. Congress spent about $34,400,000,000, having pared about $1,700,000,000 from the president's budget of a little more than $36,000,000,000.

Failure to act on the president's civil rights program appeared as the reflection of a southern Democratic-Republican coalition in this entire field of legislation. Failure to enact a new labour bill correcting some of the faults which experience had demonstrated in the existing Taft-Hartley act was attributable to the pressure of the administration for a dramatic repeal of the latter. The fact that congress failed to vote $4,000,000,000 in taxes called for by the president and yet voted a budget in which prospective expenditures would exceed prospective revenue, possibly by as much as $5,000,000,000, reaffirmed national deficit financing. The passage of a new farm bill which fixed farm-price supports hard and fast at the highest level ever reached in the history of this kind of legislation placed upon congress responsibility for greatly increasing the taxpayers' burden, placing the consumer at a disadvantage and disregarding the pledges given by both political parties in favour of a system of flexible supports. Minimum wage rates in the nation were raised by the 81st congress from 40 to 75 cents an hour. Legislation for federal subsidies to schools, much publicized in the exchange of views between Francis Cardinal Spellman and Mrs. Franklin D. Roosevelt; for creation of a department of public welfare; for compulsory national health insurance; and for the extension of social security—these, as well as the civil rights program, failed of passage.

Despite the vigour of the president's leadership congress showed throughout the year, and increasingly toward the end, an unusual independence. On Dec. 8 Sen. Harry F. Byrd (D.) of Virginia, long an opponent of the administration, issued his opposition budget which promised to be used as the weapon against the president and his advisers in finance.

Labour.—During a year of recurring crises in the country's international relations, organized labour continued its aggressive program for security and for increased wages. Outstanding was the campaign for the fourth round of wage increases since the end of the war. By the middle of July a stalemate was complete between the steelworkers and the steel companies. The federal fact-finding board on Sept. 10 recommended no increase in wages, but the payment of pensions and social insurance by management. This the unions accepted and management rejected. The steel workers went on strike in October, and by the end of the month won. The contracts which were then signed pointed the way for all industry on this issue.

In common with the mood of the rest of the nation, organized labour was engaged throughout the year in expelling known Communists and in reducing the powers of more radical unions. In December representatives of both the American Federation of Labor and the Congress of Industrial Organizations co-operated in founding an International Confederation of Free Trade Unions in London, Eng.

The rise of the power of organized labour in politics had never been more evident than in the year 1949. Its importance was clearly recognized by the president in his inaugural speech and again in his message to congress. The programs of both the American Federation of Labor and the Congress of Industrial Organizations for wage increases and for pension provisions were constantly in public discussion. The role of John L. Lewis, in his conferences on strikes and in his public utterances, was dramatically presented in newspaper and radio comment. The public was aware that no question in domestic legislation and no issue in politics was unaffected by the attitude or anticipated attitude of labour. Election figures indicated that the political power of labour in votes far transcended the membership in organized labour unions. In the congress the issue was drawn upon proposals, first, to repeal the Taft-Hartley law, and second, to amend it to the extent of making it workable. The heart of the discussion was on the injunction clause. The senate under the leadership of Sen. Robert A. Taft by a close vote modified the act, but the bill was buried in the house and came to no vote. The administration maintained its position demanding repeal and re-enactment of the Wagner act. The full intent of the leaders of organized labour was seen at the end of the year in the issuance of the call by the American Federation of Labor on its members to express their sentiments at the polls in punishing 107 "enemies of labour" in congress, almost all of them Republican. (*See* also LABOUR UNIONS; STRIKES.)

The Economic Situation at Home.—The economic decline experienced during the first half of the year was, in the view of leading business and labour leaders, only the natural and inevitable readjustment from the inflationary levels of 1948. According to the secretary of commerce, businessmen during the year had urged tax relief, in particular the elimination or reduction of wartime excise taxes, and measures to permit small businesses to retain a larger share of earnings as working capital. Increased sources of loans to meet the credit needs of small business were also called for.

The year ended with an estimated national income of $222,000,000,000, the small reduction of $4,000,000,000 from the 1948 level apparently reflecting price declines accompanying an increase in total production supply. Total salaries and wages were higher in 1949 than in 1948, both in dollars and in purchasing power. Earnings of corporations and of farm proprietors were lower, however, than in the record year of 1948. Declining prices of farm products, less urgent demand in foreign countries and heavy production following the bumper crops of 1948 accounted for the drop in farm income. Industrial production in general was moderately below 1948, but the automobile industry's output rose to a record of 6,000,000 cars and trucks. Construction, both public and private, topped the 1948 record by 3%.

Employment in 1949 averaged 58,500,000, or 2% less than in 1948. Unemployment, in a rising work force, rose to about 3,500,000, as compared with the minimum of 2,000,000 unemployed the previous year. In 1949 business discontinuances exceeded business beginnings by a small number for the first time since the end of the war.

Despite the seemingly favourable economic situation of the nation on the whole, there was much concern among businessmen, as well as in the Republican opposition, over the tendency of the government to interfere in the economy, whether by government spending and deficit financing in time of prosperity and theoretical peace, or by pledging high production prices and low consumer costs as in the Brannan farm plan. (*See* also BUSINESS REVIEW; EMPLOYMENT; INCOME AND PRODUCT, U.S.; PRICES.)

Foreign Policies.—The drain upon the U.S. economy for aid to western Europe brought results that, becoming unmistakably evident during the year, were heartening. The apparent success of the Marshall plan in stimulating economic recovery through restoring production exceeded expectation. It is significant that, while Marshall plan aid was helping to carry the continent through the difficulties of the postwar period, European unity was under discussion in late summer in the Council of Europe, the continent's first experimental parliament. (*See* EUROPEAN UNION.) Difficulties in the way of either economic or political unity in western Europe appeared formidable. Yet, as Winston Churchill said, "alternative to the success of a united Europe is a complete breakdown of European recovery after the American aid comes to an end; and that would be attended by a widespread misery, which is the soil from which communism springs and the sad diet on which it feeds." According to Paul G. Hoffman, Economic Cooperation administrator, "Unless western Europe with our help becomes economically healthy, politically stable and militarily strong and thus avoids falling into the Soviet orbit, the United States—even though we may avoid war

GEN. LUCIUS D. CLAY addressing a nation-wide radio audience on his return to the U.S. in May 1949, after more than two years of service as U.S. military governor in Germany. Immediately behind him are Secretary of State Dean Acheson (left) and Pres. Truman

—will have to become a garrison state."

By the end of the year the integration of European economy was greatly advanced by the prospect of a clearing union, as previously noted. "Integration" Hoffman defined as "the formation of a single large market within which quantitative restrictions on the movement of goods, monetary barriers to the flow of payments and, eventually, all tariffs are permanently swept away."

Meanwhile, as the U.S.S.R. organized a satellite state in eastern Germany and as the Bonn government in western Germany gave reality, in the minds of western Europeans, to the prospect of a revived German nation, new obstacles to European unity appeared. Although the soviet sphere of influence had not widened in Europe in 1949; had diminished in the case of Yugoslavia; and had lost power of persuasion everywhere west of the "iron curtain," yet the atomic explosion in the Soviet Union, the purges in the eastern European satellites of the U.S.S.R. and the prospect of a Germany rising to seek unity at any price were matters of absorbing concern to Americans, as well as to Europeans, in the last quarter of the year.

In 1949 the United States had been more active in shaping world decisions than at any time in its history except during war, and to most Americans it seemed that both in Europe and in Asia these activities were being carried on in a world of war. Only the western hemisphere appeared to be at peace. Although majority public opinion had reversed its former stand on foreign policy in assuming economic and sometimes political leadership in western Europe, China and the far east were little comprehended. Aid had been reluctantly withdrawn from China by the middle of the year. United States interest in China was renewed as the spread of soviet influence in China proved to be inevitable. At the opening of the year, the nationalists still held at least half of China, and Americans, recalling earlier Chinese civil wars, of which they knew little, and their own experience in the U.S. Civil War, from which they drew unjustified analogies, saw a stalemate and a compromise between Communists and nationalists. But the complete collapse of Chiang Kai-shek in December and the journey of the Communist Mao Tse-tung to Moscow a few days later brought about final disillusionment in the United States. (*See* also CHINA.)

International Politics.—Thus was confirmed the conclusion which had been made clearer month by month that in the world there were now the Big Two. It had been given dramatic setting by the meetings of the Security council of the United Nations, and the fourth session of the general assembly. The physical presence of the United Nations was emphasized in October by the laying of the cornerstone of a permanent structure for its residence in New York city. Whatever the limitations of the United Nations in its obvious failures to settle questions outside a narrow field, the meeting of the assembly once more in the United States provided an unusual arena for the war of public opinion or of governmental opinion, as the case may be, of the nations of the world. It furnished, moreover, the most practical means of communication between the east and the west, that is, between the historical western democracies and governments under the influence of the Soviet Union. Efforts to make the United Nations an effective agency for peace were subject to the continuing conflict between two systems of society jockeying for position. That this manoeuvring could take place within an institutional framework was nevertheless evidence of a significant advance in a world political institution. (*See* also UNITED NATIONS.)

THE UNITED STATES and its regional associations. Adapted from a series of maps in the *New York Times* behalf of world government, federal union and additions to the United Nations. The work was done by nonpolitical agencies, although there was widespread support among members of the congress and in various state legislatures. A number of state legislatures pressed resolutions calling for constitutional amendment to make U.S. participation in world government possible. In the autumn a resolution was introduced in the senate calling upon President Truman to summon a conference of nations who had signed the North Atlantic treaty to consider a federal union. Twenty-two senators supported this proposal but no vote was taken. Early in 1950 hearings were to be held upon this proposal. (E. E. R.)

Foreign Credits of the U.S. Government.—The outstanding indebtedness of other countries to the U.S. government rose by less than one-tenth in the 15 months ended Sept. 30, 1949, as foreign aid increasingly took the form of gifts and other grants instead of loans and other credits calling for repayment of principal with interest. Thus in the 15-month period disbursements on loans and other credit utilizations of $1,200,000,000 represented less than one-sixth of total foreign aid of $7,700,000,000.

The increase in outstanding credits that did occur was almost wholly due to loans extended by the Economic Cooperation administration under the European Recovery program. In fact, outstanding loans of the Export-Import bank actually declined because repayments exceeded disbursements in the 15-month period.

Unutilized commitments declined by over one-third in the same period to $582,000,000, a low point for a number of years. There were in addition unutilized authorizations of $1,076,000,000, mainly the uncommitted lending authority of the Export-Import bank. This would actually become available for specific purposes only to the extent that new applications met the standards of that bank or of other lending agencies.

Most of the lending activity in the period occurred between Oct. 1948 and March 1949 and there were practically no disbursements by the July–Sept. 1949 quarter. On the basis of available data for the last quarter of the year, it was probable that the situation as of the year-end was substantially the same as that shown in Table II.

Countries participating in the European Recovery program accounted for 85% of the outstanding indebtedness on Sept. 30, 1949. Only two countries, United Kingdom and France, together were responsible for the bulk of the ERP total.

About one-sixth of unutilized credit commitments represented those of the Economic Cooperation administration available for the use of ERP countries. Unutilized commitments of the Export-Import bank were one-third of the total, but very little more than one-tenth of these were designated for ERP countries.

Collections of principal and interest increased as compared with earlier years, to aggregate over $600,000,000 in the 15 months. This included a large repayment made by Canada in advance of the due date. On the other hand, reported defaults were inconsequential. Approximately two-thirds of total collections was reported by the Export-Import bank. A substantial part of the total debt, including almost all of that owed by the United Kingdom, did not call for any repayments in this period. By 1952, however, the entire United Kingdom debt, as well as almost all others, would require regular payments of principal and interest, and annual debt service would exceed $500,000,000. According to the terms of some credit agreements certain payments could be deferred under stated conditions.

The most notable development in the year was the almost complete utilization of the $1,000,000,000 authorized by congress in April 1948 for loans and guarantees in the first year of

Table II.—*Foreign Credits of the U.S. Government—by Agency and by Country, as of Sept. 30, 1949*

	Total	Outstanding	Unutilized commitments and authorizations

the European Recovery program. In Oct. 1949 congress authorized an additional $150,000,000 for loans in the second year of the program, representing a much smaller proportion of the total amount authorized for aid. Also significant, though less sizable in amount, were the initial disbursement of $20,000,000 by the department of the army from the revolving fund of $150,000,000 for financing the purchase of natural fibres and their processing in occupied areas, and of $18,000,000 by the state department of the total of $65,000,000 interest-free loan for financing the United Nations headquarters in New York city. Other programs, such as the credit sales of surplus property, including merchant ships, were virtually brought to a close within the year. (R. C. Pe.)

"RIDERLESS HORSE," a cartoon by Illingworth of the *Daily Mail* (London), published in Feb. 1949. The North Atlantic treaty was not ratified by the U.S. senate until July 21, 1949

Education.—*See* the articles Education; Universities and Colleges.

Defense.—For information about the armed forces of the United States in 1949, *see* Armies of the World; Aviation, Military; Coast Guard, U.S.; Marine Corps, U.S.; National Guard; Navies of the World.

Foreign Trade.—*See* the articles Business Review; Export-Import Bank of Washington; International Bank for Reconstruction and Development; International Monetary Fund; International Trade; Tariffs.

Uranium. The major sources of supply of uranium in the past were the Belgian Congo and Canada, with small amounts from the United States, Czechoslovakia and Portugal. With the development of the atomic bomb there developed a new incentive for a world-wide search for uranium ores. In such a widespread program, favourable results could be expected in only a relatively few locations, but no definite information was available during 1949 on the findings. A number of new locations were reported, but for security reasons little detailed information was made public.

Previous to the discovery of the rich ores of the Belgian Congo, small amounts of radium ores were mined in the United States, and from these uranium was recovered as a by-product. The Colorado plateau area of Colorado, Utah and Arizona had supplied moderate tonnages of low grade vanadium-uranium-radium ores since the early 1930s. Prospecting and new development were active in this area, and late in 1949 it was reported that there were about 300 mines in operation, employing 1,000–1,200 miners and supplying ore to six treatment plants. Other areas of Arizona also made marked progress, and at midyear of 1949 ore production was estimated at 200 tons per day.

To stimulate the prospecting program in the United States, a price of $3.50 per pound of uranium oxide was guaranteed, supplemented by a bonus of $10,000 to any operator who delivered as much as 20 tons of concentrates of at least 20% of uranium oxide from any single claim not previously operated. (*See* also ATOMIC ENERGY; CHEMISTRY; PHYSICS.)

(G. A. Ro.)

Urology. Elimination or control of systemic sources of the male sex hormone was found to be the best method of treating carcinoma of the prostate gland. The two methods which had been employed for this purpose were castration and the administration of estrogenic substances. A review of a large number of cases in which prostatic cancer was treated by these methods over a period of more than five years showed that the two methods were of equal therapeutic value; it also showed that such treatment was palliative only and not curative. Estrogenic treatment was followed by most clinicians, a somewhat larger dosage being used than was originally employed.

Although radical perineal prostatectomy for cancer of the prostate gland had been advocated by a number of urologic surgeons, only during 1949 was a large number of patients followed over a postoperative period long enough to give the operation statistical appraisal. Judging from a report from the records of the Johns Hopkins hospital, this procedure had definite clinical advantages over other methods of treatment as far as survival was concerned. According to the report, more than 51% of the patients with tumours believed to be completely confined to the prostate on rectal examination lived five years or longer without recurrence and without castration or estrogen. Among the patients who underwent operation from 10 to 27 years previously, 28% were living still and without demonstrable cancer. No reports of any other method of treatment had equalled these statistics. Unfortunately, however, in only 11% of the cases had cancer of the prostate gland observed clinically been found amenable to radical perineal prostatectomy.

Successful transplantation of human prostatic cancer into guinea pigs through 16 successive generations was reported. Animals susceptible to cancer were not selected. Transplantation of prostatic cancer to the castrated male animal was unsuccessful, and testicular androgen was necessary to initiate growth.

The availability of a chemical test for measuring 17-ketosteroids in the urine stimulated more general interest and research in the field of urinary hormonal assays. Tests for measuring estrogens and the glycogenic adrenal corticoids gave promise of more widespread clinical acceptance.

Experience with isotonic solutions such as 5% solution of glucose for irrigation of the bladder during transurethral operations on the prostate gland showed that haemolysis could be prevented. Deaths following transurethral resection may be due to haemolysis with an oliguric syndrome, and the mortality rate had been materially lowered by substituting glucose solutions as an irrigating agent in the place of sterile water.

Experience with several new antibiotic solutions, including aureomycin and chloromycetin, showed their comparative merit in combating infections of the urinary tract. Aureomycin was found to be efficacious in combating certain types of bacteria found with urinary infection which had resisted other antibiotics and sulfonamides. Included among the bacteria in this group were *Escherichia coli, Aerobacter aerogenes, Proteus vulgaris* and certain species of staphylococcis, but not pseudomonas. Although aureomycin may cause moderate gastro-intestinal upset, it has the advantages that it can be administered orally and is not toxic in the sense of causing serious anaphylactic reaction or systemic damage such as those occurring with other antibiotics. Chloromycetin was found to possess antibacterial properties similar to those of aureomycin and also to cause minimal systemic reaction. By changing the methods of administering sulfonamides the incidence of sensitization may be materially reduced. This was achieved by combining several different sulfonamide drugs with minimal dosage of each drug.

Experience in the treatment of gonococcal infection showed that best results were attained by one or two intramuscular injections of 300,000 units of penicillin G in sesame oil. (*See* also VENEREAL DISEASES.)

Uruguay. A republic in southeastern South America, Uruguay is bounded on the north by Brazil, on the south by the Río de la Plata, on the east by the Atlantic ocean and on the west by Argentina. It is the smallest country in South America with an area of 72,172 sq.mi. It has a population of 2,330,000 (mid-1948 est.), mostly of European extraction. Montevideo, the capital, has 850,000 inhabitants (1947 est.). Other leading cities are Paysandú (50,000); Salto (48,000); Mercedes (33,000); and Minas (32,000). Religion: Christian, mostly Roman Catholic. President in 1949: Luis Batlle Berres.

History.—During 1949 Uruguayan relations with Argentina remained strained and the dollar shortage continued. At the inter-American regional conference of the International Labour organization held in Montevideo April 25 to May 7, President Batlle Berres in his opening address said that social justice without civil liberty was a lie and, what was serious, it was a dangerous lie. Diplomatic circles considered this an allusion to Pres. Juan D. Perón of Argentina and his governmental system. A resolution was adopted citing violation of workers' rights in Peru and Venezuela.

Relations with Argentina were strained further when in mid-June a small bomb was thrown into the Uruguayan embassy in Buenos Aires. The Peronista newspaper *Democracia* criticized Uruguayan Ambassador Roberto MacEachen for his willingness to give refuge to Agustín Rodríguez Araya, who had been expelled from the Argentine chamber of deputies.

In May Antonio Richero, a Communist, was expelled from the chamber of deputies for insulting a member of the Brazilian cabinet, who was visiting Uruguay. In June Nilo R. Berchessi was appointed finance minister, thus ending a five-day cabinet crisis.

In August the Junta Americana de Defensa de la Democrácia, under the chairmanship of Juan Andrés Ramírez, and with former presidents Rómulo Gallegos of Venezuela and Eduardo Santos of Colombia among its members, was formed as a "rallying point for democratic forces in Latin America." Earlier, in conjunction with Guatemala, Uruguay asked the United Nations to investigate violations of human rights by the Venezuelan junta.

In May the government utility monopoly announced a $58,000,000 hydroelectric development program, and in October a loan for power development was concluded with the International Bank for Reconstruction and Development. Through the summer the peso declined steadily, 10% in June alone. Wool was withheld from the market in hopes of more favourable exchange rates, since the price had dropped 25%. In October, following Argentina's lead, the peso was devalued. The new buying rate was fixed at 1.519 pesos to the dollar and the selling rate at 1.90 to the dollar. Other rates for special trade items were established.

In July a three-month, $16,000,000 trade pact was signed with Italy. It provided exchanging animal products for Italian heavy manufactures. The United States was severely criticized because the U.S. army awarded an Argentine firm a contract for supplying canned meat to Europe when originally Uruguay had been the lowest bidder. The army explained that the Uruguayan firm could not meet all the requirements and, that under the new conditions, the Argentines were the lowest bidders.

(J. McAD.)

Education.—In 1947 there were 1,635 public schools with 192,804 pupils. Rural schools were attended by 52,000 students. University education is available at the University of Montevideo.

Finance.—The monetary unit is the peso, valued at $0.5263 U.S. currency, controlled rate, on Dec. 1, 1949. The budget for the fiscal year 1949 estimated revenue at 204,464,802 pesos and expenditure at 223,250,588 pesos. The funded public debt (Dec. 31, 1948) amounted to 760,200,000 pesos, of which 637,700,000 were internal and 122,500,000 external. Notes in circulation on Sept. 30, 1949, totalled 229,500,000 pesos. Bank deposits averaged 384,300,000 pesos in Sept. 1949; gold holdings of the Bank of the Republic totalled $161,000,000 on Aug. 31, 1949.

Trade and Communications.—Exports in 1948 totalled $178,955,000; imports were $201,458,000. Chief exports were wool (37%), meat (25%), linseed, linseed oil and linseed oil cake (13%) and hides and skins (12%). Chief imports were machinery and vehicles (28%), textile fibres and cloth (8%), petroleum and products (6%) and sugar (4%). The leading customers were the U.S. (28%), the United Kingdom (18%), Belgium (9%), the Netherlands (7%) and Italy (7%); the leading suppliers were the U.S. (34%), the United Kingdom (13%), Brazil (10%) and Argentina (8%).

Railways (1948) totalled 1,874 mi. The highway system (1948) comprised 26,000 mi., of which 3,051 mi. were paved. Automobiles numbered 50,100 on Dec. 31, 1947. According to *Lloyd's Register of Shipping*, the merchant marine had 43 steamers and motorships (100 tons or more) aggregating 63,062 gross tons on June 30, 1948. Air service was supplied by eight international air lines and two local companies in 1949. Telephones numbered 71,732 and radio sets about 230,000 on Dec. 31, 1947.

Agriculture.—Major crops in the crop year 1948–49 (in short tons) included wheat 571,323; linseed 128,700; oats 56,211; malt barley 18,770; ordinary barley 9,582.

Official estimates (May 1946) showed 6,834,000 cattle and 19,567,000 sheep. Wool exports in the year 1948–49 (Oct. 1–Sept. 30) totalled 118,237 bales (1947–48: 153,267 bales), of which 65,549 bales went to the U.S., 13,803 bales to Italy and 12,365 bales to western Germany. Meat exports in 1948 totalled 64,868 short tons, including 39,961 tons of frozen beef, 18,469 tons of canned meat and 3,733 tons of frozen mutton. In 1948, 22,833 short tons of cattle hides and 10,322 tons of sheepskins were exported.

Manufactures.—The estimated values added by manufacture (exclusive of the cost of raw materials) of the leading industrial products in 1947 were: food products 62,000,000 pesos; textiles 35,000,000 pesos; beverages 35,000,000 pesos; metal products 27,000,000 pesos; stone, sand, cement and clay products 16,000,000 pesos; and clothing 15,000,000 pesos. There are four *frigoríficos;* the three Montevideo *frigoríficos* treated 475,280 cattle, 406,570 sheep and 70,115 pigs in 1948. There were about 115 textile mills in 1948, with an estimated total capital of 105,000,000 pesos and employing about 15,000 workers. The cost-of-living index for Montevideo stood at 192 in Aug. 1949 (1937 = 100).

Mineral Production.—Activity is limited to the extraction of semiprecious stones (exports 1948: 78 short tons) and construction materials.

U.S.S.R.: *see* UNION OF SOVIET SOCIALIST REPUBLICS.

Utah. A Rocky Mountain state, admitted to the union in 1896, Utah is popularly known as the "Beehive state." Area:

84,916 sq.mi. (82,346 sq.mi. land, 2,570 sq.mi. water); pop.: (est. 1949) 682,000; (U.S. census 1940) 550,310. The rural nonfarm population was 150,645 in 1940, farm 94,352; urban 305,493, with the following origins: white (native) 510,662; (foreign-born) 32,298; Negro (native) 1,225; (foreign-born) 10. Capital: Salt Lake City (pop. est. 1948, 210,000). Other principal cities with 1948 est. pop.: Ogden (63,000), Provo (29,000), and Logan (16,000). In 1948, the Mormon Church gave its membership as 1,016,170, and of that number 484,890 were residents of Utah and 175,367 of Salt Lake City.

History.—The chief officers of Utah in 1949 were J. Bracken Lee, governor; Heber Bennion, Jr., secretary of state; Reese M. Reese, auditor; Ferrell H. Adams, treasurer; Clinton D. Vernon, attorney-general; E. Allen Bateman, superintendent of public instruction.

During 1949 the chief news event in Utah was the disastrous winter, during which storms and blizzards blocked highways, marooned motorists, caused deaths by freezing and snowslides, closed schools and destroyed many range livestock. The financial damage to stockmen and transportation companies ran into many millions of dollars.

The year was also marked by the fight of economy-minded Governor J. Bracken Lee to reduce expenditures in the state. The governor began to fulfill his campaign promises by vetoes of appropriations but the major check came when he slashed $3,800,000 out of a $52,256,000 general appropriations bill. This action resulted in the handing down of a number of legal opinions and a court case which invalidated some of the item vetoes. In a compromise the Republican governor and his Democratic officers and legislature agreed that the disputed amounts would not be spent, but this understanding did not cover a $20,000 item of the state department of education which was still a subject of dispute at the end of the year.

The year also marked definite progress in the development of the Colorado river basin. A 1948 agreement dividing the water among the five upper division states was finally ratified by the legislatures of the states and the congress of the United States and signed by the president. The United States reclamation bureau suggested an upper basin long-term storage plan which was tentatively approved by the interested states, and these same states reached an agreement on initial participating projects.

Education.—There were 151,465 children of school age in Utah in Oct. 1948. From July 1948 to July 1949 the average daily attendance at school was 136,943 out of an enrolment of 150,586. The total cost of education for the fiscal year July 1948–July 1949, was $38,491,957.61 of which $25,143,846.05 was for operating expenses. There were 4,570 teachers and 436 principals.

Social Insurance and Assistance, Public Welfare and Related Programs.—Total expenditures for public assistance during the fiscal year July 1948–July 1949 amounted to $12,740,103.45, an increase of $1,260,940.53 or 11% over the preceding year. The funds were distributed as follows: old-age assistance $6,065,073.13; aid to dependent children $4,154,579.70; aid to the blind $126,577.18; aid to unemployables $1,086,738.61; aid to employables $302,159.30; other assistance $477,601.76; and administration $527,373.77. The number of persons receiving public assistance rose from 25,750 as of June 1948 to 27,690 as of June 1949, an increase of 7.5%, and the average grant per person rose during the same period from $35.03 to $36.28.

The 1947 legislature fixed the amount of "budgetary needs" for recipients of public assistance at not to exceed (per month) $45 for a one-person case, $90 for a two-person case, $114 for a three-person case and $15 per person for each additional person beyond three in a case, with an over-all maximum of $175 for any case. By Nov. 1949 the budgetary needs had been adjusted to $50 (per month) for a one-person case, $85 for a two-person case, $114 for a three-person case and $15 per person for each additional person beyond three in a case, with an over-all maximum of $175 for any case.

Communications.—On July 1, 1949, there were 28,137.2 mi. of roads maintained in Utah of which 18,732.7 mi. were improved and 9,404.5 mi. were unimproved. Motor vehicle registration had reached 217,221 by Oct. 1, 1949, and registration receipts by June 30, 1949, were $2,847,709.42. Receipts from the motor fuel tax were $6,903,788.78. For the fiscal year ending June 30, 1949, state highway expenditures amounted to $11,320,844.21 of which $5,017,832.29 were federal co-operative grants. The state distributed $1,731,711.05 to cities and counties from motor-vehicle registration receipts for expenditure on local roads.

There were 60 bus companies operating in the state in July 1949 and the 9 railroads operating had a combined mileage of 2,116.37. The number of civil airports (excluding emergency air fields) recognized by the CAA had reached 36 by July 1949 and 4 regularly scheduled air lines were serving these airports. At this date also there were 181,155 telephones in service with a total telephone mileage of 398,759.2 and a total telegraph line mileage of 15,531.09. There were 19 standard AM radio stations, 3 FM stations, and 2 television stations by July 1949.

Banking and Finance.—The 55 banks, 44 state and 11 national, had total assets of $585,086,175.87 on Nov. 1, 1949, and total bank deposits of $547,183,655.53. On Dec. 31, 1948, the 13 state-chartered savings, building and loan associations had aggregate assets of $43,320,633.39. Also on Dec. 31, 1948, the 55 licensed small-loan companies had total assets of $8,011,536.03 as compared with the previous year's figures of 52 companies with assets of $7,328,519.13.

State receipts for the year ending June 30, 1948, were $72,782,544; expenditures were $71,668,282.54.

Agriculture.—The cash farm income rose from $155,442,000 for 1947 to $164,360,000 for 1948 with cash receipts from livestock and livestock products increasing from $103,723,000 to $109,777,000 and receipts from crops increasing from $51,719,000 to $54,583,000. Preliminary figures showed that in 1949 the state had 571,000 head of cattle, 113,000 milk cows, 98,000 hogs and pigs, 1,456,000 sheep and lambs, 61,000 horses, 3,079,000 chickens and 52,000 turkeys.

Table I.—*Principal Agricultural Products of Utah*

Crop	1949	1948	Average, 1938–47
Wheat, bu.	9,440,000	8,695,000	6,273,000
Barley, bu.	6,063,000	5,500,000	4,995,000
Oats, bu.	2,115,000	1,764,000	1,848,000
Potatoes, bu.	3,003,000	3,171,000	2,579,000
Sugar beets, tons	462,000	427,000	577,000
Hay (tame and wild), tons	1,219,000	1,134,000	1,141,000
Apples, bu.	428,000	450,000	477,000
Peaches, bu.	778,000	821,000	736,000
Tomatoes (processing) tons	83,000	71,000	
Celery, crates	320,000	273,000	

Manufacturing.—Preliminary reports showed that for 1949 employment in Utah averaged 129,000 per month with an estimated annual pay roll of $343,000,000 as compared with 1948 figures of 124,355 employed per month and an annual pay roll of $330,504,403. There were 12,336 firms in the state employing 1 or more workers, and of that figure only 8 companies employed 1,000 or more workers with 2,709 companies employing 1 person each.

Table II.—*Principal Industries of Utah*

Industry	Pay roll, 1948	Av. workers per month
Mining	$ 46,658,607	12,574
Contract construction	34,842,604	11,207
Primary metal industries	29,242,801	8,498
Transportation, communications and utilities	27,490,745	10,130
Food and food products	20,006,917	8,203
Printing and allied industries	6,014,613	2,050
Products of petroleum and coal	4,677,962	1,207
Stone, clay, and glass products	4,407,514	1,468
Fabricated metal products	2,932,548	963
Chemicals and allied products	2,473,810	802
Other industries	9,962,760	4,358
Total (all Industries)	$330,504,403	124,355

Mineral Production.—As a result of drastic reductions in the price of lead most of the producing mines at Park City were forced to close during the summer of 1949 and only a few continued curtailed production. By Jan. 1, 1950, Governor J. Bracken Lee had advised the miners of that district to seek employment elsewhere in view of low metal prices. The decline in output of ore in the state in 1949 with accompanying heavy losses of copper, gold and molybdenum could also be traced to a labour strike which closed the open-pit mine of the Kennecott Copper corporation in Bingham Canyon from Oct. 24, 1948, to Feb. 7, 1949.

Table III.—*Principal Mineral Production in Utah*

Mineral	1949	1948	1947
Gold, oz.	305,750	371,155	421,662
Silver, oz.	6,709,000	7,979,000	7,780,032
Copper, lb.	384,140,000	453,842,000	533,066,000
Lead, lb.	103,170,000	112,150,000	99,396,000
Zinc, lb.	78,730,000	82,450,000	87,346,000

Vanadium: *see* MINERAL AND METAL PRODUCTION AND PRICES.

Vandenberg, Arthur Hendrick (1884–), U.S. senator, was born March 22 in Grand Rapids, Mich. He studied at the University of Michigan law school, Ann Arbor, Mich., for a year, then joined the *Grand Rapids Herald* as a reporter, becoming in time that paper's editor and general manager. He was appointed to fill a U.S. senate vacancy in 1928, and was re-elected in 1934, 1940 and 1946. Vandenberg was a noninterventionist up to the time the U.S. became involved in World War II, but generally throughout the war he supported the administration's foreign policies, and in 1945 Pres. Franklin D. Roosevelt appointed him a delegate to the organization conference of the United Nations in San Francisco, Calif. When the Republicans gained control of the senate in 1946, he was named president pro tempore, but after the Democrats regained control in 1948 he continued to exemplify the bipartisan foreign policy as Republican leader of the senate foreign relations committee. Throughout 1948 he was regarded as a leading "dark horse" candidate for the Republican presidential nomination, but at the convention was not actually a strong challenger.

In 1949 Vandenberg lent his full support to the bipartisan effort to pass through the senate the North Atlantic treaty and the program for giving military assistance to the countries joining in that treaty. In February he gave his full endorsement to Pres. Harry Truman's request for $5,580,000,000 for the second year of the European Recovery program. On May 7 President Truman awarded him the annual Collier's Congressional award for distinguished service. On only one point of administration foreign policy was Vandenberg especially critical: he scored the administration's policy in China as a "tragic failure."

Vatican City State.

This sovereign independent state was established by the Lateran treaty between the Holy See and the Italian government on Feb. 11, 1929. The treaty is recognized in international law, and the reigning pope is the sovereign. The area of Vatican City is 108.7 ac., excluding the papal estate of Castel Gandolfo and certain basilicas in Rome which are extraterritorial. Executive powers are exercised by the governor, responsible to the pope.

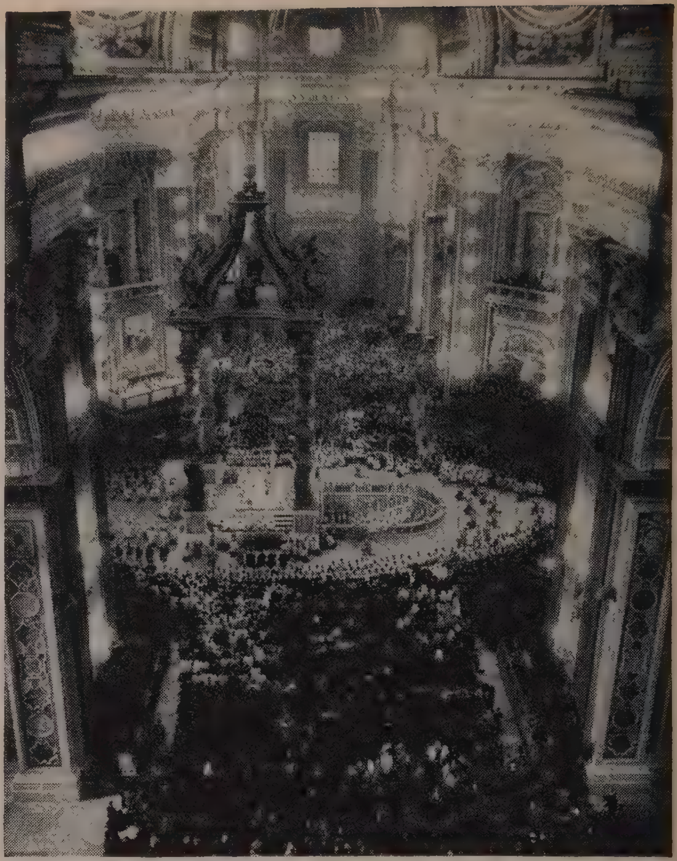
The Vatican in 1949 had 31 nuncios, representatives of ambassadorial rank and 6 internuncios, representatives of lesser rank. The Vatican sent apostolic delegates, representatives without accredited rank, to 23 countries; 43 diplomatic representatives were accredited to the Vatican including 16 ambassadors and 24 ministers.

Premier Alcide de Gasperi of Italy paid a state visit to Pope Pius XII Feb. 11 in commemoration of the 20th anniversary of the Lateran pact.

In March Archbishop Fernando Cento, apostolic nuncio to Belgium, served as representative of the Holy See at the International Council of the European Movement. Archbishop Cento said the Church rejoiced because European unity was becoming a reality since the civilization of Europe was based on Christianity.

On July 6 the first minister of India to the Holy See presented his credentials. In his address to the new envoy the pope stressed the important role which the far east, and India in particular, is called upon to play in stemming the tide of materialism and referred to India's position of responsibility.

The Holy See was represented at the negotiations at Geneva, Switzerland, for new international treaties in favour of prisoners, wounded and civilians in time of war. Apostolic nuncio to Switzerland, Archbishop Philip Bernardini, headed the Holy See delegation. Although proposals to mention man's divine origin as the source of human rights were not accepted, of the 20 other amendments put forward by the Holy See all were accepted in substance. These dealt with religious assistance to prisoner-of-war and internment camps, regulations for divine worship, supply of reading matter, visits by representatives of religious authorities and, above all, freedom of and a greater recognition for the nongovernmental welfare agencies. Although the Vatican state was a member of some international organizations and the Holy See had been represented in an unofficial or observer's capacity at various international conferences since 1870, its participation in the conference of Geneva probably constituted the first time since 1870 that it had been invited and admitted to a diplomatic conference on a level with states, where its representatives exercised the rank and functions of minister plenipotentiary.



CANONIZATION CEREMONIES during which Jeanne de Lestonnac of France was raised to sainthood on May 15, 1949, by Pope Pius XII at St. Peter's basilica in Vatican City.

Oct. 25 the Vatican announced Msgr. Aloysius Joseph Muench, bishop of Fargo, N.D., had been appointed regent of the apostolic nunciature in Germany, with his seat at Eichstätt. Konrad Adenauer, west German federal chancellor said the Holy See was the first foreign power to nominate a diplomatic representative at Bonn.

The Vatican's position on the question of the Holy Land was made clear in an encyclical demanding internationalization of Jerusalem and freedom for religious institutions.

Because of continued attacks by the Communists against the representatives of the Vatican the Supreme Congregation of the Holy Office decreed that all supporters of Communist doctrines were to be excommunicated. (*See* also Pius XII; Roman Catholic Church.) (J. LaF.)

Vegetable Oils and Animal Fats.

Domestic production of fats and oils in the U.S., including the oil equivalent of exported seeds, in 1949 was forecast at a new high of about 12,010,000,000 lb., compared with 11,786,000,000 lb. in 1948 and a prewar level of 8,696,000,000 lb. Several of the oilseed crops were large, particularly cottonseed and soybeans. But even the animal fats were abundant, lard and butter in surplus being included in government purchases. Domestic consumption, on the other hand, was smaller in 1949 than in 1948, and the excess of production over consumption widened to a new record of 1,400,000,000 lb.

*U.S. Production of Principal Fats and Oils**

(In millions of pounds)

	1949†	1948	1943	Average, 1937–41
Butter	1,800	1,663	1,843	2,220
Lard	2,850	2,526	3,267	2,091
Edible tallow	180	182	213	225
Edible vegetable oils	4,000	4,355	2,761	2,253

Drying oils	840	839	804	363
Other oils	20	18	32	21
Totals	12,010	11,786	11,021	8,696

*Year beginning October.
†Partly forecast.

Total U.S. butter production in 1949 was estimated at 1,800,000,000 lb., about 8% more than in 1948. Production of lard and pork fats increased more than 300,000,000 lb. in 1949, primarily because the record corn crop of 1948 stimulated retention of a larger number of brood sows. Fats from other animals remained approximately on the previous level of production. Vegetable oilseeds, however, were slightly less abundant; the 1949 cottonseed crop was about 9% more than that of the previous year; soybeans were a near record crop; flaxseed production declined, compared with 1948, but was 45% more than average. The peanut crop was an average one, with acreage allocations and marketing quotas in force.

As in 1948, prices of most fats and oils declined sharply in February, recovered moderately and then declined again as the abundant harvests became more certain. Prices ranged from two-thirds down to less than one-half of their postwar peak levels reached early in 1948. Butter was about 60 cents wholesale, lard between 10 and 12 cents and soybeans were about half the extreme levels of the past few years.

Exports of most sorts of fats and oils from the U.S., largely to western Europe, increased in 1949. For the first nine months of the year the outgo was threefold that of 1948—1,826,200,000 lb. against 658,300,000 lb. in the previous period. Lard made up nearly one-third of the total. Imports declined, but less sharply than exports increased, amounting to 756,400,000 lb. in the first nine months of 1949, compared with 938,900,000 lb. in the comparable period of 1948.

In 1949 the house of representatives passed the oleomargarine bill, and it was to be debated by the senate early in 1950. As passed by the house, the bill provided for repeal of the 10 cents a pound tax on yellow margarine; repeal of the one-fourth cent per pound tax on white margarine; repeal of all licence fees on margarine manufacturers, wholesalers and retailers; and provided that public eating places must serve it in triangular shape to differentiate it from butter. Consumption of margarine in the U.S. declined about 8% in 1949 to 5.6 lb. per capita, which was nevertheless nearly double the prewar rate.

Synthetic detergents continued to make further inroads during 1949 into the amount of fats and oils needed for soaps. Soybean oil futures trading was commenced.

Although fats and oils on a world-wide basis in 1949 approximated 100% of prewar production, they were still the major food in short supply in some parts of the world, particularly in the occupied areas of central Europe and Japan. The more abundant crops of the U.S., plus some increase elsewhere, provided an increase of about 10% in export volume over 1948, although world trade was still 20% less than prewar. The peanut production scheme for some African areas had thus far proved disappointing. The olive oil crop of the Mediterranean countries of Europe in 1949 was an abundant one. All in all, the fats and oils shortage appeared to be much relaxed, with effective demand measured by available hard currency the major block rather than tight supplies. (*See* also COTTON; PEANUTS; SOYBEANS.) (J. K. R.)

Vegetables.

The U.S. 1949 crop of 25 vegetables, classed as commercial truck crops for the fresh market (strictly market garden areas and farm gardens not included), was a large and valuable one in comparison with the average for the previous decade, although slightly below 1948 in tonnage, acreage and value. Consumption per capita of fresh vegetables in 1949 was estimated at 243 lb., only 95% as much as in 1948 but 103% of the prewar average. Prices averaged slightly higher than in 1948. The Cuban crop of 1949–50 appeared to be 10% larger than in recent years.

The 1949 U.S. production of 11 truck crops for commercial processing was 5,522,610 tons with new high record crops of sweet corn, pickling cucumbers and green lima beans. Acreage increased to 1,727,640, as compared with 1,697,870 ac. in 1948, and an average of 1,742,880 ac. in the decade 1938–47. Freezing made further gains as a processing method.

Commercial Truck Crops for the Fresh Market.—The total tonnage of 25 crops was 8,186,200 tons in 1949, valued at $589,757,000, compared with 8,459,700 tons in 1948 and 7,383,800 tons average for the previous decade. Production declined for 15 of the crops, increased for 10. Cabbage was the leading crop in tonnage, with 1,218,000 tons; lettuce was in second place with 1,171,100 tons; and watermelons were third with 960,000 tons. California was the leading state with 2,372,700 tons; Florida second with 908,200 tons; and New York third with 726,800 tons.

Watermelons	melons	76,801	73,878	68,619

Acreage for harvest in 1949 was 1,786,440, compared with 1,802,342 ac. in 1948; as compared with the previous decade, acreage was larger for the fall and winter harvest seasons. California, as usual, was the leading producer with 355,260 ac. devoted to such truck crops, followed by Texas with 304,600 ac. and Florida with 222,250 ac.

The total value of these crops was 1% less than in 1948, but 41% more than average for the decade; fall and winter crops were more valuable than in 1948, whereas spring crops were 13% less valuable and summer crops 2% below 1948. Lettuce, valued at more than one-fifth of the total for the 25 crops, was the leading crop in value, followed by tomatoes with about one-sixth.

Commercial Truck Crops for Processing.—The aggregate production in 1949 of 11 truck crops for commercial processing, including crops for canning, freezing, pickling and other processing, exclusive of dehydration, was 5,522,610 tons, compared with 5,471,500 tons in 1948, and 4,993,080 tons average for 1938–47. California produced 1,202,940 tons of the total and Wisconsin 635,790 tons. Tomatoes (2,633,700 tons) accounted for nearly one-half of the total, sweet corn, a record crop, for about one-fourth. Yields per acre were above average for all processing vegetables, except green peas and pimientos. Harvested acreage of 1,727,640 ac. was about 2% above 1948, but about 1% below average.

Processing vegetable prices per ton were moderately lower than in 1948, except asparagus. The total value of the crop was $206,144,000, compared with $214,559,000 in 1948 and $148,412,000 average for the decade 1938–47. Tomatoes were the largest contributor—$61,928,000. Smaller amounts of the 1949 crops of sweet corn, tomatoes, and cabbage were processed than in 1948, but several other vegetables were processed in larger amounts; the 1949 total pack of canned vegetables was about one-tenth less than that of 1948. Only freezing gained slightly over the previous year as a method of processing.

Table II.—*U.S. Production of 11 Vegetables for Processing*

(In tons)

Crop	1949	1948	Average 1938–47
Asparagus	112,750	91,240	86,650
Beans, lima	84,800	68,900	35,260
Beans, snap	233,010	187,030	180,070
Beets	144,100	94,200	116,280
Cabbage	169,400	203,700	170,000
Corn, sweet	1,398,300	1,262,100	1,037,270
Cucumbers	280,560	236,330	180,790
Peas, green	357,280	348,800	382,920
Pimientos	23,770	17,880	17,340
Spinach	84,940	47,820	72,100
Tomatoes	2,633,700	2,913,500	2,714,400

The U.S. dry edible bean crop of 1949 was a record one of 20,059,000 100-lb. bags (cleaned basis), compared with 19,420,000 bags in 1948 and an average for the decade of 15,640,000 bags. Michigan, with 5,736,000 bags (4,258,000 bags in 1948), produced 29% of the crop and California was second with 4,696,000 bags. The large crop, plus heavy carryover of about 5,000,000 bags, with government price support at 80% of parity on the 1949 crop appeared to indicate that a cut would be ordered in acreage for 1950 and the support level lowered. World edible dry bean production for the 1949–50 season was estimated at 115,000,000 bags, slightly below the previous year, and 8% more than average in the prewar period. The major postwar decrease was in Asia, the major increases in North and South America. Canada in 1949 produced the largest bean crop since 1941.

The dry pea crop of 1949 in the U.S. of 3,267,000 bags (uncleaned) was low compared with 1948 and very low compared with the 5,620,000 bag average of the previous decade. World production declined about 6% from the high level of the previous year, but was 16% above the prewar average.

Although exports of vegetables, either in fresh or processed form, were a comparatively small part of the crop, the rescinding by Canada on Oct. 1 of import restrictions on fresh vegetables opened the door for increased exports of tomatoes, lettuce, carrots, cabbage, celery and spinach. (*See* also Agriculture; Corn; Horticulture; Potatoes.) (J. K. R.)

Venereal Diseases.

Venereal disease continued to be a health problem of major dimensions in 1949. The World Health organization reported that estimates of the number of existing cases of syphilis alone ranged from 20,000,000 to 100,000,000; deaths from late syphilis were estimated to number at least 2,000,000 annually and rates for mortality from syphilis ranged from .8 to 210 per 100,000 population. Mortality rates were believed to be even higher in some unreported areas of the world.

Acknowledging the need for a public health approach to the problem of venereal disease, W.H.O. offered assistance to countries requesting its aid in instituting or improving venereal disease control structures. Its efforts were strengthened by material assistance provided by the United Nations International Children's Emergency fund to campaigns against syphilis in children and pregnant women.

United States.—In the United States, the outlook regarding venereal disease control was generally encouraging in 1949. The total number of syphilis cases (all stages) reported for the year ending June 30, 1949, for civilians in the United States and its territories, was approximately 14% lower than for the preceding fiscal year—296,455, as compared with 345,992.

Moreover, declining morbidity reports for the early stages of syphilis were believed to indicate that the incidence of the disease might be decreasing. Consistent quarterly declines for almost three years in the discovery rate of primary and secondary syphilis, and later declines in the discovery rate of early latent syphilis, suggested such a reduction in the number of new infections occurring. That these declines occurred in the face of a 30% increase in efforts to find cases of venereal disease strengthened the thesis of diminished incidence.

Reported cases of gonorrhoea were lower in 1949 than for any year since 1945. For the United States and its territories, the 1949 total among civilians was 342,856.

The latest data recorded on mortality from syphilis likewise showed declines from figures previously reported. General syphilis mortality dropped to an estimated rate of 8.2 per 100,000 population in 1948, while for the same year the rate of infant deaths caused by syphilis was estimated at .13 per 1,000 live births. The admission rate to mental hospitals for psychoses due to syphilis (excluding Veterans' administration facilities) was 4.2 per 100,000 population in 1947 as compared to 6.3 in 1938.

Activities of Health Departments—The emphasis placed on case-finding by health departments in the United States was reflected in the number of diagnostic observations completed in public clinics during the year. The total number was 2,276,000 observations. As a result of these examinations, almost 500,000 persons were diagnosed in clinics as having a venereal disease.

Interviewing of patients and investigation of their contacts continued as major case-finding activities carried on by public clinics. Of a total of 534,000 case-finding investigations completed by staffs of these clinics, approximately 70% were made on contacts of persons known to have a venereal disease. The remaining 30% of investigations were made on persons brought to the attention of the clinics because of positive tests in premarital or prenatal examinations or in mass blood testing surveys or through other means.

More than half of all syphilis cases diagnosed in public clinics were referred to inpatient facilities for treatment. Almost all the gonorrhoea cases diagnosed in the clinics were treated in the clinics.

Admissions to rapid treatment centres, declining 11% from the figure reported for the preceding year, numbered 160,066 in the fiscal year 1949. Syphilis patients comprised 79% of this total, while gonorrhoea patients and patients with other venereal diseases comprised 3% and 2% respectively. The remaining admissions were observation cases, persons found after examination not to have a venereal disease and patients admitted for treatment because of exposure to early infectious syphilis.

Special projects to demonstrate case-finding methods were conducted by health departments, with federal aid, in more than 1,500 communities in 36 states and territories. These projects consisted of mass blood testing, contact investigation or public information programs or combinations of these case-finding techniques.

Treatment—Procaine penicillin was widely used in the United States in the treatment of syphilis, largely replacing penicillin in oil and beeswax. Clinical investigation of procaine penicillin, with aluminum monostearate added to delay absorption, was

continued. The U.S. public health service reported that results of treatment with this preparation appeared to compare favourably with those obtained with penicillin in aqueous solution, which required more frequent administration. These results were considered preliminary, however, requiring a longer period of posttreatment observation before definite conclusions were justified.

Evaluation of schedules of treatment employing penicillin in aqueous solution and in oil and beeswax continued to show that where frequency of administration and quantity of penicillin were properly balanced, excellent results might be expected. Studies, after 12 to 15 posttreatment months, of several of the more effective schedules using these older forms of penicillin therapy showed that retreatment was necessary in less than 12% of the observed cases. (*See* also *Europe and British Commonwealth*, below.)

Bibliography.—Annual Report, Federal Security Agency, Public Health Service (1949); *Programme and Budget Estimates for 1950*, Official Records of the World Health Organization, no. 18 (Geneva, 1949).

(T. J. B.)

Europe and British Commonwealth.—Incidence showed a steady decline after the peak year of 1946 when in Great Britain alone 17,675 cases of early syphilis and 47,343 cases of gonorrhoea were treated at the various government and municipal clinics. In 1948 early cases of syphilis numbered 10,637 and gonorrhoea 30,312. Reports for 1949 showed that this decline was maintained.

Among the native populations of South Africa, Kenya and Southern Rhodesia the incidence remained high. In Southern Rhodesia alone nearly 600,000 received treatment and subsequent reports indicate that the numbers did not decrease: the diseases were widespread in both urban and rural areas. Efforts were made to bring penicillin into general use in the treatment of all cases of early syphilis; but the supply position prevented the institution of this as the standard procedure. It should also be noted that the incidence among service personnel in the Mediterranean, East Indies, Singapore and the far east remained high.

In France and Germany the incidence lessened but only slightly. This was probably owing to the fact that many continental venereologists did not use penicillin in the treatment of syphilis and gonorrhoea to the same general extent as was customary in the United States and Great Britain. In this connection it was interesting to note that no worker in this field in either of the two latter countries reported a definite case in which the infecting organisms of these two diseases were penicillin-resistant.

In Sweden with a population of just less than 7,000,000 there were 1,026 cases of early syphilis and 10,597 of gonorrhoea in 1948, a fall of 181 and 1,053 respectively compared with the figures for the previous year. There was every reason to believe that this trend was continued during 1949, an observation that applied to all other European countries for which statistics were available.

The incidence of nongonococcal urethritis in the male, a disease that is commonly venereal in origin, showed a definite increase. However, this could partly be attributed to the fact that in the past many workers considered all cases of urethritis to be gonococcal in origin and therefore noted them in their official returns as gonorrhoea although the gonococcus was never found in the secretions. It was owing to the increasing use of penicillin, which was found to cure all cases of gonorrhoea but to be usually ineffective against nongonococcal urethritis, that differential diagnosis in such cases became more accurate. Reports showed that nongonococcal urethritis in its abacterial form was at this time the most common venereal disease, but one upon which very little research had been carried out. The Expert Committee on Venereal Diseases of the World Health organization sitting at Geneva, Switz., recommended the collection of data on this condition and three memoranda were issued.

Advances in the treatment of the venereal diseases generally were associated chiefly with aureomycin. It was shown to have a low toxicity when administered orally in moderate dosage and to be curative in gonorrhoea (H. S. Collins *et al.*, 1948, C. H. Chen *et al.*, 1949); lymphogranuloma inguinale (L. T. Wright *et al.*, 1948, H. S. Collins *et al.*, 1948); granuloma venereum (L. T. Wright *et al.*, 1948, R. B. Greenblatt *et al.*, 1949); chancroid (C. H. Chen *et al.*, 1949); certain types of nongonococcal urethritis due to the virus of inclusion conjunctivitis (A. H. Harkness, 1949) and possibly pleuropneumonialike organisms (H. S. Collins *et al.*, 1948, R. R. Willcox and G. W. M. Findlay, 1949, A. H. Harkness, 1949). Confirmation was also obtained for the effectiveness of aureomycin in the treatment of syphilis both in its early and later manifestations. (P. A. O'Leary *et al.*, 1948 and 1949) but extensive trials in this field still remained to be carried out. There appeared to be great possibilities in the extensive use of aureomycin in prophylaxis since it had been shown to be effective against six venereal diseases.

Another antibiotic, chloromycetin, was proved by R. B. Greenblatt and his collaborators to be effective against granuloma venereum and there were indications that it might also prove useful in cases of certain types of nongonococcal urethritis.

(A. H. Hs.)

Venezuela. A republic on the north coast of South America, Venezuela is bounded on the north by the Caribbean sea, on the east by British Guiana, on the south by Brazil and on the west by Colombia. Area: 352,143 sq.mi. Pop. (est. July 1949) about 4,500,000. Approximately 10% of the entire population lives in the capital, Caracas, and its suburbs; while Maracaibo (150,000), Valencia (65,000), Barquisimeto (60,000), Puerto La Cruz (45,000), San Cristóbal (40,000), Maracay (35,000), Ciudad Bolívar (30,000) and Coro (25,000) are the other large cities. Executive power was exercised throughout 1949 by the military junta, composed of Lt. Col. Carlos Delgado Chalbaud, Lt. Col. Marcos Pérez Jiménez and Lt. Col.

Luis Llovera Páez.

History.—The political tension of late 1948 gradually relaxed during 1949, as it became apparent that an orderly liquidation of the crisis was destined to occur. Decrees provided for the invalidation of the confiscation of private property in the years 1945–48 and the eventual restoration of the property. Diplomatic relations with the United States, Great Britain, Spain and other countries were resumed early in 1949. A commission was set up late in 1949 to frame an electoral law by virtue of which a national congress would be chosen with power to revise the constitution. On Nov. 24, an amnesty of political prisoners, and municipal elections, to be held at an early date, were decreed.

The year 1949 was marked by a determined effort to restore order to public finance; and a general overhauling of fiscal administration was undertaken. Venezuela continued in 1949 to be the foremost exporter and second producer of petroleum products. Early in 1949, temporary market conditions led to a slight falling off in production, but in the second half year it rose again and reached a peak of 1,400,000 bbl. per day in the last months of the year.

The year 1949 witnessed substantial progress in the initial stages of the iron mining enterprises of the Bethlehem Steel company and the United States Steel corporation south of the Orinoco river. These operations foreshadowed an economic development of the east and south which would hasten the realization of great hydroelectric projects and the utilization of natural gas for industrial purposes.

Venezuelan price levels rose only slightly during 1949. The currency was one of the few in the world whose statutory basis had not been changed in the 20th century. The housing shortage in Caracas was slightly less pressing; in some provincial cities it became more acute. There was no significant unemployment reported during the year.

Government activity in forestry, in irrigation, agricultural education, experiment stations and pest control was noteworthy in 1949. The problem of adequate supplies of meat and dairy products was attacked by the ministry of agriculture and Corporacion de Fomento, a government long-term financing authority. The activities of the ministry of development embraced a wide variety of mining and petroleum interests, as well as industrial promotion in many lines. Some hundred miles of new roads were constructed and old roads were repaired; the program of school and hospital construction was advanced. In the city of Caracas the construction of a central arterial boulevard, the Avenida Bolivar, was brought close to completion by December. Plans were completed for new highways between the capital and the improved seaport of La Guaira. (C. Me.)

Education.—At the beginning of the school year 1947–48 there were 4,951 primary schools, with an enrolment of 329,821 pupils. In March 1949, secondary and special schools, public and private, numbered 132, with an enrolment of 20,047; the 12 institutions giving preuniversity training had 1,158 students. There were 3 universities. About 7.5% of the 1947–48 budget was earmarked for education.

Finance.—The monetary unit is the bolívar, valued at $0.2985 U.S. currency, controlled and free selling rates, on Dec. 1, 1949. The budget for the fiscal year 1950 (July 1, 1949–June 30, 1950) estimated expenditure at 1,610,400,000 bolívares (actual expenditure 1948–49: 1,917,520,045 bolívares; actual revenue: 1,962,709,534 bolívares). There was no external debt. The domestic debt on Dec. 31, 1948, was 22,800,000 bolívares. Currency in circulation on Oct. 31, 1949: 710,000,000 bolívares; sight deposits: 661,000,000 bolívares; time deposits: 130,000,000 bolívares; government deposits: 368,000,000 bolívares; gold reserve of the Central bank and treasury: $373,000,000.

Trade and Communications.—Exports in 1948 totalled 3,340,000,000 bolívares; imports were 2,296,000,000 bolívares. Chief exports were crude petroleum and petroleum products (97%), coffee (1%) and cacao (1%). Chief imports were machinery and equipment (32%), metals and manufactures (18%), foodstuffs and beverages (16%) and textiles (10%). Chief suppliers were the U.S. (73%) and the United Kingdom (8%). Major customers were the Netherlands Antilles (petroleum for refining) and the U.S.

Railway transportation is not highly developed and equipment is obsolete and in need of repair; trackage totalled 700 mi. in 1949. The highway system (1948) included 3,750 mi. of all-weather roads and 1,600 mi. of unimproved, dry-weather roads. Motor vehicles on June 30, 1949, included 23,436 automobiles, 6,347 trucks and 830 buses. According to Lloyd's Register of Shipping, the merchant marine (June 30, 1948) had 64 steamers and motor ships (100 tons and over) aggregating 95,591 gross tons and 6 sailing ships and barges aggregating 1,044 tons. Telephones numbered 48,800 in 1948.

Agriculture.—Agriculture does not supply the basic foodstuff needs of the population. Output of coffee, the chief export crop, totalled 778,794 bags of 132 lb. each in 1947–48; exports in 1948 were about 600,000 bags. Exports of cacao (1948) were 19,960 short tons. Sugar production (1948) was 29,275 short tons; maize 532,000 tons and rice 25,000 tons. Production of fish was reported to be 57,630 short tons in 1948; lumber production was 151,308 cu.m. (1 cu.m. = 424 bd.ft.).

Manufactures.—Production figures in 1948 included: cement 235,457 short tons; tires 38,736 units; tubes 33,012 units; soap 21,165 short tons; cigarettes 1,848,000,000 units; electric energy 643,140,000 kw.hr.; natural gas 13,320,000,000 cu.m. Textile mills supply about one-third of domestic needs. The cost of living index (food, coal and soap) stood at 202 in July, 1949 (1937 = 100).

Mineral Production.—Petroleum is the dominant factor in the Venezuelan economy. Production in 1948 reached the record figure of 490,015,000 bbl. Crude petroleum exports totalled 437,699,658 bbl.; exports of refined products were 31,390,974 bbl. Investments by the 13 oil companies operating 54 productive fields were estimated in June, 1949, at over 3,090,000,000 bolívares. Refinery output by ten refineries and topping plants in operation in 1948 totalled 43,512,541 bbl. Several new refineries, topping plants and pipe lines were under construction in 1949. Production of other minerals in 1948 included 49,730 oz. of gold and diamonds totalling 75,513 carats. A subsidiary of Bethlehem Steel Corp. completed plans for the large-scale mining of iron ore in 1949.

Vermont.

A north Atlantic state of the United States of America, the only one of the New England states without a sea coast, Vermont is popularly known as the "Green Mountain state"; it was admitted to the union in 1791. Area: 9,609 sq.mi., of which 331 sq.mi are water. Population (1940), 359,231 (including 235,992 rural, 123,239 urban); 328,740 native white including 71,180 of foreign and mixed parentage; 384 Negro, 41 of other races. The U.S. bureau of the census on July 1, 1949, estimated the population of the state to be 369,000. Montpelier is the capital city, with a population (1940) of 8,006. The chief cities are Burlington (27,686) and Rutland (17,082).

History.—The general assembly met from Jan. 5 to May 13, 1949, the longest legislative session in the history of the state. Legislation enacted or amended included: the designation of the sugar maple as the state tree, provision for the construction of new state buildings and a public health laboratory, the reorganization of the department of health, approval of the New England Interstate Water Pollution Control compact and the Northeastern Fire Protection compact, licensing and regulation of hospitals, regulation of school buses, radical changes in distribution of state-aid for education and control of brucellosis in cattle.

The chief officers of the state during 1949 were: Ernest W. Gibson, governor; Harold J. Arthur, lieutenant governor; Levi R. Kelley, state treasurer (to September); Howard E. Armstrong, secretary of state; David V. Anderson, auditor of accounts; Clifton G. Parker, attorney general.

Governor Gibson's appointment to the office of federal district judge of Vermont, by Pres. Harry S. Truman was announced Oct. 17, to take effect in Jan. 1950. Governor Gibson appointed George H. Amidon to the office of treasurer, Sept. 6, to succeed Levi R. Kelley who resigned to become treasurer and business manager of the University of Vermont and State Agricultural college, Burlington.

The new state office building dedicated on Nov. 8, 1948, by Governor Gibson was opened on Sept. 16, 1949.

Education.—There were approximately 855 elementary schools in Vermont in 1948–49 with a teaching staff of 1,769 and enrolment of approximately 43,000. There were 84 public high schools with a teaching staff of 719 teachers and enrolment of 15,109. A total of $4,066,335.85 was spent on education by the state of Vermont during the fiscal year ending June 30, 1949. State superintendent of schools was the commissioner of education, A. John Holden who succeeded Ralph E. Noble on Aug. 1, 1949.

Social Insurance and Assistance, Public Welfare and Related Programs.—Relief in general was administered by the overseer of the poor in each town. Approximately 6,747 persons a month received old-age assistance from state funds to the amount of $2,765,111.69 for the year 1949. Dependent children receiving aid from state funds averaged 2,578 representing payment of $570,648.95 to 947 mothers' aid recipients a

Table I.—*Leading Agricultural Products of Vermont*

Crop	1949	1948	Average 1938-47
All corn, bu.	2,565,000	2,288,000	2,488,000
Oats, bu.	1,178,000	1,480,000	1,507,000
Hay, all, tons	1,369,000	1,597,000	1,349,000
Potatoes, late, bu.	1,128,000	1,295,000	1,519,000
Apples, commercial, bu.	1,089,000	774,000	1,089,000
Maple syrup, gal.	554,000	619,000	912,000

Table II.—*Principal Manufacturing and Processing Industries of Vermont*

Industry	Value of products 1948 (est.)	1947
Machines, machine tools and allied industries	$66,426,835	$65,300,110
Dairy products	55,164,300	54,603,260
Woollen, cotton and knit goods	48,801,020	48,221,991
Woodworking, furniture and lumber	30 399,083	39,553,304
Granite, marble and other stone industries	20,174,410	19,097,715
Paper and paper products	19,201,565	18,814,050

month. Blind assistance funds amounting to $85,878.55 for the year were distributed to about 184 persons a month; aid to adult crippled persons amounted to $28,431.04 for the year, distributed to approximately 185 persons a month. Unemployment compensation payments made under the state law numbered 211,900 and amounted to $3,923,951.08 in 1949; 73,301 readjustment allowance payments under the G.I. Bill of Rights amounting to $1,443,523 were paid for unemployment and 954 payments totalling $84,913 were made to self-employed veterans. The three state correctional institutions, during the fiscal year ending June 30, 1949, had an average of 318 inmates; their total expenses were $498,542.76.

Communications.—The total mileage of the public highway system (state, state-aid and town highways) as of June 30, 1949, was 13,968.74, of which 1,805.15 mi. were in the state system and 2,775.11 mi. in the state-aid system. Total expenditures during the fiscal year ending June 30, 1949, amounted to $11,476,210.53 of which $7,367,538.39 was for state highways and $2,749,718.81 for state-aid highways. There were 959.04 mi. of railways in the state in the year ending Dec. 31, 1949; airports in the state numbered 23, airways 2, with a total mileage of 207. Telephone subscribers, as of Dec. 31, 1949, were estimated at 80,943.

Banking and Finance.—The number of state and national banks as of June 30, 1949, was 79, of which 40 were state banks with total deposits of $204,391,610.45 and assets of $228,932,849.77. There were eight co-operative building, savings and loan associations with total assets of $3,719,832.43.

Total receipts of the state as of June 30, 1949, were $32,540,024.69; disbursements $36,509,578.86; unappropriated surplus $230,241.14; obligations outstanding $2,220,000.

Agriculture.—The total acreage of harvested crops in the state in 1949 according to the U.S. bureau of agricultural economics was 1,153,000, compared with 1,149,000 in 1948.

Manufacturing.—No statistics on manufactures for 1949 were available from the department of industrial relations or the director of research and planning, partly because of uncertain economic conditions. According to the Vermont unemployment compensation commission there were 59,077 individuals employed by employers (all industries) covered under the Vermont Unemployment Compensation law. During 1949, it was estimated that all persons covered by this law earned approximately $140,000,000.

Mineral Production.—Leading mineral products of the state in 1949, according to the director of research and planning, were granite, marble, lime, talc and slate. Asbestos production, though small, was the largest in the United States so far as known. (C. E. Fe.)

Veterans' Administration (U.S.).

By Nov. 1, 1949, living U.S. veterans of all wars numbered 19,008,000, of whom 15,268,000 had served in World War II. Veterans with their families made up about one-third of the nation's total population.

Following are the major services administered by VA for veterans, their dependents and beneficiaries:

Education and Training.—Public law 266, passed Aug. 24, 1949, prohibited veterans from taking G.I. bill courses for avocational and recreational purposes, but exempted flight training from the procedures. To learn to fly under the G.I. bill, a veteran had to submit a certificate showing physical qualification for flight training, along with his own affidavit, supported by the corroborating affidavits of two competent disinterested persons, that flight training would be useful to him in connection with earning a livelihood.

By Nov. 1, 1949, more than 6,400,000 veterans had, at one time or another, taken education and training under the G.I. bill.

Enrolments in colleges and universities continued to drop from the peak of 1,158,000 recorded in the fall of 1947; on Nov. 1, 1949, the figure was 738,000. Enrolments in schools below the college level, however, increased. On Nov. 1, 1947, nearly 591,000 veterans were enrolled in such schools; on Nov. 1, 1949, the total had reached a new high of 808,000.

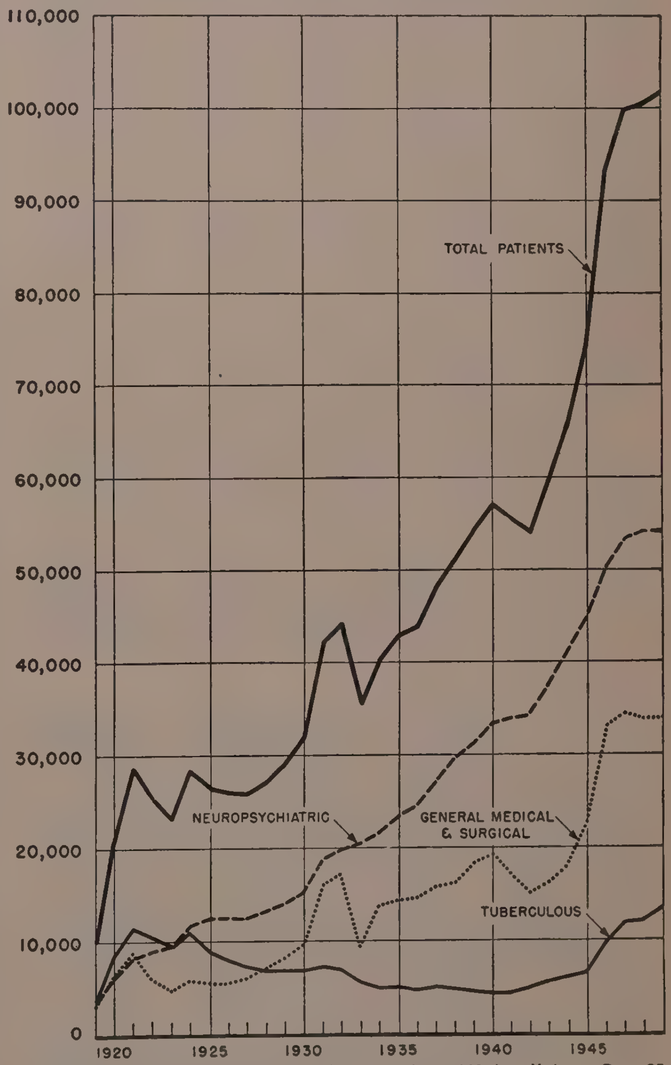
The number of on-the-job trainees continued to drop steadily, reaching a new low of 285,000 on Nov. 1, 1949. Institutional on-farm training enrolments increased, to 304,000 on Nov. 1, 1949.

Training for the Disabled.—On Nov. 1, 1949, about 528,000 eligible World War II veterans with service-connected disabilities, in need of vocational training to overcome their handicaps, were enrolled in schools, on-farm training courses or on-the-job training programs. Enrolments in all types of training except on-farm courses had been decreasing steadily. Peak college enrolments were reached in the fall of 1947, with 87,000 disabled veteran-students; on Nov. 1, 1949, the total was 52,000. Enrolments in schools below college level dropped from a peak of 40,000 on March 1, 1947, to 31,000 on Nov. 1, 1949.

Farm training enrolments, on the other hand, had risen, reaching a peak of 43,000 on Nov. 1, 1949. Job training had been declining since the peak of 108,000 was reached on Sept. 1, 1947. On Nov. 1, 1949, the total was 58,000.

Loans.—By Nov. 1, 1949, a total of 1,781,000 G.I. loans of all types, amounting to more than $9,600,000,000, had been approved by VA. About 90%, or 1,625,000, were for homes; 53,000 for farms and 113,000 for businesses.

During the latter part of 1949, veterans experienced less



NUMBER OF VETERANS remaining in VA and non-VA hospitals on Dec. 31 from 1919 to 1949 by types of disability, as compiled by the Veterans' administration difficulty in obtaining G.I. home loans than at any time in the previous two years. VA received nearly 40,000 applications for G.I. home loan guarantees during Oct. 1949 alone—the highest number received in any month since Nov. 1947.

Veterans had made excellent records in meeting their G.I. loan obligations. By Oct. 25, 1949, a total of 135,934 loans had been paid in full. By the same date, VA had paid claims on only 12,574 defaulted loans. Although defaults cost the government more than $14,000,000, part of this amount was still subject to further recovery.

Readjustment Allowances.—The readjustment allowance program—established by the G.I. bill to provide financial assistance for unemployed, partially employed and low-income self-employed veterans—came to an end for most World War II veterans on July 25, 1949. By that date, more than 8,000,000 veterans had been on VA's rolls. They had obtained $3,000,000,000 in unemployment payments and more than $500,000,000 in self-employment allowances.

Two categories of veterans still might be eligible for readjustment allowances: (1) those who served a minimum of 16 days between Sept. 16, 1940, and July 25, 1947; had at least 90 days total service; and were discharged under conditions other than dishonourable after July 25, 1947; (2) those who enlisted or re-enlisted under the Armed Forces Voluntary Recruitment act, between Oct. 6, 1945, and Oct. 5, 1946.

Medical and Hospital Benefits.—A veterans' hospital construction program costing $750,000,000 was under way in 1949—to provide 67 modern new hospitals with a total of 38,600 beds. By Nov. 1, 1949, five new hospitals had been completed.

On Nov. 1, 1949, there were 97,336 patients in all VA hospitals and 11,692 in other than VA hospitals, or a total of 109,028.

Domiciliary care was available at 15 VA homes for veterans with a chronic condition incapacitating them from earning a living but requiring minimal medical attention. Nearly 17,000 veterans were in VA homes on Nov. 1, 1949.

Insurance.—In nine years, VA had issued more than 20,000,000 National Service life insurance contracts having a face value of nearly $156,000,000,000. On Oct. 1, 1949, more than one-third, or 7,190,000 policies, still were in force.

In 1949 VA announced that about 16,000,000 existing and former holders of National Service life insurance would share in a special dividend payment totalling $2,800,000,000. This would cover the time insurance was held in force from the time the policy first was taken out up to its anniversary date in 1948.

Pensions and Compensation.—Monthly rates of disability compensation continued to range from $15 to $150, depending on the degree of disability, plus statutory awards for amputations, blindness, etc., which might bring total payments to a maximum of $360 a month.

On Nov. 1, 1949, a total of 2,333,070 veterans of all wars were on VA's compensation and pension rolls. At the same time, 967,180 dependents of deceased veterans were obtaining death compensation and pension payments.

Living veterans on VA rolls, as of Nov. 1, 1949, included: Civil War, 20; Indian wars, 591; Spanish-American War, 97,042; World War I, 494,377; regular establishment, 51,266; and World War II, 1,689,774. Dependents of deceased veterans included 392,713 widows, 286,856 children and 287,611 parents.

Veterans of Foreign Wars: *see* Veterans' Organizations.

DISABLED AMERICAN VETERANS working at the Idento-Tag plant owned and operated by their organization in Chicago, Ill., where miniature auto licence plates were manufactured and mailed to 30,000,000 U.S. car owners in 1949

Veterans' Organizations.

United States.—During 1949 there was a continued drop in the over-all membership of veterans' organizations in the United States. Approximately 5,000,000 veterans were organized, a drop of 3,000,000 from the 1946 peak. Of this membership 80% was in the American Legion and Veterans of Foreign Wars.

American Legion.—The American Legion had in 1949 about 3,000,000 members. During the year it emphasized strong support of a broad housing program aimed at getting more homes at better prices for veterans; continued its drive against communism by urging repressive legislation and holding seminars for its members concerning the nature of communism; and advocated a number of plans to strengthen veterans' benefits.

At its 1949 convention held in Philadelphia, Pa., the Legion for the first time elected a World War II veteran as national commander, George N. Craig, of Brazil, Ind. The convention adopted a program supporting the United Nations, the European Recovery program and the North Atlantic treaty; advocating a Pacific pact and aid to nationalist China; advocating universal military training and civil control of atomic energy; supporting the Mundt-Nixon bill curtailing communist activities; denouncing discrimination in education on any basis except that of scholastic requirement; recommending an increased community service program; and increasing Legion dues by 25 cents, the increase to be used for rehabilitation.

Veterans of Foreign Wars.—This organization, with 1,130,000 members, the second largest veterans' group, also elected in 1949 for the first time as its national commander a World War II veteran, Clyde Lewis of Plattsburg, N.Y. The 1949 program of the V.F.W. again emphasized support of a federal bonus with a maximum of $4,000, increases in veterans' compensations and pensions and a strong national defense program. Drastic economies and a stable membership year enabled the V.F.W. to achieve a solid financial position.

Disabled American Veterans.—Under the leadership of its national commander, Gen. Jonathan Wainwright, the Disabled

American Veterans in 1949 increased its membership to 141,361, the largest in its history. Its 1949 convention, held at Cleveland, O., elected David M. Brown of Akron, O., as its new national commander and once again emphasized the D.A.V. program of increased aid to disabled veterans and their families. Strong attacks were made on cutbacks of the Veterans' administration hospital program.

American Veterans of World War II (Amvets).—Amvets at its 1949 convention held at Des Moines, Ia., elected as its new national commander, Harold Russell, handless star of the motion picture *The Best Years of Our Lives*. The two big issues facing the organization during 1949 were a proposed merger between Amvets and the other large World War II veterans' organization, the American Veterans committee, and a federal bonus for World War II veterans. While a majority of the national leadership were for a merger and against the bonus, rank and file delegates to the convention defeated both proposals. Amvets' new platform called for increased activity for veterans' benefits.

American Veterans Committee.—The membership of this organization dropped to about 30,000 in 1949, but through modified organizational policies it bettered its financial position. Its program again called for a full civil rights program, support of the European Recovery program and the North Atlantic treaty and increased housing and health legislation. It opposed a federal bonus.

Other Organizations.—In addition to the above organizations, numerous other groups were active. Most important of these were the Air Forces association, Army and Navy union, Jewish War Veterans, Catholic War Veterans, Regular Veterans association and Military Order of the Purple Heart. No new organizations of any importance were founded. The principal organizational trends of the year were: an effort at close liaison among the American Legion, V.F.W., D.A.V. and Amvets; a large increase in the number of local veterans' councils consisting of the active chapters of all veterans' groups in the area; an attempt to coalesce the individual divisional associations; the attempt to merge Amvets and A.V.C. into one large organization of World War II veterans.

One interesting development late in 1949 was a meeting held in Paris, Fr., to organize an international veterans' organization. No formal organization had been set up, but plans were made to do so during 1950. Veterans from the U.S., France, Great Britain, Italy, Belgium and the Netherlands and other non-Communist dominated countries were among those participating.

(Ri. A. B.)

Canada.—Although no spectacular gains in membership were recorded, all veterans' organizations in Canada were active throughout the year 1949. The Canadian Legion demanded conscription for Canada's reserve forces, recruiting of women for the reserve forces, outlawing of the Labor Progressive (Communist) party, deportation of any person of foreign birth who was found guilty of subversive activity and adoption of the red ensign as Canada's national flag. The Dominion Civil Service War Veterans' association called for more careful consideration of veterans in the civil service, including granting of permanent status to veterans listed as on a temporary status, extension of sick leave and benefits to veterans who had been wounded in active service and a federal medical plan for all federal civil servants. The Federation of British-Canadian Veterans of Canada appealed to the federal government for the same benefits for imperial veterans resident in Canada as for Canadian veterans, providing such imperials had lived in Canada prior to 1929. The year-old Royal Canadian Air Force association reported it had 7,000 members in 40 branches. Toward the end of the year the Canadian Women's Army Corps association, first women's veteran organization in the dominion, was formed.

(C. Cy.)

Other Countries.—In Sept. 1949 the membership of the British Legion was over a million; there were 5,500 branches, some of which were in the British communities abroad, and 3,000 branches of the women's section. The welfare work of the legion was effected through the 4,800 service committees comprised of members of the legion, and representatives of kindred bodies, such as the Soldiers', Sailors' and Airmen's Families association, the Forces Help society, the Red Cross and regimental associations.

These committees dealt with the problems of ex-service men and women, concerning pensions, employment and rehabilitation generally; in 1949 they gave advice and assistance on an average to 3,000 men and women every day.

The total cost of legion welfare and benevolent services in the year 1948–49 amounted to £1,135,197.

Sir Ian Fraser, and Lieut. Col. C. Gordon Larking were re-elected president and national chairman, respectively, at the British Legion annual conference held in May at Yarmouth.

(J. C. As.)

The British Empire Service league, representing more than 2,000,000 ex-service men and women throughout the British Commonwealth of Nations, held its tenth biennial conference at Ottawa, Ont., Sept. 11–17. Ex-servicemen's organizations, usually called legions, not only from all members of the Commonwealth of Nations and crown colonies but also from the independent republics of Ireland and Burma, were represented at the conference which was opened by Field Marshal Viscount Alexander of Tunis, grand patron of the Canadian Legion. He emphasized the need for the closest possible co-operation not only between the nations of the commonwealth but also with the United States of America and other people of good will. He welcomed the presence of representatives of the American Legion and the Veterans of Foreign Wars of the United States.

The most active European movement of ex-servicemen and that having the largest membership continued to be that of France. The *Union Française des Associations des Combattants* (U.F.A.C.) held its general annual assembly in Paris on Feb. 5–6, 1949. It consisted of 48 large and small associations with a total membership of 2,088,889. Léon Viala was re-elected chairman of the U.F.A.C.; Maurice de Barral, former secretary-general, became one of the four vice-chairmen; and the new secretary-general was Albert Morel.

In Poland three Communist-led ex-servicemen's organizations were merged in Warsaw on Sept. 1–2, 1949, in a single Union of Fighters for Freedom and Democracy (*Związek Bojowników o Wolność i Demokrację*) of which the premier, Józef Cyrankiewicz, became president and Gen. Franciszek Jóźwiak, chairman, both being members of the Politburo of the Polish United Workers' (Communist) party.

Veterinary Medicine.

Foot-and-Mouth Disease in Mexico.—The virulent epizootic of foot-and-mouth disease that broke out in the most congested livestock centre of Mexico in 1946 continued through 1949. Emissaries sent to Switzerland to study vaccine production established laboratories in Mexico which produced 1,500,000 doses of vaccine monthly, and a plan to vaccinate millions of animals three times a year was put into operation. Veterinarians in charge predicted reservedly that it would require two more years to bring the plague under a reasonable degree of control.

Q Fever.—Additional facts were published during 1948–49 about the rickettsial disease of man and animals, named Q fever for Queensland, Australia, where it was first identified as a specific infection. The disease was recognized in many widely separated parts of the world. Although seldom, if ever, diagnosed

CATTLE ROUNDUP in Equatoria, Sudan, prior to mass inoculations with antrycide, a vaccine developed by British scientists in the fight against cattle diseases. The vaccine became available in quantities in 1949 and was being tested against sleeping sickness; it was already known to be effective against rinderpest

clinically in farm animals, because of its mild nature, the disease concerned veterinary medicine because it is a grave human disease generally contracted by contact with farm animals, especially cattle. Q fever was proved to be chiefly an occupational disease affecting handlers of livestock and livestock products and consumers of raw milk derived from dairy herds exposed to dusty corrals.

The presence of the specific microbe found consistently in the dried excrement of insects and ticks indicted dust as one of the transmitting agents.

Ring Test for Bovine Brucellosis.—Because of the uncertainty of detecting the presence of the infection in every cow under all conditions, bovine brucellosis (Bang's disease or contagious abortion) continued to be a major problem of dairy cattle breeding and milk production. The new and simpler ring test developed in Denmark gained favour for collective eradication work during 1949. The test consists of adding one drop of hematoxylin-stained *Brucella* antigen with one cubic centimeter of the milk sample, shaking the bluish mixture well and incubating it for one hour at 37° C.

The diagnosis is made immediately after the incubation by reading the colour changes (ring) of the cream layer and of the milk beneath. The degrees of coloration indicate whether the animal is negative, suspicious, weakly positive, positive or strongly positive, and thus gives a clear insight to the extent of the infection in the herd without delay. Although the test had become useful for detecting the disease in individual cows its main purpose was testing the pooled milk of whole herds (from the milk cans) plus the pooled milk of each herd of a community set apart for area work on a large scale at minimum cost and effort and in the least possible time. Herds that passed three negative ring tests of milk made at intervals of four months and a blood test four months later were certified as brucellosis-free. Though widely discussed and generally approved, the ring test had not been officially sanctioned in the United States at the end of 1949.

International Veterinary Congress.—The 14th International Veterinary congress at London, Eng., in Aug. 1949 was devoted chiefly to the world's food supply which, admittedly, was becoming more and more precarious in the face of the multiplying populations, the inflexible acreage of arable land, soil erosion and diminishing returns and the mounting incidence of deficiency diseases among meat- and milk-producing animals.

Penicillin in Mastitis of Cows.—Although controlled trials and wide use of penicillin in treating bovine mastitis gave the drug a higher rating than the antiseptics (acridine dyes, oxide of silver, etc.) formerly employed, the results were lower than the original expectation. Evidence showed that cures might be expected in 83% of cases caused by *Streptococcus agalactiae* and 48% of those caused by *Staphylococcus aureus,* the two microbes commonly involved. Crude penicillin and sodium penicillin showed equal values. Directives on dosage and technique were lengthy.

X Disease.—During 1947–49, a noninfectious hyperkeratosis of cattle caused heavy losses in 32 or more states. Because of its unknown nature, the malady was named X disease. The mortality reported by the U.S. bureau of animal industry was 8%. More severe outbreaks investigated by the Texas agricultural experiment station caused a death rate approaching 100%. Although differing only in severity, the highly fatal form was named XX disease. Outbreaks occurred in widely separated places—Texas, Colorado, Florida, Virginia, New York, Wisconsin, *etc.;* the incidence for the whole country was not determined.

The new disease was an acute dermatosis with pronounced internal repercussions—fever anorexia, loss of weight and suppressed lactation. Associated with these systemic phenomena was an extensive keratosis. Among the suspected causes investigated were injurious plants, toxic soil, nutritional deficiencies, allergic reactions, fungi, bacteria, skin parasites, environment and DDT spraying of plants and animals. Reportedly, all these agencies had been excluded except the too free use of DDT sprays and powders.

Dosage of Phenothiazine in Horses.—The medicinal dose of phenothiazine, popular treatment against bloodsucking worm parasites in horses, was determined during 1949. Previously the imperial bureau of agricultural parasitology had indicated that this useful drug, for reasons unknown, was not as well tolerated by horses as by ruminants, and in the United States unaccountable fatalities from single doses were frequently reported. Dosage calculated on the basis of body weight as in lambs, calves and adult sheep and cattle was unsafe in the equine species both in single doses or in the low-level continuous dosage given ad libitum in the feed or salt lick of these ruminants. In Kentucky, where bloodsucking roundworms (*Strongylus, spp.*) remained a great menace to pastoral horses the safe, effective dose was established by the state experimental station by controlled trials in experimental horses of various ages. The single dose for adult horses is 30 g. and for weanlings and yearlings 15 g. In repeated doses 4 g. is given daily for 52 days for adults and 1 to 2 g. daily for 52 days was well tolerated for the younger animals.

Enterotoxaemia of Lambs.—An outstanding development was the evaluation of a vaccine for the prevention of pulpy kidney disease, or enterotoxaemia of lambs, which in recent years had been causing explosive death losses as high as 40% among lambs suddenly shifted from pasture to feed lot for fattening. The change from sparce to heavy rations was long known to be an aetiologic factor but the pathogenesis was not clear until pathologists of the Corn States Serum company's research laboratory working with pastoral and feeder lambs in Nebraska, demonstrated that *Clostridium perfringens,* Type D, a harmless inhabitant of the lower bowels, was capable of becoming dangerously virulent in lambs given free access to heavy grain rations too suddenly. The clue led to the production of an antiserum that confers a passive immunity and a bacterin (vaccine) that confers a permanent immunity beginning ten days after treatment. Extensive field trials since 1947 indicated that this grave infection is preventable.

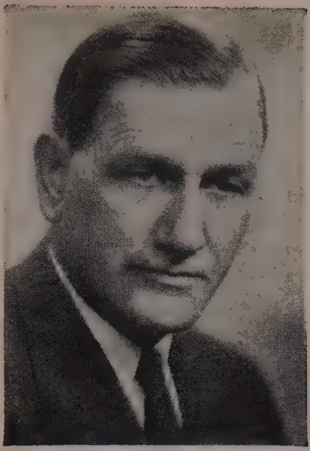
Virginia.

One of the 13 original states of the United States, Virginia is known as the "Old Dominion" and as the "Mother of Presidents." It is southernmost among the middle Atlantic states and has an area of 40,815 sq.mi., including 916 sq.mi. of water. Pop. (1940) 2,677,773, of which 35.3% was urban and 64.7% rural. On July 1, 1949, the bureau of the census estimated the state's civilian population at 3,102,000. Capital, Richmond (193,042 in 1940 and 232,000 in July 1948). Other major cities include Norfolk (144,332 and 170,000), Roanoke (69,287 and 71,000) and Portsmouth (50,745 and 57,200).



JOHN S. BATTLE, Democrat, elected governor of Virginia, Nov. 8, 1949

History.—The year 1949 saw steady progress in Virginia in the fields of public education, the care of the mentally diseased and improvement of the state's general health services. Special emphasis was devoted in the state's public school system to visual education techniques and to problems of vocational education. Under the sponsorship of Gov. William M. Tuck a $10,000,000 construction program was launched at the state's seven mental hospitals. The year was marked by four seizures of public utilities by the state under terms of the 1947 public utilities labour relations law, which permits the commonwealth to operate public service corporations that are threatened by strikes and other labour disputes. During the nationwide soft coal strike Governor Tuck exercised what he described as his "inherent powers" and seized a coal mine to provide fuel for state institutions and the general public. In December a legislative commission recommended sweeping changes in the state's tax structure to return a greater measure of governmental responsibility to the localities. At a Democratic primary election on Aug. 2, John S. Battle was nominated for governor by a plurality of 24,000 votes in a four-man race; he was elected governor at the general election in November to succeed Tuck on Jan. 18, 1950. Tuck was not eligible under the state constitution to seek re-election. L. Preston Collins was elected in November for another four-year term as lieutenant governor. G. Tyler Miller resigned on July 6 as superintendent of public instruction and was succeeded by D. J. Howard.

Education.—In 1948–49 elementary school enrolment was 442,611 with a teaching staff of 11,858; secondary school enrolment was 141,117 with a teaching staff of 5,113. The teaching staff also included 1,198 instructors in vocation education and 1,917 principals and head teachers.

Social Insurance and Assistance, Public Welfare and Related Programs.—For the year ended June 30, 1949, 10,131 persons received $1,169,638 in general relief; 20,986 received $4,040,021 in old-age assistance; 8,516 families with 24,683 dependent children $3,093,331; 5,746 under the regular foster care program $703,566; and 1,569 blind $410,941. In 1949, 709,441 checks representing 869,655 weekly payments were written for civilian unemployment compensation, amounting to $13,887,336. This was more than double the amount of such compensation in 1948. Also, in 1949, 2,666,935 checks representing 336,862 payments for war veterans readjustment allowances were written for $7,278,095.

The average daily population of six penal institutions for adults was 4,739 and of four industrial schools for juveniles was 600 at the end of the fiscal year in June 1949.

Communications.—On Jan. 1, 1949, there were 8,891 mi. of highway in the state's primary system; on July 1, 1949, there were 38,758 mi. in the secondary system. During the year ended June 30, 1949, the state spent $53,651,250 on its highways, down fractionally from the previous year's expenditures. The total railroad mileage was 4,087,569 on Jan. 1, 1949. There were 529,493 telephones in Virginia on Nov. 30, 1949.

Banking and Finance.—On June 30, 1949, Virginia had 184 state banks with 56 branches and 313 national banks and branches. On June 30, 1949, deposits in national banks were $1,014,101,000 and assets $1,103,956,000. On June 30, 1949, deposits in state banks totalled $720,966,189, and assets $789,189,428. Resources on Dec. 31, 1948, of 15 industrial loan associations were $11,206,837; of 55 building and loan associations $52,816,298; of 26 credit unions $1,755,708.

For the fiscal year ended June 30, 1949, the state treasurer received revenues of $291,920,194, about 6% more than in the previous year; expenditures were $307,668,834. The gross debt on June 30 was $13,114,699; there was no net debt, because a sinking fund of $14,858,281 left an excess of $1,743,582. The fiscal year ended with a cash general fund surplus of $33,136,853 plus an invested surplus of $42,484,800.

Agriculture.—The 1949 crop year was unusually favourable for Virginia's growing livestock industry, which in 1948 accounted for more than half the total farm income. Pasture and hay crops experienced their best year, and grain crops also returned high yields. A new record yield of corn, amounting to 47 bu. per acre, was established. Yields of tobacco and peanuts were less than average, and fruit crops encountered their second successive poor year. New records were set for milk and egg production, and the poultry industry reached new highs in production of turkeys and broilers. The value of principal crops was estimated at 12% less than in 1948, when production was placed at $303,347,000. Cash receipts to Virginia farmers in 1949 from farm marketings were estimated at 9% below 1948, when cash income (including government payments) amounted to $451,902,000.

Table I.—*Leading Agricultural Products of Virginia*

Crop	1949	1948	Average 1938–47
Corn, bu	53,580,000	50,525,000	36,520,000
Wheat, bu.	8,732,000	9,194,000	7,904,000
Oats, bu.	4,650,000	4,891,000	4,650,000
Rye, bu.	375,000	480,000	495,000
Barley, bu.	2,700,000	3,036,000	1,975,000
Buckwheat, bu..	105,000	126,000	118,000
Tobacco, all types, lb..	137,262,000	143,790,000	128,170,000
Peanuts for nuts, lb..	187,650,000	237,800,000	176,183,000
Hay, all tame, tons	1,800,000	1,823,000	1,490,000
Apples, commercial, bu.	7,820,000	8,240,000	9,664,000
Peaches, bu..	1,953,000	1,209,000	1,490,000
Cotton, lint, bales	20,000	24,000	22,000
Potatoes, bu.	9,126,000	11,529,000	8,808,000
Sweet potatoes, bu.	2,880,000	3,510,000	3,364,000
Soybeans for beans, bu..	2,106,000	1,749,000	994,000

Manufacturing.—The value of products manufactured in Virginia increased to a new record of $2,774,963,000 in the year ended Dec. 31, 1947, an increase of 192% over the 1935–39 average of $949,873,000. Wage earners received $396,844,000 in 1947 and total salaries amounted to $92,315,000. The average factory employment in 1948 was 235,600, more than 30% above the prewar level. A steady trend away from the rural economy and toward greater industrialization was evident over most of the state in 1949.

Table II.—*Principal Industries of Virginia*

Industry	Value of products 1947	Value of products 1946
Tobacco products	$895,813,000	$863,819,963
Food and kindred products	361,603,000	383,086,617
Textiles and their products	581,826,000	495,570,099
Wood products	166,190,000	138,608,354
Paper and printing	192,208,000	136,376,046
Chemical products	194,294,000	109,121,470
Metals and machinery	78,634,000	54,159,941
Leather and its products	46,062,000	35,824,735

Mineral Production.—The production value of raw mineral resources in the year ending Dec. 31, 1948, was placed at $157,724,000, an increase of nearly 20% over the preceding year. Coal production was valued at $118,309,000 in 1948, when 19,620,000 short tons were produced. Petroleum production declined in 1948 to 33,000 bbl. Principal ores mined during 1949 were zinc (valued at $4,224,000 in 1948), titanium and manganese.

FILMS OF 1949.—*Colonial Williamsburg, Virginia; Monticello, Home of Thomas Jefferson; Mt. Vernon, Home of George Washington* (World in Color Productions). (J. J. KT.)

Virgin Islands. The Virgin Islands have the status of an organized but unincorporated territory of the United States, located 1,400 mi. southeast of New York and 40 mi. east of Puerto Rico. The three largest islands with an area of 133 sq.mi. are St. Croix (pop. 13,000, est. 1947); St. Thomas (16,200) and St. John (800). The chief cities are Charlotte Amalie, the capital on St. Thomas (9,801), Christiansted (4,495) and Frederiksted (2,498) on St. Croix.

The governor of the Virgin Islands until Nov. 30, 1949, was William Henry Hastie; thereafter Hon. Morris F. de Castro, government secretary, and second ranking executive official, served as acting governor.

History.—The Virgin Islands depend upon the outside world for much of their essential food, clothing and materials. Until this unavoidable expenditure abroad is balanced by the creation of marketable wealth or value in the islands, the economic problem cannot be solved. Three approaches, each complementary to the other, were being made to this problem. These included the development of tourism as a major industry, the production of specialty crops for export and the promotion of new industry.

The $10,000,000 federal public-works program was considerably advanced during 1949. The abattoir at St. Thomas was completed and the potable water supply project nearly completed. Several miles of road had been reconstructed in St. Thomas and St. Croix. Work on the new water-front highway in St. Thomas was expected to begin early in 1950, along with the installation of improved telephone communication in both St. Thomas and St. Croix.

Education.—A total of $431,570 was expended for public education in the Virgin Islands during the fiscal year ending June 30, 1949. Of this amount, more than $100,000 was made available by the U.S. government, chiefly for the purpose of supporting the veterans' education program. Enrolment in the public schools in the Virgin Islands totalled 4,401 of which 2,752 were enrolled in St. Thomas and St. John and 1,649 in St. Croix. The average cost of education per pupil in the public schools was $82.97. This included the daily school lunch service. The average monthly salary per teacher in St. Thomas was $105.79, in St. Croix, $81.24.

Finance.—The revenues of the municipality of St. Thomas and St. John during the fiscal year 1949 were $800,996, compared with $817,581.92 for the fiscal year 1948. Budget expenditures totalled $1,051,960 compared with $965,733 for the previous fiscal year. Income-tax collections decreased from $417,698 for 1948 to $324,748 for 1949.

For the municipality of St. Croix revenues were $328,007, an increase over the 269,474 for the previous year. Budgeted expenditures were $656,620. Congress appropriated $520,200 toward the expenses of local government in the two municipalities of the Virgin Islands. Income-tax collections in St. Croix amounted to $65,444 as against $103,069 for the previous year.

Trade and Communication.—A total of 298 commercial ships with a gross tonnage of 1,603,374 entered the port of St. Thomas during the fiscal year 1949, compared with 417 ships and a gross tonnage of 2,435,760 in 1948. During the calendar year 1948 goods valued at $9,465,562 were imported into the Virgin Islands compared with $9,031,743 for 1947. At the same time the value of exports decreased from $2,183,744 for 1947 to $1,698,037 for 1948.

The Pan American Airways and Caribbean Atlantic Airlines serve the islands with regular flights. There are good roads in St. Thomas and St. Croix and a few miles of roads in St. John. Radio-telephone service is available between the three islands and to continental United States.

Industry.—During 1949 two more small hotels were opened in St. Thomas.

About 386,915 proof gallons of alcoholic beverages were exported, compared with 224,236 proof gallons in 1948.

St. Croix produces the sugar crop of the islands. In 1949 the government-owned Virgin Islands company produced 4,579 tons of sugar, a slight increase over the previous year's yield. (M. F. DE C.)

Vishinsky, Andrei Y. (1883–), soviet government official, was born at Odessa. He studied law at the University of Kiev and started his political activity in 1902 by joining the menshevist wing of the Social Democrats. When the bolshevists took power in 1917, Vishinsky deserted the menshevists, served in the Red army for a year and joined the Communist party in 1920. Appointed attorney general of the R.S.F.S.R. (Russian Soviet Federated Socialist Republic) in 1923, he became professor of jurisprudence at Moscow university two years later. He was appointed people's commissar for justice in 1927, all-union deputy public prosecutor in 1933 and public prosecutor from 1935 to 1939 during the period of the ruthless liquidation of the anti-Stalinist opposition inside the All-Union Communist party. On March 31, 1940, Vishinsky was appointed vice-chairman of people's commissars. On Sept. 7, 1940, he became deputy commissar for foreign affairs. Vishinsky represented the U.S.S.R. in the Allied Mediterranean commission (1943–45) and, from the Potsdam conference onward, attended virtually all the important inter-Allied and United Nations meetings.

On March 4, 1949, he succeeded Vyacheslav M. Molotov as minister of foreign affairs. He took part in the Paris session of the Council of Foreign Ministers (May 23–June 20, 1949) and was the head of the soviet delegation at the 4th U.N. general assembly at Flushing Meadow, L.I., N.Y. Speaking at a meeting of the U.N. political committee on Nov. 10 he said that the U.S.S.R. was using atomic energy for such peaceful purposes as razing mountains and irrigating deserts.

Vitamins. A report from the clinic of Randolph West of New York city cited 11 patients with pernicious anaemia, all of whom showed complete haematologic remission (recovery) following treatment with vitamin B_{12}. Five patients with the neurologic lesions of "combined system disease," often associated with this kind of anaemia, likewise showed marked improvement. Thus it seemed established that vitamin B_{12} is a completely effective therapeutic agent for pernicious anaemia.

Much was learned of the function of pyridoxine (vitamin B_6) in lower animals. Various claims were made for the usefulness of this vitamin in a variety of clinical conditions, such as muscular weakness, epilepsy, acne, nausea, vomiting of pregnancy and postradiation sickness. Evaluation and interpretation of these claims, as evidence for the occurrence of pyridoxine deficiency in man, were difficult and left much to be desired at the end of 1949.

Two papers described the chemical effects of pyridoxine on metabolism in man. It was significant that both papers were concerned with evidence for an influence of pyridoxine on protein metabolism and that both lines of evidence illustrated extensions to the human being of principles uncovered by investigations on lower animals, including the dog.

The first of these reports, by W. J. McGanity, E. W. McHenry, H. B. Van Wyck and G. L. Watt of Toronto, Can., was concerned with the effect of pyridoxine on blood urea concentration of women who exhibited severe nausea and vomiting during the first trimester of pregnancy. Following the lead from studies on animals, McGanity *et al.* determined the blood urea concentration in a series of healthy, nonpregnant women who were maintained on a constant protein intake, in a group of 40 healthy pregnant women, and in a group of 17 pregnant women exhibiting severe nausea and vomiting during the first trimester of pregnancy.

Oral administration of pyridoxine on each of three successive days did not alter the fasting urea levels of the healthy group but was followed by an increase in blood urea level of the patients with vomiting. These workers suggested that their results might be interpreted as presumptive evidence of pyridoxine deficiency in cases of nausea and vomiting of pregnancy.

The second paper, dealing with metabolic effect of pyridoxine in man, was a preliminary note by L. D. Greenberg, D. F. Bohr, H. McGrath and J. F. Rinehart of the University of California medical school which presented evidence that a load test of the amino acid, tryptophan, results in excretion of greatly increased amounts of an intermediate, xanthurenic acid, in human subjects on a pyridoxine deficient diet. These workers pointed out that their results demonstrated that man responds to pyridoxine deprivation in a manner similar to that of the mouse.

The need for extending these two important observations on metabolic effects of pyridoxine in man was obvious. In addition, it had become extremely important to search for evidences of metabolic derangements in the several clinical conditions for which responses to pyridoxine administration had been claimed.

One of the most intriguing problems in medical science continued to be the study of the cause, or causes, of cardiac failure. Approaches had been made from many angles, but to the end of 1949 the exact mechanism taking place in the cardiac muscle was not entirely known.

One approach to the problem had been the study of cardiac changes in various nutritional deficiencies. In rats fed a diet low in potassium, damage of the heart fibres results. Severe arterial and heart injury may also result from choline or vitamin B_6 deficiency in rats. Injury to the heart in pigs that had died of thiamine deficiency was also reported. In biochemical studies of hearts of guinea pigs with avitaminosis E, it had been reported that vitamin E was important in metabolism of the heart muscle. While studying the role of vitamin E in the nutrition and reproduction of cattle it was noted that cattle fed vitamin E-free rations throughout their entire life might die suddenly without evident cause. In one of the animals studied, the electrocardiogram showed abnormal changes, and microscopic studies of the heart revealed changes.

These studies of nutrition in relation to the heart muscle were stimulating, but even a cursory study soon revealed that many more experimental studies were necessary before definite conclusions could be drawn relative to human conditions. It was reported, without satisfactory supporting data, that vitamin E was beneficial in patients with coronary heart disease. These preliminary reports were not confirmed by other workers —rather, the evidence was contrary to the original claims. In one study of 22 patients treated, 11 had congestive heart failure and 5 had angina pectoris; the remaining 6 had hypertension or arteriosclerotic heart disease or both, without failure or angina. These patients were given 300 to 400 mg. of vitamin E daily in divided doses. Then the patients were followed about three to six months and electrocardiograms were made at intervals of two to four weeks. Six of the 22 patients were very questionably improved and the remainder showed no change or they became markedly worse.

The incidence of vitamin deficiency in the general population of the United States continued to be a much debated subject with few facts to support the debate. Of considerable interest, therefore, was a report by W. B. Bean, R. W. Vilter and M. A. Blankenhorn, who had made a continued effort over a period of more than 13 years to diagnose all cases of pellagra admitted to the Cincinnati General hospital.

Their figures revealed a startling decline in the incidence of this disease beginning in about 1939 and continuing for ten years. An attempt was made to correlate this decline with various factors such as food rationing, alcohol consumption, bread enrichment, nutrition education and popular consumption of vitamin preparations. None of these seemed to have initiated the trend although some may have helped to perpetuate it. There was a good inverse correlation between the incidence of the disease and the general economic level of the population. It would seem a fair assumption that ability to purchase a more adequate diet was the principal factor initiating the virtual disappearance of this disease. Vocational Rehabilitation, Office of. Physically and mentally handicapped civilians of working age requiring vocational rehabilitation services in order to obtain or retain employment commensurate with their potential capacities numbered at least 1,500,000 in the U.S. in 1949, not including veterans of the armed forces with service-incurred disabilities. The number is virtually static by reason of about 250,000 persons disabled each year so severely as to require rehabilitation. All 48 states, the District of Columbia, Puerto Rico and Hawaii maintained partnership with the Federal Security agency's office of vocational rehabilitation to provide the necessary services and facilities. Territorial funds were lacking to carry out Alaska's federally approved plan of operation.

There were during the year 51 general rehabilitation agencies administered by the state or territorial boards of vocational education through divisions of vocational rehabilitation. In addition, in 35 states and territories, there were separate agencies authorized by law to provide vocational rehabilitation services for blind persons. In 17 states general rehabilitation agencies provided services for the blind as well as for other types of handicapped clients.

The states and territories actually operated the programs, purchasing rehabilitation services from existing facilities and necessary medical care from general practitioners, specialists, clinics, hospitals and other sources, either public or private, available in the communities. The federal government, through the office of vocational rehabilitation in the Federal Security agency, assisted the states and territories through financial grants-in-aid, establishment of standards of service and technical aid. The federal government assumed all necessary administrative costs incurred by the states as well as their expenditures for guidance and placement of disabled individuals. Medical examinations and treatment, training and the costs of other services were shared equally by the states and the federal government.

From July 1943 through June 1949, a total of 277,059 disabled men and women were rehabilitated by the state-federal program to qualify for, to take and to perform useful work. This figure compares with a total for the preceding 23 years of 210,125 under limited legislative authority. On an average yearly basis, program gains during 1944–49 represented an increase in successful rehabilitations of more than 400% over the figure for the previous 23 years.

For the year ended June 30, 1949, 69,277 disabled people were prepared for and placed in suitable employment. Of these, the number performing their jobs to their own satisfaction and that of their employers was 58,020, an increase of 9% over fiscal 1948. The remaining 11,257 had completed their rehabilitation to the point where they were employed but were being observed for a reasonable period to make certain that their adjustment would be complete. This represented a 22% increase over the previous year. During fiscal 1949, 3,166 blind persons and 3,895 persons with other visual defects were rehabilitated into suitable employment. All of these figures represented record highs for one year.

For the fiscal year 1949, the annual rate of earnings for the rehabilitated group upon application for services—approximately $18,000,000—rose to $97,000,000 during the first year after rehabilitation, an increase of approximately 400%. The post-rehabilitation earnings did not include those of about 7,700 rehabilitants who were engaged in farming or family work and whose earnings were not reported.

Thirteen thousand of the successful rehabilitants during 1949 were employed at the time they applied for services but required rehabilitation for one of the following reasons arising from their disabilities: they were in danger of losing their jobs; were in jobs that were hazardous to them or to their fellow workers; were working only part time; or were in otherwise unsuitable employment. (*See* also MEDICAL REHABILITATION OF THE DISABLED; VETERANS' ADMINISTRATION [U.S.].) (M. J. SY.)

Wages and Hours.

Total wage payments in the United States declined 8.75% from Sept. 1948 to Sept. 1949, as measured by pay rolls in manufacturing industries. This compared with an almost equal decrease in manufacturing employment (8.3%) in the same period and constituted a return to the employment and pay roll levels of 1947. Total employers' disbursements, including salaries and wages, amounted to $11,417,000,000 in Sept. 1949, or 0.49% less than for the same month in 1948.

"NERVOUS CATS," a 1949 cartoon by Herblock which appeared in the *Washington Post*

Table I indicates the trend of real wages in 1949 as compared with 1948. Based upon 1949 averages, the index of real wages in Sept. 1949 was 136.5—equal to the peak month of the previous year. Average real wages for the first nine months of 1949 were 4.3% above the comparable months for 1948, reflecting a slight drop only during the "business recession" of the spring months.

Coal miners lost their position as recipients of the highest "take-home pay." Those classified as workers in products of coal and petroleum earned a weekly average of $72.04 in 1949. Building construction workers received a weekly average of $71.91, while one subdivision of construction workers—plasterers and lathers—received $83.13. The lowest weekly payments were made to hotel employees ($32.94), but this figure did not represent total earnings for that group, for it did not include tips, room, board or uniforms. Employees in tobacco processing plants were second lowest, with $38.63.

Data in Table II indicate that average weekly earnings increased in slightly more than half of the recorded industries, but weekly earnings for manufacturing industries as a whole declined approximately 1%. Wages were slack in durable goods industries, but somewhat improved in nondurables. Average

Source: *Monthly Labor Review*, United States bureau of labour statistics.

earnings exceeded $50 per week in approximately 69% of the classified industries in 1949 as compared with 71% in 1948. Average weekly pay was greater than $60 in 28.1% of the industries in 1949 as against 45% in the preceding year. This is partly accounted for by an average reduction of one hour in the manufacturing work week.

The greatest increase in take-home pay was that of 6.6% in the telephone industry. The 5.6% increase in the printing and publishing industry was second in size. The greatest drops in weekly earnings (anthracite and bituminous coal mining) were attributable principally to loss of working time through strikes.

The greatest hourly increase was also in the telephone industry—12.6%. The only declines in hourly wage rates were in coal and metalliferous mining and in apparel manufacturing. The average rate of increase in hourly wages slowed down from 9.1% in 1948 to 1.8% in 1949.

Table III shows shifts in hourly earnings in selected industries over a five-year period. The net increase for all manufacturing industries was 37.6%, while the greatest proportionate increase was 65.9% in the textile industry. The smallest change was in tobacco products industries.

The July 1949 average hourly rate for common labour (in road building) was $1.16, compared with $1.04 in 1948 and 47 cents in 1941. Farm wages in July 1949 averaged 74 cents per hour not including board. The 1948 farm wage was 78 cents.

Table III.—*Rise in Hourly U.S. Earnings Rates*

(August rates)

Industry	1944	1945	1946	1947	1948	1949	Index, 1949 (1941=100)

Source: Compiled and computed from data in *Monthly Labor Review*, United States bureau of labour statistics.

Compared with 1948, 1949 was a year of considerably greater stability. Hourly wages continued their upward trend, with the slight decline in average weekly earnings attributable to a reduction in the length of the work week. In conjunction with price trends, the net effect was an increase in real wages.

(D. J. H.)

Great Britain.—Meeting early in September, before devaluation of the pound sterling was announced, the British Trades Union congress reaffirmed its support for the policy of restraint in wage claims; and the general council reasserted this attitude with increased insistence after devaluation had been made public. At this time a number of the principal trade unions had important wage claims under negotiation, including the Confederation of Shipbuilding and Engineering unions and the Civil Service Clerical association. The National Union of Railwaymen had just had its claim for an all-round advance rejected by the special tribunal to which it had been referred and there was talk of strike action, or of a "work to rule" movement; but the delegate conference of the union decided to limit its action for the present to a renewed demand for an improvement in wage rates for the lowest paid grades, for which an offer had actually been made by the British Railways executive before the major issue was referred to the tribunal.

During the first eight months of 1949 wage changes were less than during the corresponding months of 1948. The principal groups to receive advances were the agricultural workers, the cotton operatives, the postal workers and the building trades. The total advances recorded in the official statistics up to the end of August amounted to £765,000 a week spread among 4,415,000 workers, as compared with £1,219,000 and 4,848,000 workers in the corresponding months of the previous year. There were no important changes in standard hours of work. The official index of wage rates (June 1947=100) stood at 109 in Aug. 1949, as against 106 a year previously.

For weekly earnings, as distinct from wage rates, the latest current figures were for April 1949. For the trades covered by the returns the over-all average was 119*s.* 4*d.*, as compared with 114*s.* in April 1948 and 53*s.* 3*d.* in Oct. 1938, which is used as the *datum* line for reckoning the percentage changes since the beginning of World War II. This gives a rise of 124% in April 1949, and of 114% a year earlier. Over the same period, average hours worked (including overtime) had fallen from 46.5 in Oct. 1938 to 45.3 in April 1949 and the same a year earlier. The reduction in actual hours worked was substantially less than the reduction in the standard working week, as more overtime was being worked. Most trades in 1949 were working a five-day week, with overtime, except where special reasons existed for weekend work. These statistics of wages and hours did not include agriculture, coal mining, railways or the distributive trades, and covered only a minority of transport workers. They were, however, sufficiently representative of manufacturing industries and of most public utility services.

These general averages conceal both the differences between skilled and less skilled workers and the differences between industries. In all occupations there was a considerable narrowing of the real differentials paid for the more skilled work, especially under time-work conditions. This was mainly the effect of flat-rate advances to all workers in an industry irrespective of skill. In pieceworking occupations some, but by no means all, skilled workers were able to increase their earnings enough to offset the decline in relative margins as measured by wage rates; but in some cases less skilled workers were able to increase their earnings more easily than the more highly skilled. There was considerable discontent among a number of groups of highly skilled time-workers, including supervisory grades, where their earnings fell below those of pieceworkers ranking below them in the traditional hierarchies.

In April 1949 the industries recording the highest average earnings were, for adult men, automobile manufacture and newspaper printing (both 170*s.*), and for women, passenger road transport (108*s.*) and automobile manufacture (97*s.*). The lowest earnings were, for men, in linen and jute (108*s.*) and local authority industrial services (114*s.*), and for women, in linen (61*s.*) and laundries (66*s.*). For men, the great majority of industries fell within the range 148*s.*—127*s.*, and for women, within the range 80*s.*—70*s.* After devaluation there was some talk of instituting a minimum wage of 100*s.* a week for adult men, with a lower minimum for women workers; but this, if it meant a minimum *rate* of 100*s.* for the standard working week, would involve a very considerable rise in the total wages bill. In engineering, relatively well paid, the bottom rate was only 92*s.* and on the railways the average for a number of the lowest grades was 92*s.* 6*d.* (*See* also AGRICULTURE; BUSINESS REVIEW; CENSUS DATA, U.S.; LABOUR UNIONS; PRICES.) War Crimes.

Western Europe.—The most important war crimes trial of 1949 ended April 14, when a United States tribunal at Nuernberg found 19 of 21 nazi former ministers and government officials guilty of planning aggressive war, war crimes and crimes against humanity. The sentences in this so-called "Wilhelmstrasse trial," which had proceeded for 17 months, ranged from 4 to 25 years in prison but time already spent in captivity was to be deducted from the terms. Otto Meissner, chief of the presidential chancellery, and Otto von Erdmannsdorff, ambassador to Hungary, were acquitted. Found guilty were Gottlieb Berger, chief of the SS main office; Edmund Veesenmayer, reichsminister plenipotentiary; Hans Lammers, chief of the reich chancellory; Hans Kehrl, chief of the armaments and war production planning office; Paul Koerner, Hermann Goering's deputy for the four-year plan; Paul Pleiger, chairman of the reich coal association; Lutz von Schwerin-Krosigk, reich finance minister; Wilhelm Keppler, Adolf Hitler's special economic adviser; Ernst Woermann, ministerial director of the political division of the foreign office; Richard-Walther Darré, food and agricultural minister; Otto Dietrich, state secretary of the propaganda ministry; Karl Rasche, head of the Dresdner bank; Gustav Steengracht von Moyland, state secretary of the foreign office, Ernst von Weizsaecker, ambassador to the Vatican; Walter Schellenberg, chief of the combined military intelligence service and SS official; Ernst Wilhelm Bohle, chief of the nazi party's foreign organization; Emil Puhl, vice-president of the Reichsbank; Karl Ritter, ambassador for special assignments; and Wilhelm Stuckart, state secretary, ministry of the interior.

The report of the United States military government in Germany for April 1949 described this trial as the "last of the Nuremberg War Crimes Cases." U.S. war crimes tribunals in Europe had tried 1,873 persons, of which 459 had been sentenced to death, 1,110 to prison and 304 acquitted.

The British government announced on May 5 that the charges against Field Marshal Karl von Rundstedt and Gen. Adolf Strauss would be dropped, but Field Marshal Erich von Manstein would be tried. There would be no further war crimes trials in the British zone. No application for extradition of war criminals had been accepted since Sept. 1, 1948, and none for traitors and collaborators since March 1, 1949. British war crimes tribunals in Germany had tried 937 persons, of which 230 had been sentenced to death, 447 to prison and 260 acquitted. The trial of Otto Abetz, German ambassador to the Vichy government, by a French military court resulted in his sentence to 20 years' hard labour on July 22. German courts were henceforth to be responsible for trials of crimes against humanity in western Germany whether involving German, Allied or United Nations persons.

Far East.—The Far Eastern commission decided on Feb. 24 that there would be no further international military tribunals in the far east and recommended on March 16 and 31 that any further war crimes trials in national tribunals be decided upon by the end of June and concluded if possible before the end of Sept. 1949. The United States state department announced on Jan. 13 that the 11 former enemies of Japan, including the U.S.S.R., had agreed in 1945 to exempt the Japanese emperor from trial for alleged war crimes. The trials of Adm. Soemu Toyoda, chief of the Japanese naval staff, ending in his acquittal on Sept. 6, 1949, and of Osamu Satano, sentenced on Oct. 19, 1949, to five years' imprisonment for beheading, under orders, a captured U.S. flyer, were the last U.S. trials in the far eastern area. Gen. Douglas MacArthur announced the end of war crimes trials on that date saying 4,200 Japanese had been convicted by seven allied nations in the far eastern area and 720 had been executed. About 100,000 suspects had been questioned.

Eastern Europe.—In some cases in eastern Europe, war crimes charges appear to have been mixed with charges of conspiracy and espionage against the local government. This was true of the trial in Hungary of former Hungarian Minister of the Interior Laszlo Rajk and seven others, resulting in confessions and sentencing of the accused in Sept. 1949. This trial resembled that of Joseph Cardinal Mindszenty and others in Hungary and of 15 pastors in Bulgaria on similar charges during the winter of 1949, and of members of the Social Democratic Youth organization in the soviet section of Berlin in June 1949 for distributing a paper with "slanderous attacks on the Soviet Union." The Hungarian and Bulgarian proceedings and similar proceedings in Rumania were protested by western powers on the ground that they were conducted in a way to violate civil liberties guaranteed in the peace treaties with those countries. The United Nations general assembly asked in Oct. 1949 for an advisory opinion of the International Court of Justice on the applicability of the procedures specified in these treaties.

These trials had in reality no more to do with war crimes than did the sentencing of F. Klecka for 20 years by a U.S. military court in Munich, Ger., in Feb. 1949 with lesser sentences to others in a Czechoslovak spy ring, and the sentencing for three months of Max Reimann, Communist leader of West Germany, by a British tribunal at Duesseldorf in February 1949 for violent speeches against occupation policy. The latter sentence was questioned in the British parliament on the ground that it curtailed freedom of speech and by the German constitutional convention, then meeting in Bonn, of which Reimann was a member. The case became ironic when Reimann's son escaped from the soviet zone to enjoy freedom in the western zones. While trials for espionage and sabotage against military governments, and for sedition and treason against national governments, would doubtless continue, trials for war crimes, in the sense used in the Nuernberg charter, had by the close of 1949 come to an end as far as World War II was concerned.

Statistics of Trials.—The United Nations War Crimes commission had by 1949 completed its work begun in 1943. It had published 15 volumes of *Law Reports of the Trials of War Criminals.* The final volume analyzes the law and procedure in the 89 cases reported and 92 cases cited in this series. These cases were selected from 1,911 trial records received by the commission. The commission also published its own history with statistical data and critical analyses of the law and procedure developed in its own work and the work of the tribunals. The war crimes tribunals of the United States, Australia and western European countries held more than 2,000 trials about equally divided between the European and far eastern areas. These trials involved more than 6,000 persons resulting in about 1,500 death sentences, 3,500 prison sentences and 1,000 acquittals. Data on trials by the eastern European countries and China were lacking, but the numbers were probably no less. More than 10,000 persons of the axis powers were tried for war crimes and probably 80% were found guilty. The United Nations War Crimes commission examined more than 8,000 charges involving 36,000 persons and issued lists of more than 20,000 persons which it thought should be tried. These lists were probably incomplete and many listed were never tried. Lord Wright of Durley, chairman of the United Nations War Crimes commission, expressed the opinion that if 10% of the actual war criminals were tried, the results would not be unsatisfactory. (*See* also INTERNATIONAL LAW.)

Washington.

A state in the extreme northwest United States, popularly known as the "Evergreen state," Washington was admitted to the union Nov. 11, 1889. Total area: 68,192 sq.mi., of which 66,977 sq.mi. are land; pop. (1940): 1,736,191; native 1,525,812; foreign born 210,379; urban 921,969. An estimate as of July 1, 1949, by the U.S. census bureau placed the population of the state at 2,582,000, an increase of 48.7 since 1940. Capital: Olympia, 16,300 (est.). The 1940 census and 1949 estimates for the three largest cities were, respectively: Seattle, 368,302 and 488,980; Spokane, 122,001 and 170,000; Tacoma, 109,308 and 150,750.

History.—In 1949 the 31st legislature of the state of Washington, the senate of which was Republican and the house, Democratic, enacted new administrative codes in the fields of fisheries, game, game fish, fluid milk and fluid milk products. New administrative agencies created by the legislature were a state power commission, a public service commission (replacing the department of transportation and public utilities), a department of fisheries and a marine employee commission. Authorized by constitutional amendment approved by the electorate in 1948, the legislature increased the salaries of elective state officers. Persons who were members of Communist or fascist organizations were made ineligible for temporary permits to teach in the state. The state superintendent of public instruction was instructed to prepare the proper oath or affirmation to be tendered applicants for such permits. All of the state-supported universities and colleges were authorized to train teachers for all public schools, but only the University of Washington, Seattle, and the State College of Washington, Pullman, were to grant superintendent certificates. The colleges of education were empowered to grant the degree of Master of Education.

GROUND FISSURES in Seattle, Wash., caused by the earthquake which rocked the Pacific northwest, April 13, 1949, causing the death of 8 persons as well as severe property damage

The state's first comprehensive Fair Employment Practices act was enacted. Physicians, dentists and similar professional persons were forbidden to pay or receive "rebates, or refunds, or unearned discounts."

The state supreme court reaffirmed a previous decision denying school districts the authority to transport children to parochial schools in public school district school buses.

On April 13, 1949, western Washington, particularly the Puget sound area, experienced the worst earthquake shocks in its history.

The chief state officers for 1950 were: governor, Arthur B. Langlie; lieutenant governor, Victor A. Meyers; secretary of state, Earl S. Coe; treasurer, Tom Martin; auditor, Cliff Yelle; attorney general, Smith Troy; state superintendent of public instruction, Pearl Wanamaker (elected on nonpartisan basis); state commissioner of public lands, Jack Taylor; state insurance commissioner, William A. Sullivan.

Education.—During the school year 1948–49, total enrolment in public schools was 392,273 and average daily attendance was 343,211. The total certified personnel numbered 15,359 and the average salary was $3,384.66. Total current operating expenses were $84,986,541.55. A total of 1,478 schools were maintained in 605 districts. There were slight decreases in the enrolments at the University of Washington and at the State College of Washington, but increases at the three colleges of education.

Social Insurance and Assistance, Public Welfare and Related Programs.—During the period Oct. 1948 through Sept. 1949, inclusive, public assistance in the state, including federal direct expenditures and state aid, cost $96,783,234.40. An average of 137,389 persons received assistance to the total amount of $92,964,261.42. An average of 28,278 received general assistance to the amount of $11,077,724.31. A total of $12,681,464.26 was spent on health care. An average of 70,381 old persons received a total of $51,837,800.99. An average of 38,349 children received a total of $16,728,843.40. An average of 795 blind persons received a total of $638,655.57. During the last months of 1949 the state director of social security tried to reduce welfare payments, except those to the blind, below the amounts authorized by law. His reason was inadequate funds. A decision of the superior court of Thurston county invalidated the reductions planned for 1949.

On Oct. 31, 1949, ten state charitable institutions had a total population of 10,372 and four correctional institutions had 2,168 inmates. Both programs cost the state $18,010,257.65 during the fiscal biennium of April 1, 1947, to March 31, 1949.

Communications.—Railroad mileage for the state was 5,227 in 1946. The total mileage of primary and secondary state highways of the state was 6,384.35 in 1949; the total mileage of roads on the federal-aid highway system was 9,712.15 (overlap state and county roads); state highways not receiving federal aid amounted to 442.27 mi.; the total mileage outside the corporate limits of cities and towns was 5,983.62. From Jan. 1, 1949, to Sept. 30, 1949, the state spent $14,060,786.88 for highway construction. On Jan. 1, 1948, there were 605,307 telephones in the state.

Banking and Finance.—In 1949 real and personal property assessed for purposes of taxation amounted to $1,898,642,513. On March 31, 1949, the bonded indebtedness of $660,000 and outstanding warrants amounting to $9,371,499.84 were covered by investments and cash balances. The treasurer's cash balance was $93,210,399.58. For the year ending March 31, 1949, total receipts were $280,387,211.31 and disbursements were $308,587,280.92. Cash transfers were $66,205,917.77.

On June 30, 1949, 124 banks in the state reported a total capital of $41,830,700; capital surpluses and undivided profits of $107,902,246; deposits of $2,012,991,833; and total assets of $2,144,107,079.

Agriculture.—In 1945 the state had 79,887 farms, whose acreage totalled 16,719,870, and of these, 4,207,000 (est.) were in 1948 devoted to 52 crops. In 1948 agricultural production was valued at $657,704,000. Field crops accounted for $258,168,000; fruits, nuts and berries $113,066,000; vegetables $20,579,000; livestock and livestock products $244,810,000; and specialties $21,081,000. The total farm value of crops for 1949 was estimated at $600,000,000.

Table I.—*Leading Field and Fruit Crops of Washington*

Crop	1949	1948	Average, 1938–47
Wheat, bu.	57,511,000	79,268,000	57,787,000
Apples, bu.	31,820,000	25,760,000	28,034,000
Hay (all), tons	1,571,000	1,759,000	1,773,000
Potatoes, bu.	10,080,000	12,600,000	8,449,000
Pears, bu.	7,300,000	5,555,000	7,227,000
Hops, lb.	19,370,000	22,704,000	15,086,000
Peas (100-lb. bags)	1,583,000	1,950,000	2,850,000
Strawberries (crates)	920,000	980,000	
Oats, bu.	6,815,000	6,290,000	7,480,000

Manufacturing and Trade.—In 1948 total income payments to persons in the state amounted to $3,578,000,000 in contrast with $3,345,000,000 in 1947 and $1,100,000,000 in 1940. Average per capita incomes for 1947 and 1948, respectively, were $1,534 and $1,536. In 1947 there were 3,410 manufacturing establishments employing a total of 144,324 persons, who were paid a total of $438,020,000. An average number of 123,488 production workers were employed for 237,418,000 man-hours, and received a total of $354,596,000 in wages. The value added by manufactures was $874,036,000.

Table II.—*Principal Industries of Washington*

Industry	No. of establishments	Value
Lumber and lumber products (except furniture)	911	$279,458,000
Food and kindred products	752	148,904,000
Paper and allied products	63	137,670,000
Transportation equipment	130	76,579,000
Primary metals industries	62	63,319,000
Printing and publishing	401	42,680,000
Fabricated metals	198	26,719,000
Machinery (except electrical)	181	25,233,000
Stone, glass and clay products	167	17,203,000
Chemicals and allied products	115	15,570,000

The output of lumber in 1948 was 3,627,000,000 bd.ft., and of plywood, in which the state leads in production, was 1,964,000,000 sq.ft.

In 1948 commercial fisheries reported a total production of 136,474,360 lb., which had a value of $22,187,690 to fishermen.

Mineral Production.—Mineral production, which in 1946 amounted to $33,076,000, was estimated at $40,000,000 for 1947 and $50,000,000 for 1948. The total value of the leading metals was $7,313,398 in 1947 and $11,171,715 in 1948. In 1948 the state's 623 mines, pits and quarries employed from 2,200 to 2,600 workers per month and had a pay roll of $8,500,000 for the year. (H. J. De.)

Table III.—*Production of Leading Metals of Washington*

Metal	Amount, 1948	Value, 1948
Zinc	25,276,000 lb.	$3,361,708
Lead	14,294,000 lb.	2,558,626
Copper	11,330,000 lb.	2,458,610
Silver	375,831 oz.	340,146
Gold	70,075 oz.	2,452,625

Washington,

DISTRICT OF COLUMBIA, national capital of the U.S.A., covers the entire District of Columbia, which was originally 100 square miles until in 1846 congress ceded back to Virginia the area lying south of the Potomac river. During World War II and postwar years the population spread in increasing numbers into Maryland and Virginia. Many federal buildings, including the famous Pentagon, were located outside the District lines. The comprehensive plan of Washington, which was to be completed in 1950, treats the entire region. Legislation pending at the close of 1949, which had passed the senate, would enlarge the National Capital Park and Planning commission to include members appointed by the governors of Maryland and Virginia, and would bring all plans for public buildings and grounds before the commission at an early stage.

As a feature of the sesquicentennial, marking the 150th anniversary of the occupation of Washington as the seat of the national government, the American Institute of Architects and the American Planning and Civic association were to meet in Washington in May 1950, with the Joint Committee on the National Capital, composed of nine national professional and civic organizations co-operating. A planning exhibit of the comprehensive plan was to be shown by the National Capital Park and Planning commission.

During 1949 enough apartment buildings were completed or under construction to bring some relief to the housing congestion in 1950. The Pan American office building on Constitution avenue was completed in 1949. The White House had been dismantled and was being rebuilt.

The budget for the District of Columbia, year ending June 30, 1950, amounted to $110,000,000, of which about $15,000,000 was for city improvements. The budget for the year ending June 30, 1951, was estimated at $118,000,000, of which $20,000,000 would be for improvements. During 1949 a sales tax of 2% on many commodities went into effect. About $4,000,000 was collected in four months. The estimated total for 1950 was $14,000,000.

A bill was introduced into the 81st congress to provide for a constitutional amendment under which the residents of the District of Columbia would be permitted to vote for representation in congress, which, under the constitution is responsible for all legislation for the District of Columbia.

Wealth and Income, Distribution of.

A survey of consumer finances in the United States, published in 1949 by the board of governors of the federal reserve system, supplied information on the distribution of income in 1948 and liquid assets in early 1949. Three previous surveys had made similar information available for the period 1945–47. The surveys were based on small field canvasses of consumer spending units, defined as all persons living in the same dwelling and related by blood, marriage or adoption who pooled their incomes for their major items of expense.

Survey data on the percentage distribution of spending units according to size of holdings of liquid assets—U.S. government bonds, savings accounts and checking accounts—are provided in

Table I.—*Distribution of Spending Units by Size of Liquid Asset Holdings*

Amounts of liquid assets held*	(Per cent) 1946	1947	1948	1949
None	24%	24%	27%	29%
$1–$199	15	14	15	16
$200–$499	14	12	13	13
$500–$999	14	14	12	11
$1,000–$1,999	14	14	12	11
$2,000–$2,999	7	7	6	5
$3,000–$4,999	6	7	6	7
$5,000–$9,999	4	5	5	5
$10,000 and over	2	3	4	3
All units	100%	100%	100%	100%
Median holdings of all units	$400	$470	$350	$300
Median holdings of those with assets	$750	$890	$820	$790

*Includes all types of U.S. government bonds, checking accounts and savings accounts in banks, postal savings and shares in savings and loan associations and credit unions. Excludes currency holdings. Data for 1949 do not include shares in credit unions, but these are relatively small in the aggregate and not likely to affect totals significantly.

Source: Board of Governors of the Federal Reserve System.

Table I. The 1949 distribution did not differ substantially from the pattern of earlier postwar years. Over the 1946–49 period, however, there was an appreciable increase in the proportion of spending units having no liquid assets. About 14,500,000 spending units, or 29% of the total number in the United States, had no liquid assets in early 1949.

Table II summarizes data provided by the four consumer-finance surveys on the distributions of spending units and total money income according to size of income. These data reveal a significant upward movement in the income distribution since World War II. This was an extension of developments in evidence over the war period. The postwar expansion of total money income was accompanied by a shifting of many consumers to higher income levels. This shifting, it should be emphasized, pervaded the entire income distribution. The surveys found that when the nation's spending units were ranked into tenths by size of income there were only slight changes from 1945 to 1948 in the proportionate share of total money income received by each tenth.

A longer-term comparison of changes in the distribution of income is afforded by Table III. This shows for two prewar years and full-employment year 1948 the percentage of money income going to each fifth of the total number of families and single persons, ranging from those with the lowest incomes to those with the highest.

It is evident that from 1935–36 to 1948 there was a redistribution of income in the United States away from the highest income bracket. The second, third and fourth income brackets significantly improved their relative positions, whereas the percentage of total money income received by the highest bracket declined from 53 to 47.

State Distribution of Income.—Income payments were of record dollar volume in nearly every state in 1948, the latest year for which official (department of commerce) data on the geographic distribution of income were available in 1949. On a nation-wide basis, incomes received by individuals increased 9% from 1947 to 1948, reaching the total of $206,000,000,000. (See Table IV.) The largest regional gain was scored by the central states, where the flow of income expanded 12%. The smallest relative increase, 6%, occurred in New England and the far west. In every state of these two regions the rate of income rise was less than that for the country as a whole.

Comparison of the income data for 1948 with those for 1929 affords a measure of long-term trends in the geographic distribution of income. Such a comparison reveals a pronounced relative shift of total income from the New England and middle eastern regions to the south and west. From 1929 to 1948, as shown in Table IV, the increases in income in the far west, southeast, southwest and northwest were substantially larger than the nation-wide rise of 149%. The combined rate of increase for these four regions of the south and west, 216%, was about twice as large as the 105% increase in individual incomes recorded for the middle east and New England. It should be noted, however, that despite their long-term relative income declines, New England and the middle east still received more than one-third of the nation's income payments in 1948.

Table III.—*Percentage of Money Received by Each Fifth of Families and Single Persons*

Families and single persons ranked from lowest to highest income	1935–36	1941	1948
Lowest fifth	4.0%	3.5%	4.2%
Second fifth	8.7	9.1	10.5
Third fifth	13.6	15.3	16.1
Fourth fifth	20.5	22.5	22.3
Highest fifth	53.2	49.6	46.9
All groups	100.0%	100.0%	100.0%

Source: Council of Economic Advisers, based on survey data from National Resource Planning Board (1935–36), Department of Labor (1941) and Bureau of the Census, Department of Commerce (1948).

For the country as a whole, per capita income payments (total income divided by total population) were $1,410 in 1948, an increase of 7% over the 1947 average of $1,319. On a regional basis, relative increases in per capita income were largest in the central states (11%) and the middle east (8%). In the far west, on the other hand, average incomes were no higher in 1948 than in the preceding year. The population of this region rose 6% from 1947 to 1948, as compared with the 2% increase nationally.

Average-income levels in 1948 were highest in the middle east and far west. Per capita income payments were estimated at

Table V.—*Distribution of Incomes in the United Kingdom, 1947*

Range of incomes (in £)	Number of incomes (In thousands)	Amount of income before tax (in £ million)	Amount of income after income tax and surtax (in £ million)
Under 250	(13,000)	2,480	2,447
250– 500	7,900	2,690	2,470
500– 1,000	1,850	1,224	992
1,000– 2,000	485	654	464
2,000–10,000	165	597	320
10,000 and over	10	184	43
TOTAL	(23,500)	7,829	6,736
Unallocated private income		1,743	1,207
	Total	9,572	7,943

Note.—Unallocated private income includes the undistributed profits of companies, company taxation and any other income which cannot be allocated to individuals. Figures may not add to total shown, because of rounding.

Source: *National Income and Expenditure of the United Kingdom, 1946-48* (H.M.S.O. Cmd. 7649). Figures in parentheses are private estimates.

$1,647 for the middle east, 17% above the national average. The far west's average of $1,579 was 12% higher than that for the country as a whole. Per capita incomes were lowest in the southeast and southwest, where all 15 states, along with West Virginia, were grouped at the bottom of the per capita income array. The composite per capita income of the southern states in 1948 was nearly two-fifths below the average for all states outside the south. (*See* also INCOME AND PRODUCT, U.S.)

(C. F. Sz.)

Great Britain.—The distribution of incomes in the United Kingdom for 1947 was given in the White Paper on national income. The official estimates had to be supplemented by an estimate for the number of incomes in the lowest group which could be made with reference to the estimated total number of income recipients; the distribution still suffered from the defect of not giving sufficient detail for the lowest and largest group. The general tendency, in comparison with 1946, was a shift from lower to higher income groups without changing the number of incomes over £1,000. The distribution of incomes after income tax and surtax, also given, was much more even, to about the same degree as in previous years; it must be remembered that indirect taxes, for which no allowance was made, were of a repressive nature. (*See* Table V.) (*See* also BUDGET, NATIONAL.)

Weizmann, Chaim

(1874–), provisional president of the state of Israel, was born Nov. 27 in Motol near Pinsk in the then Russian part of Poland. After studies at Berlin and Fribourg universities, he became lecturer in chemistry at Geneva university and later, reader in biochemistry at Manchester university, England. In 1916–19 he was director of the British Admiralty laboratories. He was instrumental in securing from the British government the Balfour declaration of Nov. 2, 1917, which promised to favour the establishment in Palestine of a national home for the Jewish people. He was president of the World Zionist organization (1920–31) and of the Jewish Agency for Palestine (1929–31 and 1935–46).

On May 17, 1948, he announced in New York that he had accepted an invitation from the Israeli provisional government to serve as first president of Israel, and on Oct. 1 he took the oath to the state of Israel. Opening on Feb. 14, 1949, in Jerusalem, the first constituent assembly (*knesset hagdola*) of Israel, he emphasized that the new state was being built on solid foundations of freedom, equality, collective responsibility and national self-discipline. On Feb. 16 he was formally elected president of the republic. In the spring he visited the United States, where on April 23 in a speech at New York he pledged his country to accept the fullest international safeguard for the immunity and protection of the holy places in Jerusalem. He also visited Washington and was received by Pres. Harry S. Truman.

West Virginia.

The 35th state in the Union, West Virginia was conditionally admitted on Dec. 31, 1862, and proclaimed a separate state on April 20, 1863, effective 60 days later. It has an area of 24,282 sq.mi., of which 148 sq.mi. are water surface. Pop. (1940 census) 1,901,974, of whom 534,292 were urban. The U.S. bureau of the census estimated the population at 1,941,000 as of July 1, 1949, a 2.1% increase since 1940. Charleston (pop. 67,914) is the capital. Other cities in the order of their size are Huntington (78,836), Wheeling (61,099), Clarksburg (30,579), Parkersburg (30,103), Fairmont (23,105) and Bluefield (20,641).

History.—In 1949, the state legislature, composed of 20 Democrat and 12 Republican senators and 78 Democrat and 16 Republican delegates, completed a 60-day session within the constitutional limit and referred three constitutional amendments: one to relax the provision covering bond issues for school buildings, one for a $90,000,000 bonus for veterans of World War I and World War II, and the third authorizing increases in the pay of the members of the state legislature.

The state officers in 1949, all Democrats, were: governor, Okey L. Patteson; secretary of state, D. Pitt O'Brien; treasurer, R. E. Talbott; auditor, Edgar B. Sims; attorney general, Ira J. Partlow; commissioner of agriculture, J. Blaine McLaughlin; and state superintendent of free schools, W. W. Trent. The attorney general resigned, effective Dec. 1, 1949, and was succeeded by William C. Marland. The state treasurer died Dec. 17 and was succeeded on Dec. 19 by William H. Ansel, Jr.

Education.—In 1948–49 the total net enrolment of the 4,146 elementary schools was 296,644. For the 354 high schools (junior and senior) it was 132,717. There were 10,292 elementary and 5,391 secondary teachers. The total state support for free public schools was $35,543,778, of which $35,362,898 was state aid to schools, $45,000 for homebound, crippled children, $125,000 textbook aid and $10,880 aid to children's homes. The total net revenue collected for 1948–49 was $83,850,874. There were nine institutions of higher learning under control of the state board of education, which had a total enrolment in the first semester of 1948–49 of 8,458, of whom 3,527 were veterans, and a total teaching staff of 482.

Social Insurance and Assistance, Public Welfare and Related Programs.—For the year ending June 30, 1949, the total expenditure for old-age assistance was $6.090,835.24, for the blind $273,659.24, and for dependent children $6,231,812. Including the cost of administration, the total cost of public assistance was $12,596,306.92. With state, county and federal funds totalling $1,420,000, $1,009,492.43, and $243,858.20, respectively, and a balance of $293,232.18 from the preceding year, $2,966,582.81 was spent for general relief, of which $1.263,444.57 was direct relief, $620,091.33 general medical-hospitalization, $13,395.26 correction of vision and prevention of blindness (direct aid), $380,239.15 crippled children (direct aid) and $627,157.18 for administration and services.

Communication and Transportation.—The most important developments were in air transportation. The Kanawha county airport was in process of development at an estimated cost of $7,000,000; commercial airports were in process of construction at Beckley and Huntington; an executive-appointed aeronautics commission was studying aviation with special reference to the needs of the state; and there were approximately 44 daily flights serving the capital city. The year witnessed the exit of the last electric street car, and the mileage of steam railways tended to be stationary at a total of about 7,500, including double tracks and sidings. There were 33,328 mi. of improved state roads, of which 28,411 were secondary. On Nov. 1, 1949, there were 341,739 telephones.

Banking and Finance.—On June 30, 1949, deposits in the 105 state banks and trust companies totalled $438,140,787.25 and those of the 74 national banks, $534,782,000. Resources of 21 federal savings and loan associations were $40,482,333.44; of 16 state building and loan associations, $12,925,349.31; and of 26 industrial loan companies, $17,880,356.05. Total loans of 105 small loan businesses were $17,089,132.21, and 25 state chartered credit unions had total resources of $702,398.18.

State receipts for 1948–49 totalled $233,056,876.73, and the disbursements were $227,388,517.73. As of June 30, 1949, there was a cash balance of $49,503,232.44. The unencumbered balance in the state fund, general revenue, at that time, was $40,183,065.09. The state net indebtedness was $56,372,216.92.

Agriculture.—The total cash income from farm products and livestock in 1948 was $129,592,000, of which $102,019,000 was for livestock and livestock products sold or traded. Government receipts were $1,946,000, and goods consumed on farms had an estimated value of $65,335,000, making a total farm income of $196,873,000, or about $4,000,000 more than for 1947. The average farm income was about $2,000 or about 125% more than the average for the prewar years, 1932–1941.

Principal Agricultural Products of West Virginia

Crop	1949	1948	Average, 1938-47
Corn, bu.	11,748,000	$13,068,000	11,772,000
Wheat, bu.	1,502,000	1,658,000	1,624,000
Oats, bu.	1,606,000	1,740,000	1,772,000
Buckwheat, bu.	95,000	114,000	203,000
Hay (all), tons	1,024,000	1,052,000	937,000
Apples (commercial), bu.	3,720,000	2,750,000	3,946,000
Potatoes (Irish), bu.	2,000,000	2,090,000	3,062,000
Barley, bu.	420,000	330,000	248,000
Tobacco lb.	4,620,000	3,988,000	2,853,000

Industry.—In 1948–49 industry and business employed 517,461 persons, not including 82,500 in agriculture, 36,000 in professional services, 22,000 in domestic service and 7,800 in finance, insurance and real estate. Those employed in industry and business earned $1,489,163,000 or $148,748,000 more than in the previous year. In the order of the largest number of persons employed the largest industrial groups, together with the total wage of each for 1948–49 were: coal mining and coke making 122,048—$505,201,000; commercial, wholesale and retail 93,132—$183,939,000; iron, steel and metals 40,702—$134,081,000; transportation 24,880—$68,706,000; chemicals and allied products 22,098—$81,848,000; glass and glass manufacturing 20,280—$55,081,000; public agencies, buildings and institutions 19,089—$35,711,000; building, erection and repairs 18,138—$52,117,000; automobiles and trucks 17,847—$45,864,000; lumber and wood products 16,340—$29,713,000; personal services, not professional or domestic 15,745—$27,028,000; clay, stone, sand, etc. 14,355—$37,801,000; clothing and textiles 13,846—$32,064,000; construction and building 11,992—$31,426,000; food and beverage products and manufacturing 11,803—$21,055,000; oil and gas 10,482—$25,222,000; and trucking, express and storage 10,442—$28,694,000.

Mineral Production.—The total production of crude oil in 1948 was 2,687,000 bbl.; the natural gas production was 221,130,000,000 cu.ft.; coal production was 168,589,000 short tons; and coke (beehive), 222,614 tons. The volume of gas imported by pipe line from the southwest for redistribution to the east exceeded the volume produced within the state for exportation and consumption.

FILMS OF 1949.—*Coal Country* (Flory Films, Inc.). (C. H. A.)

Whaling: *see* FISHERIES.

Wheat. The U.S. wheat crop of 1949, which amounted to 1,146,463,000 bu., was the sixth consecutive crop of more than 1,000,000,000 bu. Nevertheless, it was a disappointment in that, from a record planted acreage of 84,931,000, about 6,000,000 ac. more than for 1948, the harvest was 13% less than the 1,313,534,000 bu. of 1948. The 76,751,000 ac. harvested gave a yield of only 14.9 bu. per acre, compared with 18 bu. per acre (on 73,017,000 harvested acres) in 1948, and an average yield for 1938–47 of 16.6 bu. Kansas, North Dakota and Texas were the leading producers (*see* Table I).

The 1949 winter wheat crop of 901,668,000 bu. was the third largest on record, exceeded by the 1,007,863,000 bu. of 1948, and the record 1,068,048,000 bu. in 1947. A record of 62,372,000 ac. were seeded in the fall of 1948, of the acreage seeded a record 55,453,000 ac. were harvested. Yields averaged only 16.3 bu., well below the 18.8 bu. of 1948 and an average for 1938–47 of 17 bu.

Spring wheat production, mostly in the northern Great Plains, was estimated at 244,795,000 bu., 20% less than the 305,671,000 bu. of 1948, and 8% below the average of the previous decade. The 21,298,000 harvested acres, the largest since 1932, represented a 9% increase over 1948, and 23% larger than for the decade. Yields were cut sharply by drought and accompanying hazards to an average of 11.5 bu. per acre, compared with 15.7 bu. in 1948, and 15.4 bu. average for 1938–47. Of the total spring wheat, 38,864,000 bu. were of the durum type. Yields averaged 11 bu. per acre, compared with 14 bu. in 1948.

In regard to classes of wheat, the notable gain for 1949 was in soft red wheat, which is mostly produced in the eastern part of the winter wheat belt. A crop of 259,709,000 bu. was produced, as compared with 257,613,000 bu. in 1948 and only 195,588,000 bu. average for the previous decade. But all other types decreased as compared with 1948; hard red winter wheat, for example, to 546,338,000 bu. from 637,765,000 bu. in 1948. As a consequence, elevators from Chicago, Ill., eastward were crowded and prices for the soft red type were depressed.

U.S. exports of wheat and flour (in wheat equivalent) attained an all-time record of 503,216,000 bu. in 1948–49, compared with 480,313,000 bu. in the previous year and less than 100,000,000 bu. prewar. Of that amount about 330,000,000 bu. went to Economic Cooperation administration participants, and another 100,000,000 bu. to the far east, largely Japan and India. Exports in the latter part of 1949 were at a lower rate; July to Oct. 1949 exports were 123,871,000 bu. against 202,104,000 bu. the previous year. Procurement for export, except to occupied countries, was turned back to private channels late in 1949.

The wheat situation at the end of 1949 in summary was: carry-over stocks of 305,773,000 bu. plus the 1949 harvest of 1,146,463,000 bu. provided a total supply of 1,452,236,000 bu. (against 1,484,106,000 bu. total supply the year before). Domestic requirements during 1949–50 were estimated at about 700,000,000 bu. (food 487,000,000; seed 83,000,000; feed 130,000,000). Thus, 752,000,000 bu. appeared to be available for export and carry-over. It was expected that year-end stocks on July 1, 1950, would be at least 350,000,000 bu. and might be nearer 400,000,000 bu. It appeared that practically all the mounting surplus would be held by the Commodity Credit corporation under price support operations.

Wheat prices to producers fluctuated below the loan level in 1949, breaking from $2.02 in January to $1.79 per bushel in August, then recovering. The season average price to producers for the 1949 crop was estimated at $1.86 per bushel (compared with $2.00 for the 1948 crop). The government loan averaged $1.95 per bushel at the farm on the 1949 crop.

The world wheat crop of 1949 was estimated at 6,185,000,000 bu., compared with 6,385,000,000 bu. in 1948 and a prewar average of slightly more than 6,000,000,000 bu. in 1935–39 (*see* Table II). Wheat production in Europe increased very slightly in 1949, compared with the previous year, and remained more than 100,000,000 bu. below the prewar level, a fact accounted for largely by 68,800,000 harvested acres in 1949, against 74,860,000 in 1935–39.

The wheat harvest of the Soviet Union was estimated as the best since the war, although still more than 10% below the prewar average. Production in Asia was lower than in 1948 and about the same as prewar, mostly because of a sharp decrease in China and Turkey. The crop of India and Pakistan was about 40,000,000 bu. larger than in 1948 and nearly up to prewar.

Preliminary forecasts on Argentina and Australia, based largely on acreage and weather, suggested an Argentinian crop

Table I.—*U.S. Wheat Production by Leading States*

(In thousands of bushels)

State	1949	1948	Average, 1938–47
Kansas	164,208	231,368	180,657
North Dakota	111,439	140,958	127,404
Texas	102,848	59,104	53,944
Oklahoma	88,725	98,962	67,428
Montana	64,080	93,718	64,160
Ohio	60,002	57,648	43,274

World Total	6,185	6,385	5,780	6,015

*Revised estimates by the U.S. department of agriculture on basis of incomplete reports from several countries with adjustments for year of harvest, and including allowance for missing data and forecasts for crops being harvested.

about 20,000,000 bu. larger than the previous year and an Australian outturn almost equivalent to the large one of 1948.

World exports of wheat in 1948–49 were about 908,000,000 bu., compared with 893,000,000 bu. in 1947–48. The prewar rate was about 560,000,000 bu. Exports were expected to decline to about 850,000,000 bu. in 1949–50.

The International Wheat agreement, in form slightly modified from that of 1948, was ratified by the U.S. senate as a treaty. Of 37 signatory countries, 32 had ratified late in the year. Import and export operations under the agreement began in August and its effectiveness was yet to be ascertained; by Dec. 15 the U.S. had exported about 28,000,000 bu. of 168,000,000 bu. guaranteed.

At the end of 1949 indications were that the planted acreage for the wheat crop to be harvested in the U.S. in 1950 would be approximately 15% less than in 1949 and near the goal recommended by the government. Winter wheat acreage for the 1950 harvest of 53,023,000, compared with 62,372,000 the previous year and at 16.7 bu. per acre, gave an indicated production of 884,658,000 bu. The general condition of the autumn sown portion of the new crop was good to excellent. (*See* also FLOUR; FOOD SUPPLY OF THE WORLD.) (J. K. R.)

Wilderness Preservation.

The preservation of primeval and primitive areas for recreational, educational and scientific purposes and as monuments of the past became more firmly established as national policy in the United States in 1949 as conservationists realized success in significant steps, notably those directed toward preservation of the Minnesota and Ontario wilderness canoe country which is shared by the United States and Canada.

In 1948 the 80th congress, through public law 733 and a house of representatives committee report on this measure, had reaffirmed the purpose of preserving the primeval character of this region and had authorized an appropriation of $500,000 for purchasing privately held lands within the designated roadless areas of the Superior National forest. The committee report pointed out that within the past two or three years development of the cargo-carrying aeroplane, servicing resorts on privately owned lands within the wilderness reserves and transporting passengers to and from these resorts, had threatened the destruction of the wilderness and the wilderness values of the canoe recreation for which the areas had been established.

Pursuant to this public law 733, the 81st congress in 1949 made an initial appropriation of $75,000 for the fiscal year to end June 30, 1950, for the purchase of the privately owned lands and thus the removal of the resorts which were inconsistent with wilderness preservation.

On Dec. 17 Pres. Harry S. Truman in an executive order (no. 10,092) dealt with the aeroplane menace to this wilderness by establishing an airspace reservation barring all aeroplanes over the roadless areas below an altitude of 4,000 ft. above sea level, except those making emergency landings, navigating when low-level flight is necessary for safety, conducting rescue operations or conducting or assisting in the conduct of official business of the United States, the state of Minnesota or of Cook, St. Louis or Lake counties, Minn. A further exception to avoid hardships postponed the effective date in certain instances, providing that "subject to general regulations of the Secretary of Agriculture, aircraft may be navigated within this airspace reservation until January 1, 1952, for the purpose of direct travel to and from underlying private lands; provided that air travel was a customary means of ingress to and egress from such lands prior to the date of this order."

President Truman had thus for the first time invoked for the protection of wilderness the authority which the Air Commerce act of May 20, 1926, granted the president to establish such reservations for national defense and other governmental purposes. The action had been recommended by Secretary of Agriculture Charles F. Brannan and endorsed by the secretary of the interior, but the secretary of commerce, following recommendations by the Civil Aeronautics administration, had declined Secretary Brannan's request that he forward the recommendation to the president.

Urging establishment of the aeroplane control were the Izaak Walton League of America, The Wilderness society and other civic and conservation organizations, co-operating particularly with the president's Quetico-Superior committee, of 919 North Michigan avenue, Chicago 11, Ill., a special five-man committee first appointed by Pres. Franklin D. Roosevelt and reappointed with enlarged authority by President Truman on Sept. 6, 1947.

Wilderness preservation—thus endorsed by the congress and the president in a test case which had been the subject of controversy—was also the subject of an extensive study by the legislative reference service of the Library of Congress made at the request of the chairman of the subcommittee on fisheries and wildlife conservation of the house of representatives' committee on merchant marine and fisheries. Published in September as Committee Print No. 19, entitled *The Preservation of Wilderness Areas: An Analysis of Opinion on the Problem,* by C. Frank Keyser, regional economist of the legislative reference service, the resulting 114-p. report included a 39-p. annotated list of "Wilderness Areas in the United States" and a 10-p. list of additional suggested areas. Outstanding federal areas were the primeval national parks, certain wildlife refuges, roadless areas of Indian reservations and 77 specially designated wilderness, wild, primitive and roadless areas within the national forests. Commenting on the report, *The Living Wilderness* said editorially: "Never before have so many responsible officials considered so pointedly the needs for wilderness and the problems in its preservation. Never before has so much of the data needed by those concerned with the development of an American policy for wilderness preservation been assembled and made so conveniently available." Included in the study were reports from five federal agencies, 72 replies from 105 questionnaires to various organizations and 112 responses from 209 inquiries addressed to state officials. The report concluded that "a survey of the public lands of the nation, and some private lands as well, should be made with a view to determining two facts: (1) Whether the present dedicated wilderness areas meet all the qualifications and whether they are too large or too small and (2) for the purpose of locating additional areas capable of meeting those qualifications. This," it was suggested, "may be done at the direction of Congress, possibly by a joint resolution or concurrent resolution authorizing the survey." Great significance was attached to this study by conservationists and steps were under way at the close of the year to carry out its recommendations. (*See* also FORESTS; NATIONAL PARKS AND MONUMENTS; UNITED STATES; WILDLIFE CONSERVATION.)

Federal sources of information were the department of agriculture's forest service and the department of the interior's fish and wildlife service, office of Indian affairs and national park service, addresses for all of these being Washington 25, D.C. The Wilderness society, 1840 Mintwood Pl., N.W., Washington 25, D.C., published *The Living Wilderness* quarterly. (H. Z.)

Wildlife Conservation.

The convention of the International Technical Conference on Protection of Nature at Lake Success, N.Y., Aug. 22 to 27, 1949, was an outstanding event of the year in wildlife conservation. Held concurrently with the United Nations Scientific Conference on the Conservation and Utilization of Resources, it recommended establishment of an international survival service for information purposes, proposed the maintenance of an open list of rare and threatened animal species, and called attention to a partial list which included 13 birds and 14 mammals. Sponsored jointly by the United Nations Educational, Scientific, and Cultural organization and the International Union for the Protection of Nature, this conference emphasized the interrelations of human welfare and wildlife conservation and sought to promote United Nations studies of ecological areas to increase knowledge of human ecology.

In March the 14th North American Wildlife conference brought to Washington, D.C., a record attendance of 1,147 from 47 states, Alaska, the District of Columbia, Canada, Mexico and Argentina. The transactions, published by the Wildlife Management institute, sponsor of the conference, comprised some 65 papers, most of which were reports of studies and investigations and constituted an outstanding symposium on the status of wildlife in North America.

In June the fish and wildlife service of the U.S. department of the interior reported a compilation of state estimates of big-game numbers for 1947—latest available at that date—including inventories on national forests, parks and refuges. It showed a total of 7,758,000 in the United States and reported a total of 891,200 taken by hunters.

A special report on *The Moose and Its Ecology* issued in Dec. 1949 by N. W. Hosley of the service estimated that there were approximately 19,000 of these animals in eight or nine northern states—as compared with an estimated 12,000 in 1944 and 17,900 in 1947. Alaskan estimates showed approximately 30,000, while it was speculated from United States and Alaskan densities and from Canadian conditions that moose in Canada might number about 146,000.

Upland game birds were discussed in a session of the North American Wildlife conference. The wild turkey was reported as in generally poor shape west of the Mississippi and only slightly better in a few eastern states. The bobwhite quail was reported steadily decreasing in all the states where it is important as a game species. In a majority of 26 states studied, pheasant populations had partially recovered.

Intensive investigations of waterfowl were continued by the fish and wildlife service. A wintering grounds inventory Jan. 11 to 14 indicated a 12% increase in duck numbers over the preceding year, a 32% increase in geese, a 39% increase in brant and a 20% increase in swans. A 56% decrease in coot numbers, however, resulted in a 1% decrease in total waterfowl. Numerical totals were not reported. Drought conditions later in the year adversely affected important sections of the breeding grounds in the short grass prairie regions of Saskatchewan and Alberta and made the 1949 increase not as large as was expected. Nevertheless, it was such as to lead to a ten-day lengthening of waterfowl shooting seasons.

Hunting licences sold in the United States increased to a new high in the year ended June 30, 1949, totalling 12,758,698, as compared with 11,391,810 in 1947–48. Total fees paid increased from $29,814,327 in 1948 to $34,966,687 in 1949. Michigan led in the number of licences sold in the 1949 year, with 977,879. Pennsylvania was next with 878,669, followed by New York with 847,314 and Ohio with 718,292.

Sales of federal migratory bird hunting stamps also increased to a new high record of 2,127,598 for the year ended June 30, 1949. The 81st congress increased the price to $2 and also provided that not to exceed 25% of any refuge area acquired with

HERD OF ELK seen from a U.S. air force C-47 plane which had just dropped bales of hay for them in the deep snow near Denver, Colo., in Feb. 1949. The feeding project was carried out by the Colorado game and fish department to keep the elk from foraging on ranchers' haystacks funds under the new law might be administered for public hunting in the discretion of the fish and wildlife service.

Under the federal aid program for wildlife restoration projects in the states, an appropriation of $11,276,687 from excise taxes on arms and ammunition was made available during the 1949 fiscal year—largest ever made—and a record number of projects (612) were approved for the 48 states, Alaska, Hawaii, Puerto Rico and the Virgin Islands.

Significant progress was made by the fish and wildlife service's office of river basin studies in surveying the biological aspects of proposed flood control, irrigation, hydroelectric and other development projects, 231 such projects having been reported on during the year. (*See* also NATIONAL PARKS AND MONUMENTS.)

(H. Z.)

Canada.—The dominion wildlife service reported that 30% of the wild ducks examined by fluoroscope carried shotgun pellets. Fearing that use of aircraft would reduce sportsmen to hunting rabbits and squirrels, it recommended that pilots be made honorary enforcement officers, that large game areas be closed to air-transported sportsmen, that provincial game wardens be supplied with aircraft for patrol purposes. Parliament increased the service's funds for 1949–50 to $259,520.

Ducks Unlimited allocated $325,000 for improvement of duck breeding grounds in western Canada. Antipollution activity was aided by the Canadian discovery that magnesium-based sulphite was better than calcium-based sulphite because the former could be almost completely recovered after the digestion of pulp and used again whereas the latter had to be dumped into streams as waste.

The Northwest Territories council decreed that all trap lines should be registered as a conservation measure. The beluga, a milky-coloured sea mammal of Hudson bay, was brought under protection by the federal government, and only Indians, Eskimo and royal Canadian mounted police could kill them without licence. The federally-controlled arctic reindeer became so numerous that ear-tagging was planned to maintain control.

BIBLIOGRAPHY.—Dept. of Mines and Resources, *The Protection of Migratory Birds*, a consolidation of legislation and regulations (1949).

(C. Cy.)

Other Countries.—In British Africa informal conferences between game departments were held and scientific research into such problems as game-borne diseases continued. Where the policy of national parks had been accepted delay in giving it effect was still caused by difficulties over boundaries and native reserves. In India the existing legislation for the protection of nature was undergoing revision. In Great Britain the Nature conservancy was founded by royal charter to advise the government on establishing nature reserves and to carry out necessary researches in connection with them. The National Parks and Access to the Countryside bill proposed to confer upon the Nature conservancy considerable powers to acquire land for the creation of nature reserves.

Windward Islands.

The British Windward Islands (in the Caribbean sea) comprise the four islands of Dominica, St. Lucia, St. Vincent and Grenada—each ranking as a separate colony for internal administration—together with the Grenadines, which lie between St. Vincent and Grenada and are associated partly with the one and partly with the other.

Windward Islands

	Dominica	Grenada	St. Lucia	St. Vincent
Revenue	B.W.I. $1,222,499*	B.W.I. $2,255,334*	B.W.I. $1,933,891*	B.W.I. $1,788,655*
Expenditure	B.W.I. $1,318,319*	B.W.I. $3,498,828*	B.W.I. $1,951,148*	B.W.I. $1,753,127*
Imports	£475,559†	£1,293,433†	B.W.I. $4,117,853‡	£692,967†
Exports	£200 423†	£995,730†	B.W.I. $1,116,832‡	£234,647†

*1949 est. †1947. ‡1948 provisional.

Total area: 821 sq.mi. Total pop. (1948 est.): 256,000. Governor: R. D. H. Arundell.

History.—It was announced in April 1949 that the secretary of state for the colonies had agreed to certain constitutional changes including the introduction of adult suffrage (subject to a single literacy test only) at the next elections for the legislative councils and the removal of the property qualification for a candidate, subject to further examination of the existing arrangements for deposits which candidates were required to make.

The rebuilding of Castries, capital of St. Lucia, which was wiped out by fire in June 1948, was entrusted to the Colonial Development corporation and work began in April. A town plan was published. Public funds were made available to the government of St. Lucia to the amount of £700,000 in addition to bank loans for the financing of private building.

In Dominica it was announced that the secretary of state had approved additional assistance for development of B.W.I. $2,160,000 (of which B.W.I. $1,248,000 was expected to be a free grant and B.W.I $912,000 a loan) over and above the original Colonial Development and Welfare grant of B.W.I. $1,627,000, and that the Colonial Development corporation had completed plans for the establishment of a group project involving investment of more than B.W.I. $960,000.

Finance and Trade.—Currency (from 1948): British West Indian dollar: value (Dec. 1949) = 58.33 cents U.S.

Principal exports: lime juice, cocoa, sugar, cotton, copra and arrowroot.

(Jo. A. Hn.)

Wines.

France once again was the largest producer of wine in 1949. Total production of famous growth (Appelation Controlée) wines amounted to 118,500,000 gal. against a total of 130,000,000 gal. in 1948. The famous growths of Burgundy and Rhône produced 16,900,000 gal. against 19,600,000 the previous year, the quality being almost equal to the great 1947 wines, and Bordeaux 59,000,000 gal. of excellent quality

World Production of Wine

(Millions of gallons)

Country	1949	1948	Average	1949 Quality

Yugoslavia	127.5	108.8	150	
	4,587.6	4,552.5		

*Unknown.

Countries like the United States, marked "No variation" in the above table, produce uniform wines from year to year because of stable climatic conditions and methods of production used.

against the 1948 yield of 63,200,000. Champagne production was rather small but of high quality.

During 1949 prices dropped somewhat, because of importation into France of current wines from other countries. Algerian production was the highest in ten years.

In Spain, the Jerez district produced 6,600,000 gal. of sherry against 9,200,000 the previous year. This district had the least rain of the preceding 15 yr. Of the Portuguese wines, port wine, controlled to world demand, was held to 4,400,000 gal.

United States production was the smallest since 1945. About 90% of the production was from the state of California; 85% of the total were dessert and appetizer wines and the remaining 15% table and sparkling wines. About 8% of the total were first class premium wines. Actual consumption rose about 18%.

During 1949, the California wine industry established the Grape Stabilization Advisory board to control the overproduction of California wine. (J. We.)

Wisconsin.

One of the north-central states of the United States, Wisconsin, popularly called the "Badger state," entered the union as the 30th state in 1848. Area, 56,154 sq.mi. of which 1,439 sq.mi. are water. The population was estimated as of July 1, 1949, at 3,355,000, an increase of 217,000 over the federal census figures of 1940. The urban population in 1940 was 1,679,144 and the rural 1,458,443. Only 24,835 were nonwhite. Foreign-born whites numbered 288,774. Capital, Madison (pop. est. 1949, 85,000). Milwaukee is the largest city with an estimated population of 633,000. Other large cities are Racine (75,000), Kenosha (55,500), Green Bay (50,000) and La Crosse (50,000).

History.—The major accomplishments of the 1949 session of the legislature lay in the fields of education and public welfare. By recapturing $11,000,000 in unobligated building appropriations and adding another $14,000,000, it established a $25,000,000 fund for welfare and educational buildings. More than half this total was for mental institutions. Beds were provided for an additional 1,400 mental patients, an extra $1,000,000 was allocated for the hiring of additional doctors and staff, and the state welfare board and department were reorganized. A proposed consolidation under a single board of the higher educational facilities of the state was defeated, but school aids were raised to $33,500,000, the school transportation aid was increased by $2,500,000, the compulsory school attendance age was raised from 14 to 16, and a proposed constitutional amendment increasing the municipal debt limit for school purposes was passed.

To finance the building program and educational aids, a 25% surtax was added to the state income tax, and the state tax on cigarettes was increased one cent a pack.

The legislature also established a long-range building program under a state building commission with its own appropriation for preliminary plans and surveys and the allocation of priorities; appropriated $16,000,000 for veterans' housing; defeated a veterans' bonus bill; re-established a state maximum speed law of 65 m.p.h. by day, 55 by night; defeated a large number of anti-Communist restrictions; rejected a pension system for judges; barred segregation in the national guard; purchased a new executive mansion.

State officers: Oscar Rennebohm (Rep.), governor; George Smith (Rep.), lieutenant governor; Fred R. Zimmerman (Rep.), secretary of state; Warren R. Smith (Rep.), state treasurer; Thomas E. Fairchild (Dem.), attorney general; George Watson, superintendent of public instruction (succeeding John Callahan, July 5, 1949).

Marvin B. Rosenberry retired as chief justice of the state supreme court at the close of the year, and was succeeded by the senior justice in terms of service, Oscar M. Fritz.

Education.—There were approximately 6,000 elementary and 455 secondary schools, 25 county normal schools and 9 teachers colleges in 1948–49. Enrolment in the elementary schools totalled 348,903; in secondary schools it was 141,892; and in county normal schools 826. Elementary schools employed 13,944 teachers, while secondary schools had 6,568 and the county normal schools had 103. The teachers colleges had 555 faculty members teaching 8,868 college and 2,254 training school students. State aid for education in the fiscal year 1947–48 amounted to $14,554,807. Total expenditures in all elementary and secondary public schools were $91,193,022.

Social Insurance and Assistance, Public Welfare and Related Programs.—The number of cases receiving public assistance as of June 30, 1949, was as follows: general relief 7,344; old age assistance 49,316; aid to the blind 1,334; aid to the totally and permanently disabled 620; dependent children in their own or a relative's home 8,308; dependent children in foster homes 1,286—a total of 59,899 households. Expenditures for public assistance in the year ending June 30, 1949, were: general relief $3,886,033; old age assistance $19,974,061; aid to the blind $731,084; aid to the totally and permanently disabled $407,263; dependent children in their own or a relative's home $9,346,267; dependent children in foster homes $550,888—making a grand total of $34,895,696. Civilian unemployment benefit payments during the calendar year 1948 were $4,895,635 as against $3,389,620 in 1947 and $7,771,329 in 1946. The contributions for 1948 totalled $10,788,433 as compared with $16,292,966 in 1947 and $7,590,280 for 1946.

Wisconsin's 13 charitable, mental and correctional institutions during the year ending June 30, 1948, were operated at a cost of $8,227,092. The average daily population for June 1949 was 9,406.

Communications.—Public highways as of Jan. 1, 1949, totalled 94,028 mi. divided as follows: 85,357 (towns), 2,465 (villages), and 6,206 (cities). Expenditures by the Highway commission for the fiscal year of 1948–49 were $71,869,545. The total railway mileage (steam and electric) as of Dec. 31, 1948, was 6,658.06 with 52.69 mi. of trolley coach route (trackless). There were 896,262 telephones, and on Dec. 15, 1949, there were 168 airports and 10 seaplane bases.

Banking and Finance.—At the end of 1948 there were 95 national banks and 460 state banks (a decrease of 1). National banks had deposits of $1,396,538,000 and assets of $1,488,791,000. Deposits in state banks totalled $1,561,620,145, and the assets were $1,662,931,367. The 542 credit unions (11 more than in 1947) listed assets of $30,347,672. Assets of the 113 savings and loan associations totalled $201,339,274, an increase of more than $20,000,000.

State receipts for the fiscal year ending June 30, 1949, were $187,889,843; disbursements $177,004,191. Taxes collected by the state and returned to local subdivisions totalled $53,821,045; agency collections returned to counties were $1,339,331; state aids amounted to $51,547,232.

Agriculture.—Total acreage harvested in 1948 was 10,270,000. Cash receipts were $1,150,524 consisting of $148,057 from crops and $1,002,467 from livestock and its products, including milk. Wisconsin had a good crop year; corn set a new production record, and hay production was larger than in 1947. Feed grain crops were slightly smaller. Fruit crops varied. All important canning crops showed above average production. For the first time in a decade, farm wages declined slightly because of a larger labour supply, increased use of farm machinery and a lower level of farm income.

Table I.—*Leading Agricultural Products of Wisconsin*

	1949	1948	Average, 1938-47
Corn (bu.)	129,800,000	113,252,000	101,106,000
Oats (bu.)	119,884,000	126,148,000	103,365,000
Canning peas (lb.)	234,260,000	168,260,000	—
All tame hay (tons)	6,288,000	5,458,000	6,946,000
All clover and timothy (tons)	2,280,000	3,041,000	4,061,000
Alfalfa (tame)	3,554,000	2,039,000	2,286,000

Manufacturing.—The total value of Wisconsin manufactured products in 1947 was $2,260,574, an increase of approximately 230% over the 1939 value. Most important industries in value of manufactured products were machinery (except electrical), fabricated metal products, motor vehicles, malt and malt liquors and primary metal industries. In 1948 the estimated average number of wage earners in Wisconsin manufacturing establishments was 337,100, compared with 339,700 in 1947 and 308,400 in 1946, while the average aggregate weekly pay roll had increased from $17,800,000 in 1947 to $19,200,000 in 1948.

Table II.—*Value of Mineral Products of Wisconsin*

Mineral	1947	1946
Stone	$11,669,611	$11,473,119
Iron ore	5,108,260*	3,369,236*
Zinc	2,958,208	3,483,344
Sand and gravel	9,938,778	6,902,929

*Estimated.

Mineral Production.—In 1947 the value of all mineral production in Wisconsin was $34,942,000 compared with $28,596,000 in 1946 and $22,217,000 in 1945. (C. L. L.)

Wool. World production of both apparel wools and carpet wools in 1949 was estimated to have increased 1.5% over 1948 to a total of 3,768,000,000 greasy pounds. The production for 1948 and 1949 of the principal wool-producing countries of the world is shown in the table.

World Wool Production
(greasy shorn pounds)

Country	1949	1948
Australia	1,080,000,000	1,015,000,000
New Zealand	365,000,000	357,000,000
Argentina	460,000,000	495,000,000
Uruguay	160,000,000	160,000,000
South Africa	218,000,000	189,000,000
United States	274,000,000	320,000,000
Total	2,557,000,000	2,536,000,000
Others (including carpet wools)	1,211,000,000	1,176,000,000
Grand total	3,768,000,000	3,712,000,000
Apparel type	2,998,000,000	2,943,000,000
Carpet type	770,000,000	769,000,000

Source: International Wool Secretariat, amended by N.Y. Wool Exchange.

There continued to be a greater demand for fine wools throughout the year than was available to the world wool trade. This was borne out by the keen bidding for wools in all major markets. Australia exported approximately 1,284,000,000 greasy shorn pounds, or 204,000,000 lb. more than were shorn. Only in Argentina of the major wool-producing countries were exports and local consumption considerably less than production.

One new factor which tended to change the movement of wools in international trade was the aggressiveness of many wool-producing nations, including Australia, the Union of South Africa, Argentina and Uruguay, in developing their own wool manufactures. These four countries were progressively using more wools themselves than formerly, and exporting them as semimanufactured or finished goods. A few of the large producing nations reported that the downward trend in the growing of merino or fine wools appeared to have ended, and that breeding indicated a gradual increase in their production.

In addition to disposing of most of the 1949 clips, the United Kingdom-Dominion Wool Disposals Limited reported on June 30, 1949, that its stocks of wools were about 460,000,000 lb. less than on June 30, 1948, and that the weight of wools remaining under its control totalled about 540,000,000 lb., a large part of which represented defective wools. The stock pile of wools under the control of this joint organization was probably reduced another 200,000,000 lb. by the end of the year, leaving only 300,000,000 lb. still to be sold out of an original total of more than 3,000,000,000 lb.

The Commodity Credit corporation, a U.S. government agency, reported on Sept. 30, 1949, that its stock pile of wools totalled 88,000,000 lb., compared with 120,000,000 lb. on Sept. 30, 1948. At the end of the third quarter of 1949, 48% of the wools owned by the Commodity Credit corporation were the 1949 clip, 25% were 1948 wools, 11% were 1947 wools and 16% were 1946 and older wools.

United States imports of apparel wools were sharply curtailed during 1949. In the first eight months only 76,000,000 clean pounds were entered for consumption, compared with 284,000,000 lb. in the first eight months of 1948, and 250,000,000 lb. in the same period of 1947. This drastic decline in U.S. wool imports caused a sharp contraction in wool stocks, it being estimated that on Dec. 1 apparel wools in the United States represented about 168,000,000 clean pounds, compared with 274,000,000 lb. on Dec. 1, 1948, and a high of 488,000,000 lb. on Dec. 1, 1946. Conversely, wool stocks in Argentina tended to accumulate, because of the relatively small amounts which were exported.

Consumption of apparel-type wools was sharply curtailed in the United States, but elsewhere there appeared to have been broadening wool-textile activity.

For the greater part of the year, prices in the United States were above the government support level, which factor accounted for less government buying than in the preceding year. Prices of domestic wools in the United States, after some firmness during the first quarter, entered a slow decline from an average of around $1.52 per clean pound in the Boston wool market to $1.38 in October. A better demand in the final quarter lifted prices slightly.

Using Australian wools as a pattern for foreign wool prices in the United States, fine Australian wools, duty paid in Boston, American yield, began the year at $2.18. Less demand, rather than replacement values, caused Australian wools to decline in price in the Boston market, with a substantial drop to $1.45 in late September, following currency devaluations. Thereafter, a firming tendency in Boston coincided with rising prices at the wool sales in Australia. The year closed with fine Australian wools quoted in Boston around $1.60.

In the foreign wool markets, prices also became somewhat lower in late spring and summer. In the pence markets, Australian fine wools were quoted around 97*d.* the first of the year in London. By June these same wools had declined to about 88*d.* A further sharp drop, recorded when sterling was devalued, was followed by rapidly improving prices, so that at the end of the year the so-called pence markets were above January quotations. Many expected benefits from devaluation were thereby erased before the end of the year.

In October, the United States congress approved a new farm support bill, the terms of which became effective on Jan. 1, 1950. This bill, as it specifically refers to wool, follows:

> The price of wool (both shorn and pulled, including mohair) shall be supported through loans, purchases, or other operations at such level, not in excess of 90 per centum nor less than 60 per centum of parity price therefor, as the Secretary determines necessary in order to encourage an annual production of approximately three hundred and sixty million pounds of shorn wool. (Parity price for wool and mohair will be computed according to a 'modernized' system, figured on the farmers' 'fair return' in the past ten years and including farm labor costs.)

The formula for the new parity price under which this bill would operate was expected to be about three cents above the old parity, and therefore the income of wool growers would also be greater than formerly. The Commodity Credit corporation, however, would be able to sell the wools acquired at the current market level, even though it were lower than the price paid for the wools. (*See* also Textile Industry.)

(S. L. L.)

Words and Meanings, New. English adds many new words to its vocabulary every year, some destined to live long, others to die soon. The words listed below, pertaining largely to 1948–49, are but a small residue of those collected by the committee preparing this article.

Several groups of the coinages below may be commented upon briefly. As usual, scientific and technological advances were well represented among the new words: witness "afterburner," "Airdent unit," "automation," "avionics," "Benthoscope," "BINAC," "hydrogen bomb," "hypersonic," "nuclear reactor" and "rotochute." Medical science was represented by such coinages as "Antabuse," "banthine," "botogenin," "neomycin," "space medicine," and "tibione (TB-1)." New terms like "bizone," "dollar gap," "neo-Nazism," "Titoism," "Unescan" and "wetback" reflected the international scene. The U.S. scene was represented by a number of interesting coinages reflecting a wide variety of fields and activities from national politics to fashions: for example, "canasta," "five percenter," "me-tooism," "no-day (work) week," "Operation 'Haylift,'" "Pyramid club," "sanity code" and "scatter pins." Of especial interest to Americans in 1949 seemed to be the ideas and things described by the terms "ACTH," "antihistaminic," "cortisone," "Fair Deal," "statism" and "welfare state."

New terms for television were still vying for recognition. At the end of 1949, "TV" seemed to be established as the informal term, "television" the formal.

The words listed below became prominent or were seemingly used for the first time during 1948 and 1949. Dates within the parentheses following a word or definition indicate the first recorded use of the new word or meaning in the files of the committee.

A preceding hyphen means that the word or meaning is suspected to be older than the date given. If no date is given, the first record on file is 1949.

ACTH. Adrenocorticotropic hormone, a hormone secreted by the pituitary gland, being studied as a possible cure for arthritis.

afterburner, *n.* A ram-jet booster engine. (1948)

Airdent Unit. An instrument developed by Robert B. Black for drilling teeth with an abrasive directed by a fine stream of compressed air. Trade-mark.

Antabuse (*anti*+*abuse*), *n.* Tetraethylthiuramdisulphide, a drug developed in Denmark, which was reported to counteract alcoholism. Proprietary name. (1948)

antihistaminic, *adj.* Pertaining to that which opposes histamine, a body substance which weakens the defenses of the body, as against the cold virus. Also *n.* (**antihistamine,** *n.* is older)

Antrycide, *n.* Synthetic drug developed in England to combat the tsetse fly. Trade-mark. (1948)

APF. Abbreviation of "**animal protein factor,**" a vitamin complex in which vitamin B_{12} is a dominant factor.

apparatus, *n.* An organized group operating secretly. (1948)

automation (*automatic*+*-tion*), *n.* (1) The study which attempts to increase the automaticity and efficiency of manufacturing processes; (2) The automaticity of a process. (Coined by D. S. Harder, a vice-president of the Ford Motor company.)

avionics (?*avi*ation+electr*onics*), *n.* *Aeronautics.* Term proposed by the magazine *Aviation Week* to cover "the applications of electricity to the field of aeronautics."

banthine, *n.* A synthetic drug to relieve peptic ulcer. It is taken by mouth.

beefcake (Imitation of *cheesecake*), *n.* *Humorous.* The exposure of men's chests.

Benthoscope (Gr. *benthos*, "sea-depth,"+*skopein*, "to look at"), *n.* A strong steel sphere, large enough for a man, for deep-sea diving and observation. (1945)

bikini, *n.* An abbreviated bathing suit for women. (–1948)

BINAC, *n.* Trade-mark used to describe an automatic, electronic computing machine employing the binary system of numbers.

bizone (backformation from *Bizonia*, *bizonal*), *n.* The Anglo-American zone in western Germany. (1948)

bloodmobile, *n.* An automobile used to collect voluntary contributions of blood. (1948)

BNB, BNP. Insecticides, both of which were reported to be safer to use and more powerful than DDT.

Bold New Program. Applied both to President Harry S. Truman's **Fair Deal** and to **Point Four** (*qq.v.* below.)

bonus player. *Baseball.* A free agent signing a player's contract with a major or minor league club for a sum in excess of the amount allowed for that class of league in the major league agreement. (1947)

botogenin, *n.* A substance found in the Mexican yam (*Dioscorea mexicana*), investigated as a good source of **cortisone** (*q.v.* below).

bracero (Sp.), *n.* A Mexican contract labourer. (–1945)

breeder reactor. *See* **reactor,** below.

brushed leather. Suede leather, technically known as reversed calf.

Cana Movement. The doctrine that God must enter into every marriage. (1948)

canasta (Sp.), *n.* An Argentine game with some features of rummy.

Capacitron, *n.* A cyclotron developed by Arno Brasch and others, with such commercial applications as the sterilizing and preservation of food. (1947)

cellano, *n.* A fourth type of human blood, so called from the family name of the mother through whom it was found.

chucks, *n.* *Teen-age slang.* Something humorous.

cold rubber. A synthetic rubber made at a low temperature (41°F.) and characterized by strength and toughness. (–1948)

community college. A junior college designed to serve the needs of its community.

Compound E. *See* **cortisone,** below.

cortisone, *n.* Short for the chemical 17-hydroxy-11 dehydrocorticosterone, a hormone from the adrenal cortex used experimentally to control and eliminate arthritis. The name was coined by Edward C. Kendall and Philip S. Hench and announced by Kendall, the discoverer of the chemical. Formerly called **Compound E.**

Council of Europe. A group composed of representatives of the democracies of Europe.

delta-wing plane. An aeroplane (Model 7002) made by the Consolidated Vultee Aircraft Corp. for the United States air force; shaped like the Greek letter delta and designed for near-sonic speeds at extremely high altitudes. (–1948)

depth interview. A lengthy, "qualitative" interview in which the interviewer considers the subject from all points of view and endeavours to explore the subconscious of the interviewee. (1948)

disposable income. Amount remaining after various government taxes have been deducted. (1948)

Dixiegop (*Dixie*crat+*GOP*, "Grand Old Party"), *n.* Coalition of Dixiecrats and certain Republicans in opposition to some of President Truman's measures, especially civil rights.

dollar gap. The shortage in dollar-exchange existing when a country's essential imports from a dollar area, such as the United States, exceed its exports to that area.

Dramamine (Arbitrary coinage), *n.* The registered trade-mark of G. D. Searle & Co. for dimenhydrinate, a potent, nontoxic, prophylactic and therapeutic drug (a synthetic organic chemical B-dimethylamino-ethyl benzohydryl ether 8-chlorotheophyllinate) for prevention and relief of motion sickness.

Earth Satellite Vehicle Program. Project of the United States for the study of guided missiles. (1948)

economy house. *Calif.* A very small house.

electronic brain. Term applied especially to such electronic calculators as **BINAC** (*q.v.*, above). (1947)

Fair Deal. (1) The policy of social improvement of President Truman, outlined in his message to congress, Jan. 1949; (2) Any similar policy. **Fair Dealer.**

feedlift, *n.* *See* **haylift,** below.

Firebird, *n.* Popular name of the XAAM-A-1 ("experimental air-to-air missile, air force, first model"), a ten-foot rocket-driven bomb finding its target and exploding near enough to damage it.

five percenter. A contract broker charging 5% for his services; specifically, a person promising to obtain a government contract for a business man for a fee of 5%. Also called **peddler of influence.**

freeze-drying, *n.* Quick-freezing followed by heat-drying in a vacuum cabinet.

Geigers (after *Geiger* counter), *n. pl.* *Popular.* Generic term for atomic rays and particles. (1948)

guppy, *n.* *Popular.* A snorkel submarine. (1948)

haylift, *n.* An air lift (**Operation "Haylift," "Hayride," "Snowbound"**) for the transportation and dropping of feed for starving cattle in the west and the midwest, snowbound by a heavy storm in Jan. 1949. Also **haydrop,** *n.*

Howdy Doody. A popular doll puppet, first used on a television show. (1948)

hunter-killer, *adj.* *Mil.* Pertaining to that which stalks and attacks with destructive intent. (1945)

hydrogen bomb. The theoretically possible atomic superbomb estimated to be a thousand times more powerful than bombs using plutonium, with heavy hydrogen as the most important ingredient. (1948)

hypersonic, *adj.* Faster than 2,700 m.p.h. (–1946)

Inductive Telephone. A radio telephone for trains. (–1946)

Jetliner, *n.* A jet-propelled airliner. Trade-mark.

jury, *v.* To act as a member of a group which selects entries for an art exhibit. (–1947)

kigmy, *n.* A small animal which enjoys being kicked, created by Al Capp, cartoonist.

killer ship. A **hunter-killer** (*see* above) ship; a surface craft to spot and sink enemy submarines. (*Cf.* **hunting flotilla** of World War I)

Machometer (after Ernst *Mach*), *n.* An instrument which expresses speeds, especially those in the supersonic range, in terms of their relation to the speed of sound. (1946)

me-tooism, *n.* Term used to describe the acquiescence of some Republicans in policies of the Democratic party.

NATIV. Abbreviation of North American Test Instrument Vehicle, a guided missile 13 ft. long and 18 in. in diameter developed by the United States air force for studies in aerodynamics in the high-speed range.

neomycin, *n.* An antibiotic isolated by S. A. Waksman from actinomycetes, of promise in the treatment of tuberculosis.

neo-Nazism, *n.* A rightest movement designed to revive former nazi principles and beliefs. (1947; **neo-Nazi,** 1938)

no-day (work) week. Cessation of work; euphemism for a strike.

nuclear reactor. *See* **reactor.**

Operation "Haylift," "Hayride," "Snowbound." *See* **haylift,** above.

paramilitary, *adj.* Equal to, as important as, military.

paranurse, *n.* A nurse trained to parachute to the spot where first aid is needed. (1948)

parlay, *v. i.* To exploit (something) with marked success: "to parlay a grin into fame." (1942; extension of betting term)

peddler of influence. *See* **five percenter**, above.

phytotron (Gr. *phyto-*, "plant,"+*-tron*), *n.* A laboratory designed by the California Institute of Technology to bring about varying weather conditions so that their effect on plant life may be studied.

pitch-out, *n. Football.* A short lateral pass behind the line of scrimmage, usually from the quarterback to another back. (–1947)

Point Four. The fourth point in President Truman's **Fair Deal** program, namely, aid, technical and otherwise, to economically underdeveloped countries.

prestressed, *adj.* Pertaining to concrete reinforced with high-tension steel wires pulled taut.

purity code. *See* **sanity code**, below.

Pyramid (Friendship) Club. A get-rich-quick scheme, similar to the chain letter, except that money was exchanged personally rather than by mail. **pyramider,** *n.* One who joined a **Pyramid Club.**

radiac set. A compact instrument for "radioactivity detection, identification and computation."

RATO. Rocket assist for take-off. (1945)

reactor, *n.* An atomic pile, in which the production of atomic energy can be controlled. (–1947) Often called a **nuclear reactor.** (1946) The **breeder reactor** produces more atomic energy than is required to operate it. (1948)

rotochute, *n.* A supersonic parachute for the lowering of delicate research instruments from rockets which have been shot to high altitudes.

sanity code. A code adopted by the National Collegiate Athletic association in Jan. 1948, designed to curb and control the recruiting and subsidizing of college athletes. Also called **purity code.**

scatter pins. Small pins "scattered" over a woman's dress; generally used in groups of two or more. (–1948)

simulcast (*simul*taneous+broad*cast*), *v.* To transmit *radio* and *television* at the same time. (1948)

space medicine. Proposed branch of medicine to investigate the conditions of outer space and try to determine their effect on the human body.

statism, *n.* Direction and control by a centralized government of important aspects of the economic life of the citizen. (–1948)

TB-1. *See* **tibione.**

teenicide, *n.* The seeming, wholesale self-destruction of teen-age automobile drivers. **teenicider,** *n. Nonce words.*

tibione, *n.* A drug (chemically 4-acetyl-amino-benzaldenyde-thiosemicarbasone) derived from coal tar and used with streptomycin in the treatment of tuberculosis. Also **TB-1.**

Titoism, *n.* (1) The principles and policies of Marshal Tito of Yugoslavia, especially his advocacy of a communism placing national interests above international, or specifically Russian; (2) Any similar policy. **Titoist,** *n.*

toe, *n. Football.* A player used only for kicking: kickoffs, placements, and, especially, points after touchdown. (–1947)

Unescan, *n.* One who participates in the activities of U.N.E.S.C.O.

Uni-. Short for "united military command" (of the Council of Europe [the western European union]), as provided by the Brussels pact; employed as a combining form. *See* also **Uniair, Uniforce, Unilion, Unimer, Uniter,** below.

Uniair. The air command of the western Union.

U.N.I.C.E.F. United Nations International Children's Emergency Fund. (1948)

Uniforce. The combined command (air, sea and land) of the western union.

Unilion. Chairman of the commanders in chief of the western union.

Unimer. Sea command of the western union.

United States of Indonesia (U.S.I.) Projected for several years, this federation of 16 states was formally set up in Dec. 1949, with the Netherlands as copartner. (–1947)

Uniter. Land command of the western union.

Veep (from *VP*, vice-president), *n.* (1) The vice-president of the United States; (2) (l.c.) Any vice-president.

Veepa, Veepess, *n. Humorous.* Wife of the vice-president of the United States. *Nonce words.*

welfare state. A state whose government assumes the responsibility for providing such social services as unemployment insurance, medical treatment, free milk for school children and old age pensions. (1945) **welfarism,** *n.*

wetback, *n.* A Mexican labourer who, in order to obtain work in the United States, illegally enters the country by swimming or wading the Rio Grande. (1944) (I. W. R.)

World Bank: *see* INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT.

World Commerce: *see* INTERNATIONAL TRADE.

World Council of Christian Education: *see* RELIGIOUS EDUCATION.

World Council of Churches: *see* RELIGION.

World Government: *see* INTERNATIONAL LAW.

World Health Organization: *see* CHILD WELFARE; UNITED NATIONS.

Wrestling.

Iowa State Teachers college won the U.S. Amateur Athletic union team crown in the national championships at Cedar Rapids, Ia., scoring 37 points to defeat Cornell college of Mt. Vernon, Ia., by 5 markers.

A strong band of Oklahoma A. and M. grapplers captured the National Collegiate Athletic association title for the 16th time in 19 years, with 32 points in the annual tourney at Ft. Collins, Colo. Iowa State Teachers finished second in this meet with 27 tallies.

A list of individual champions follows:

National A. A. U.

115-lb.—Arnold Plaza, Purdue; 121-lb.—John Harrison, Iowa Teachers; 128-lb.—Russell Bush, Iowa Teachers; 135-lb.—Lowell Lange, Cornell college; 145-lb.—Keith Young, Iowa Teachers; 155-lb.—William Nelson, Iowa Teachers; 165-lb.—William Smith, Iowa Teachers; 175-lb.—Shufard Swift, Navy; 191-lb.—Vern Gagne, Minnesota; unlimited—Robert Maldegan, Michigan State.

National Collegiate A. A.

121-lb.—Arnold Plaza, Purdue; 128-lb.—Charles Hetrick, Oklahoma Aggies; 136-lb.—Lowell Lange, Cornell college; 145-lb.—Keith Young, Iowa Teachers; 155-lb.—William Nelson, Iowa Teachers; 165-lb.—William Smith, Iowa Teachers; 175-lb.—James Gregson Oklahoma Aggies; heavyweight—Vern Gagne, Minnesota. (T.V.H.)

Wyoming.

A Rocky mountain state of the United States, Wyoming was admitted to the union on July 10, 1890, as the 44th state. Having been a leader in extending rights to women, it is known as the "Equality state." The land area is 97,914 sq.mi.; water area, 408 sq.mi. The 1940 census, totalling 250,742, listed rural inhabitants at 157,165 and urban at 93,577; 229,818 native white; 950 Negro; and 17,107 foreign-born. The July 1, 1949, estimate of the census bureau placed the population at 284,000.

The capital of Wyoming is Cheyenne, with an estimated population (1949) of 35,000. Other cities having an estimated population (1949) of 10,000 or more are: Casper (33,615); Laramie (14,000); Sheridan (14,612); and Rock Springs (12,000).

History.—State officials during 1949 were: governor, A. G. Crane, filling out the unexpired term of Lester C. Hunt, who was elected to the U.S. senate in Nov. 1948; auditor, Everett T. Copenhaver; treasurer, C. J. Rogers; and superintendent of public instruction, Edna B. Stolt. Justices of the state supreme court were Fred H. Blume, Ralph Kimball and William A. Riner. The state house of representatives, elected in Nov. 1948, was evenly divided (28–28) between Democrats and Republicans, and the state senate was predominantly Republican (18 Republicans and 9 Democrats).

Education.—In 1948–49 there were 580 elementary and rural schools in Wyoming with 1,118 elementary teachers and 520 rural teachers, and a total enrolment of 43,681. There were 88 accredited high schools, with 824 teachers and an enrolment of 13,475.

Social Insurance and Assistance, Public Welfare and Related Programs.—Funds spent on public welfare during the year ending Sept. 30, 1949, were as follows: old age assistance $2,742,562; aid to dependent children $536,585; aid to the blind $64,274; general welfare $366,068; child welfare $25,104; general welfare health $363,352.

There were three correctional institutions with inmates (average) and appropriations as follows: state penitentiary at Rawlins (310 inmates) appropriation $358,150; girls' school at Sheridan (45 inmates) appropriation $156,750, capital outlay $27,740; boys' school at Worland (48 inmates) appropriation $142,500, capital outlay $87,400. The appropriations are for the years 1949–50.

Communications.—During 1949 the Wyoming highway department let approximately 75 contracts for a total expenditure of $7,950,099. This work was spread over a total mileage of 512.64. The highway system in Wyoming at the year's end consisted of 4,595 mi., of which 1,220 mi. were secondary routes. It is a policy in Wyoming for the state to take into the state highway system all routes constructed with regular highway funds, including federal aid, unless there are peculiar circumstances or unusual conditions In 1948 the year closed with a total mileage of 4,496; therefore, it can be seen that the 512 mi. shown as the total of the contracts let served to increase the system by 99 mi. The remainder was for renovation and reconstruction of existing routes.

The 1949 maintenance budget, which covered the period ending April 1, 1950, was set at $2,500,000; it was anticipated that the budget would run over about 10%. Railroad mileage remained stationary at 1,912 mi.

Banking and Finance.—On Dec. 31, 1949, there were 29 state banks with deposits of $81,069,433.94. There were 24 national banks with deposits of $175,014,568. Total state receipts for the fiscal year ending Sept. 30, 1949, were $63,016,536.87. Total disbursements for the same period were $39,188,666.15. The bonded debt for the state on Sept. 30, 1949, was $1,020,000.

Agriculture.—Crop production in Wyoming during 1949 was slightly above the previous year. Farm products were valued at an estimated $66,000,000. Wyoming livestock on the farm was valued at $177,219,000 during the year 1949 (*See* Table II.)

Table I.—*Leading Agriculture Products of Wyoming*

	1949	1948	Average 1938–47
Corn, bu.	1,085,000	1,008,000	1,521,000
Winter wheat, bu.	6,364,000	5,100,000	2,779,000
Spring wheat, bu.	1,435,000	1,558,000	1,395,000
Oats, bu.	3,982,000	3,960,000	3,981,000
Barley, bu.	5,310,000	4,730,000	3,335,000
All hay, tons	1,283,000	1,018,000	1,241,000
Dry, edible beans, cwt.	1,089,000	1,197,000	912,000
Sugar beets, tons	392,000	310,000	467,000
Potatoes, bu.	1,870,000	2,280,000	2,087,000

Table II.—*Number and Value of Livestock in Wyoming*

	Number on Farms, 1949	Value
Cattle	1,011,000	$132,441,000
Hogs and pigs	85,000	3,018,000
Stock sheep	1,980,000	36,234,000
Sheep and lambs on feed	90,000	1,530,000
Horses	84,000	2,552,000
Mules	1,000	41,000
Chickens	789,000	1,169,000
Turkeys	28,000	235,000
Total		$177,219,000

In 1949, Wyoming ranchers sheared 1,782,000 sheep, producing 17,285,000 lb. of wool which sold for $8,297,000. It was estimated that there were 11,500 farms in Wyoming, the average size being 2,525 ac.

Mineral Production.—Mineral production in Wyoming for 1949 was estimated as follows: bituminous coal, 5,972,640 tons, estimated value at $47,780,000; oil, 47,467,000 bbl.; bentonite, 40,000 tons; and trona, 70,000 tons, the trona being processed as soda ash for fertilizer.

Employment.—Total employment in the state as of Dec. 1949 was estimated at about 114,546—55,250 of whom were covered by unemployment compensation. The largest single group, ranch and agricultural workers, was estimated at 30,000; railroad employees, 8,900; wholesale and retail trades, 18,306; employees of government (all levels), 14,100; service industries, 8,544; contract construction workers, 9,059; transportation, communication and utilities, 4,931; mining, 9,752; finance, insurance and real estate, 1,694; manufacturing, 7,020; professional, 2,186; and miscellaneous, 54. (A. G. Cr.)

X-Ray and Radiology.

Important advances were made during 1949 in angiography of the cardiovascular system of the chest and of the brain. Angiocardiography, the visualization of the thoracic blood vessels and the heart through the use of X-ray photographs, had been established as a practical method of diagnosis in 1938 by G. P. Robb and Israel Steinberg. During 1949 Steinberg, along with C. T. Dotter, published the results of 11 years' experience with the method. It had added materially to accuracy in diagnosis of intrathoracic disease. Along with cardiac catheterization it proved invaluable for accurate diagnosis in congenital heart disease, especially since many congenital anomalies could be corrected by surgical operations.

Cerebral angiography, used in the diagnosis of intracranial lesions, was originated in 1927 by Egas Moniz, of Lisbon, Portugal. Advances which took place in angiography during 1949 consisted in the provision and improvement of methods and apparatus. Two devices were perfected which greatly facilitated the roentgenographic technique, one called the seriograph and the other the roll film cassette.

The seriograph consists of a cassette magazine mounted in a portable cabinet adjustable in height to adapt it to various table heights. The cassette changer holds six specially designed cassettes, each with intensifying screens and each backed by a thin layer of lead to provide protection of underlying films during exposure. An exposure-activating device and an automatic cassette-shifting device operate in such a way that following each exposure the cassette is removed and an unexposed one shifted into position for the next exposure, the series continuing until completion of the six exposures. The device provides that the successive exposures are made at predetermined intervals—0.7 sec. for cerebral angiographs and 2.5 sec. for angiocardiographs. The exposure time for each film is set at 0.1 sec. or less, the total elapsed time for the six films being 4.5 sec. This apparatus serves to make films during the successive opacification of the arteries, capillaries and veins of the brain.

PLASTER MOULD of head of patient being used to check alignment of positioning device, prior to application of betatron's 25,000,000-ev X-ray beam for treatment of cancer. The betatron was being used in 1949 for cancer research and treatment at the University of Illinois college of medicine in Chicago

The roll film cassette consists of two main components—a motor base plate and a detachable roll film magazine. The capacity of the magazine is 75 ft. of film, $9\frac{1}{2}$ in. wide, and sufficient for approximately 75 exposures. Operation is accomplished automatically and continuously in conjunction with the X-ray tube control at the rate of two exposures per second. The film is automatically advanced in the magazine when the motor circuit is closed, and when the film is in proper position for exposure it is automatically compressed between two intensifying screens. A Bucky grid is in constant motion during the exposures.

Two important papers were published in 1949 which pointed to new possibilities in the application of radiation to the treatment of cancer. They dealt with the use of the betatron in the production and utilization both of free electrons and of roentgen rays at high voltages. The betatron is a machine by which electrons produced from a tungsten filament are injected into a vacuum chamber between the poles of an alternating current electromagnet and by the energy of the increasing electromagnetic field finally reach an energy of 20,000,000 ev. If it is desired to produce roentgen rays, the electrons are directed against a tungsten target. By removing the target it was possible to obtain a beam of electrons which could be controlled and directed outside of the machine and which at the high voltage of 20,000,000 ev could penetrate tissues to a depth far beyond that which was possible with the electrons produced by the voltages hitherto used for production of roentgen rays. They had an important advantage over roentgen rays in that their highest concentration of energy was not at their source but at the end of the beam. A beam of free electrons could therefore be applied in such a manner that its greatest energy was exerted in the tumour itself instead of in the skin and superficial tissues. While much experimental work was still necessary before this new agent could be practically and safely applied in the treatment of cancer, it offered hopeful possibilities for progress in this field.

It was not only in the production of free electrons that the betatron offered possibilities of advance but in the production of roentgen rays with the tremendous penetrating qualities afforded by the 20,000,000 ev energy. H. Quastler and his coworkers described the treatment of a single case of cancer of the brain by roentgen rays produced by the betatron at 20,000,000 ev. As was the case in the use of free electrons, this treatment was still in the experimental stage. (*See* also ATOMIC ENERGY; CANCER; PHOTOGRAPHY; TUBERCULOSIS.)

Yachting.

The winning of several major ocean and long coastwise races in different parts of the world by yachts of relatively light displacement type was a feature of the 1949 yachting season. On the Pacific, "Kitten," a 46-ft. over-all PCC class sloop owned by Fred W. Lyon, California, won the 2,225-mi. Los Angeles-to-Honolulu race. This was a fast, fair-wind race in which the scratch boat, Richard S. Rheem's 98-ft. schooner "Morning Star," set a new course record of 10 days 10 hr. 13 min. 9.5 sec. Prior to starting the Honolulu race on July 4, "Kitten" had opened her racing season in May by beating a fleet of 122 yachts in the 144-mi. Ensenada race in southern California and Mexican waters. A sister ship to "Kitten," Dr. Philip R. Smith's "Gossip," Seattle, won the Tri-Island series of three long-distance races in the Puget sound area.

In British waters Capt. John H. Illingsworth's sloop "Myth of Malham" won the stormy 600-mi. Fastnet Rock race, in which only 10 of the 29 starters finished. Earlier, Capt. Illingsworth had made the best corrected time in a big fleet of top-flight ocean racers in the cross-channel Cowes-Dinard race with "Minx of Malham," a smaller edition of "Myth," which he also owned and sailed. A sister ship to "Minx," Maj. R. Schofield's "Blue Disa," won another major British event, the Wolf Rock race. These widely separated triumphs focused interest of ocean-racing skippers on the controversial question of the desirability of lightly-built, racing-type craft for offshore competition.

In international six-metre class racing, Sven Salen, Sweden, sailing "Maybe VI," won the Scandinavian Gold cup in a series in Norway in which sixes from half a dozen countries participated. Four U.S. sixes racing at Cowes, Eng., "Goose," Dr. George Nichols, Jr., "Llanoria," Emil Mosbacher, Jr., "Fire-

LIGHTNING CLASS YACHTS nearing the finish line in the third heat for the international championship held in Biscayne bay, Fla., in Sept. 1949. Richard P. Bertram, defending champion, retained the title by winning two out of three of the races

cracker," Herman F. Whiton, and "Noa," James Sheldon, defeated a British team, four races to two, and permanently retired the British-American cup.

In addition to the ocean races mentioned above, long-distance sailing events in general were numerous and drew large fleets. In Florida waters Palmer Langdon's Rhodes-27 class sloop "Tiny Teal" won the St. Petersburg-Havana and Lipton Trophy races and took the Florida Governor's cup as the outstanding yacht in the five races of the "southern circuit." Other races in this group were the Miami-Nassau, won by "Blitzen," Murray Knapp and Ernest Grates; the Cat Cay race, won by "Katuna," Gilbert Verney, and the Nassau Governor's Trophy race, won by "Malabar XIII," Morgan Butler. Other long-distance race winners during the year included "Alar," David Z. Bailey, Newport-Annapolis race; "Onkahya," George Sollitt, Bayview-Mackinac race; "Taltohna," E. B. Tolman, Jr., and "Cara Mia," L. L. Karas, Chicago-Mackinac race; "Valkyrie," John MacDonald, Marblehead-Halifax race; "Chanteyman," E. L. Raymond, Jr., Stamford-Vineyard race; "Avolonte," A. G. Woodley, Swiftsure Lightship race, and "Revonoc," Harvey Conover, Storm Trysail club's Block Island race.

Among international class champions crowned during the year were Harry G. Nye, Jr., Chicago, Star class; Richard Bertram, Miami, Lightning class; Ted Wells, Wichita, Kan., Snipe class; and Howard Lippincott, Riverston, Del., Comet class. Charles Currey, British dinghy skipper, won the Princess Elizabeth trophy for 14-footers in a Bermuda-Canada-England-U.S. series held at Bermuda. U.S. teams defeated Bermudians twice in a home-and-home series in International class sloops, and once in an L-16 class team series at Greenwich, Conn.

American national champions who won their titles during the year included the Yale university crews, which took the intercollegiate Morss bowl; the Cohasset (Mass.) Yacht club crew headed by Kingsley Durant, winners of the Sears bowl and national junior title; and the Portland (Me.) Yacht club crew headed by Jane Smith, which took the national women's championship.

While the trend in yachting throughout the world continued to be toward smaller yachts, the New York Yacht club cruise, stronghold of the larger yachts, brought out its largest fleet in several years. Winners of some of the historic trophies during this event were the new yawl "Bolero," John Nicholas Brown, winner of the Astor cup; the 12-metre class sloop "Anitra," W. Mahlon Dickerson, which took the King's cup, and "Niña," DeCoursey Fales, awarded the Cygnet cup as the outstanding schooner of the season. (W. H. Tr.)

Yeast. During 1949 it was announced that the chromosomes of the common yeast *Saccharomyces* had been mapped, so that this yeast had become as useful as the fruit fly, corn and the pink bread mould in the study of experimental breeding. As a result of this development, plus the thorough knowledge of the enzymatic constitution of the yeast cell, plus the ease with which yeast may be handled by standard bacteriological procedures, yeast became a prime subject for fundamental studies of physiology and biochemical genetics. Much of the basic biological research done with yeast during the year was aimed toward ultimate application to the human being, as demonstrated by the support of such research by organizations fostering the quest for the cause and cure of cancer. Extension of biochemical findings made with yeast to the animal organism was further validated by proof during 1949 of the basic similarity between cell-free fermentation of yeast and animal tissue glycolysis (breakdown of animal starch).

Although studies of yeast physiology published during 1949 were too numerous to list completely, the following are cited as representative: several steroids and diethyl stilbestrol were found to stimulate the endogenous respiration of yeast; the Harden-Young effect in cell-free alcoholic fermentation of yeast was attributed to removal, destruction or inhibition of adenosine triphosphatase; it was suggested that the toxicity of selenate to yeast results from a blocking of synthesis of the amino acid methionine; some yeasts were shown to be able to utilize certain amino acids as carbon sources for growth; the requirements of brewery yeasts for growth and fermentation factors were explored by means of synthetic media.

Advances during the year in technological applications of yeast included: in the baking industry fermentation activity and survival of yeast in frozen fermented and unfermented doughs were studied; in the dairy industry yeast was found to play an essential role in surface ripening of brick cheese; in the wine industry inoculation with ester-producing yeasts was used to enhance flavours of wines. A yeast fermentation producing nearly a pound of fat from a gallon of molasses received attention from the United Nations Scientific Conference on the Conservation and Utilization of Resources.

Among discoveries during 1949 in the field of yeast production, certain food yeasts were shown to be able to utilize for growth nonsugar compounds in molasses; a synthetic medium giving high yields of yeast was reported; asparagus waste and citrus peel press liquor were added to the list of by-products suitable for use as substrates in yeast production.

Isotopically labelled nucleic acid was prepared from yeast and was used to study the metabolism of nucleic acid in animals. The nucleic acid content of yeasts was shown to depend upon the substrate and conditions of cultivation. The effect of yeast autolysate in elevating body temperature when injected subcutaneously, but lowering body temperature when injected intraperitoneally, was attributed to the nucleic acid present in the autolysate. Yeast cells were used to study the food selectivity of oysters.

(F. W. N.)

Yemen. An independent state in the southwestern tip of the Arabian peninsula, Yemen lies between Saudi Arabia to the north, the British Aden protectorate to the southeast and the Red sea to the west. Area: *c.* 31,000 sq.mi.; pop. (1948 est.): 1,600,000. Language: Arabic. Religion: Moslem. Capital: San'a (pop. est. 25,000). Ruler: Sayf al-Islam Ahmad ibn Yahya.

History.—The isolation of Yemen during 1949 was greater than it had ever been. After the overthrow of Abdullah Ibn Ahmed al Wazir's regime in 1948 and the numerous executions of leading men which followed, the new imam did not return to San'a but set up his capital at Ta'izz. Conditions continued unsettled. A revolt of Rasasi tribesmen broke out in February and was crushed by the imam, who was reported to have executed 33 tribal leaders. British royal air force aircraft from Aden were reported to be making bombing raids on border forts early in March owing to violations of British territory by the tribesmen. On Sept. 2, after giving due warning, R.A.F. bombers destroyed a fort which was being erected by Yemenis in the territory of the western Aden protectorate.

Yemen took very little part in the proceedings of the Arab league. Trade negotiations were carried on with Egypt and with India by Qadi Muhammad Ibn Abdullah al-Imari, a special envoy of the imam. A trade agreement with Lebanon was signed in February. Relations with Great Britain were discussed with the imam at Ta'izz in Nov. 1948 by the governor of Aden, Sir Reginald Champion, who in Feb. 1949 conveyed to London Yemen's requests for British technical and medical assistance. In March it was announced that Sir Reginald would be British representative in Yemen as well as governor of Aden. The imam underwent an operation in March, an Italian surgeon having been brought by air from Asmara, Eritrea. In November it was reported that most of Yemen's remaining Jews had been evacuated through Aden to Israel.

Finance.—The monetary unit is the Maria Theresa dollar, called the riyal, nominally=Rs.1 (Indian), or 21 cents U.S. (Nov. 1949). (C. He.)

Foreign Trade.—Principal imports are manufactured goods. Principal exports are coffee, barley, wheat millet, hides, charcoal, raisins.

Young Womens Christian Association: *see* SOCIETIES AND ASSOCIATIONS.

Yugoslavia.

A federal People's Republic of southeastern Europe, Yugoslavia is bounded on the north by Austria, on the north and northeast by Hungary and Rumania, on the east by Bulgaria, on the south by Greece and on the west by Albania, the Adriatic sea and Italy. Area: (1940) 95,983 sq.mi.; (1947, including newly acquired territory of Julian march, Zara and the islands [2,843 sq.mi.]) 98,826 sq.mi. Pop. (1940 est.): 15,703,000. Federal republics (pop., March 15, 1948 census):

	Population	Capital	
Serbia (with the autonomous province of Vojvodina and the autonomous Albanian region of Kosovo-Metohija)	6,523,224	Belgrade	(388,246)
Croatia	3,749,039	Zagreb	(290,417)
Slovenia	1,389,084	Ljubljana	(120,944)
Bosnia and Hercegovina	2,561,961	Sarajevo	(118,158)
Crnagora (Montenegro)	376,573	Titograd	(12,206)
Macedonia	1,152,054	Skoplje	(91,557)
Total	15,751,935		

Other towns (pop., 1948 census): Subotica (112,551); Novi Sad (77,127); Rijeka, formerly Fiume (72,130). Languages: Serbo-Croat, Slovene and Macedonian; Albanian, Hungarian and Italian are also spoken by the minorities. Religions (1931 census): Greek Orthodox 48.7%; Roman Catholic 37.5%; Moslem 11.2%.

Chairman of the presidium of the people's assembly, Ivan Ribar; prime minister, Marshal Josip Broz (Tito) (*q.v.*).

History.—During the year 1949 Yugoslav-soviet relations continued to deteriorate. When the Paris conference of the Council of Foreign Ministers (*q.v.*) reached an agreement in June on the settlement with Austria which denied Yugoslavia its territorial claims in Carinthia, the Yugoslav government protested to the four powers. On June 22 the soviet government rejected the Yugoslav protest in an angry note, which accused Yugoslavia of having conducted secret negotiations with Great Britain on the Austrian question in 1947, "behind the back" of its soviet ally. A further soviet note of Aug. 12 described in detail these alleged negotiations and concluded that Yugoslavia was behaving "not as an ally but as an enemy" of the U.S.S.R. It also alleged that some strong and secret ties bound the Yugoslav government to the "camp of the foreign capitalists." A week later the soviet government accused the Yugoslav government of maltreating soviet subjects and stated that, if this continued, it would "have resort to other more effective means" to protect its subjects. The Yugoslav reply to this note drew a further reply from Moscow which included a long lecture on how Marxists ought to behave, illustrated with examples from the history of the Russian Bolshevik party. Following the Rajk trial in Budapest (*see* HUNGARY), the soviet government formally denounced on Sept. 27 its treaty of alliance with Yugoslavia (signed in April 1945). Within the next few days, Hungary, Poland, Rumania, Bulgaria and Czechoslovakia denounced their treaties with Yugoslavia.

The economic boycott of Yugoslavia by the Cominform countries was tightened during the first six months of 1949. The soviet-Yugoslav trade agreement of Dec. 1948 reduced the volume of mutual trade for 1949 to one-eighth of that of 1948. In June and July trade between Yugoslavia and Czechoslovakia, Poland and Hungary—the three Cominform countries whose exports were of greatest importance for Yugoslav economic planning—was brought to a standstill.

The Cominform boycott compelled the Yugoslav Communist leaders, with obvious reluctance, to seek greater trade, and to request credits, in the west. A short-term trade agreement with Great Britain was signed in Jan. 1949, providing for an exchange to the value of £15,000,000, up to Sept. 30, after which a more far-reaching agreement was to be made. In August an agreement was made with Italy, by which the value of mutual trade in 1949-50 was to be more than double that of the previous year. During the same month the United States government permitted the sale to Yugoslavia of a large steel plant and the International Monetary fund sold Yugoslavia $3,000,000 in return for the equivalent sum of Yugoslav dinars—which in effect amounted to a dollar loan. In early September the U.S. Export-Import bank gave a credit of $20,000,000, of which $12,000,000 were to be spent on U.S. equipment for the rehabilitation of Yugoslav mines.

Yugoslavia's economic situation remained critical during the year. Official statistics gave the usual optimistic percentage figures for the achievement of the five-year plan targets. But in fact the achievement was much smaller than the figures.

The need for manpower in factories, public works and mines was the main motive behind the collectivization of agriculture which had made more rapid progress in Yugoslavia than in any other country of eastern Europe. Collective farms, with their managing committees controlled by the Communist party, provided a more efficient central control of the state bureaucracy over the peasant masses than had ever yet existed. During the first six months of 1949 the number of collective farms (peasant labour co-operatives) rose from 1,300 to 4,500. In August about 20% of Yugoslav agriculture was collectivized, and in the richest agricultural province—Vojvodina—the proportion was nearly 40%. Yugoslav collectivization was fiercely denounced by Cominform propaganda because it was not accompanied by a thorough class war against the kulaks in the villages. The reason for the comparatively mild treatment of the more prosperous peasants who, in contrast to the rule in Cominform countries, were allowed in Yugoslavia to join collective farms, was that Tito's government, faced with external threats and internal economic crisis, was understandably eager to minimize the discontent.

There was absolutely no political liberalization. The Serbian and Croatian peasant party leaders were still in prison. The wishes of the non-Communist masses were ignored as before. Anti-Communist opinions were crushed no less ruthlessly than Cominformist Communist opinions. Tito counted on the patriotism of his people to back him against the external threat even if they disliked his regime. In the short term he was probably right, but he succeeded at the cost of a low national morale.

The most important action in Yugoslavia's own foreign policy was the decision to close the frontier with Greece, announced in July. Official Yugoslav spokesmen insisted that this action was directed equally against the Greek rebels and the Greek "monarcho-fascist" government. In practice, it operated in favour of the government. Ideological factors prevented friendship be-

MEMBERS OF A "VOLUNTEER" YUGOSLAV LABOUR BRIGADE on their way to a rural hay-cutting contest in 1949, with their long-handled scythes over their shoulders

tween the Yugoslav and Greek governments. But at least the Greek government was doing no direct harm to Yugoslavia, whereas the leaders of the Greek rebels, after the dismissal of Markos Vafiades in Jan. 1949 (*see* Greece), began to support the Bulgarian-sponsored agitation for a united Macedonia to be liberated from both Greece and Yugoslavia. The closure of the frontier put an end to Yugoslav help to the Greek rebels and greatly diminished the usefulness of Albania as a base for the rebels.

The negative *rapprochement* between Greece and Yugoslavia, resulting from the closure of the frontier, not only contributed to the defeat of the rebels by Greek national forces during the summer but provided the Soviet Union with a further motive for hatred of Yugoslavia. The only remaining soviet vassal on the Adriatic, Albania, was linked with the Cominform world only by occasional soviet, Rumanian or Polish ships which had to pass through the Turkish straits or through the Baltic and Gibraltar. The strategic importance of Macedonia in soviet eyes increased, as it was a link not only from north to south—from central Europe to the Aegean—but also from west to east—from Adriatic to Black sea.

At the end of the year Yugoslavia's position was dangerous but not impossible. Tito and his colleagues were experts both in guerrilla warfare and in police terror. It was unlikely that rebellion in Macedonia would hold great terrors for them. Nor had they much reason to fear the attack of their satellite neighbours. Despite a barrage of insults, and a violent protest by A. Y. Vishinsky when Yugoslavia was elected to the U.N. Security council in October, there was no sign that the U.S.S.R. planned invasion. The attitude of the western powers in the event of invasion was also uncertain. (*See* also Albania; Trieste, The Free Territory of.)

(H. S-W.)

Education.—(1947–48) Schools, elementary 12,052, pupils 1,616,002, teachers 23,889; secondary 942, pupils 310,185; technical 1,307, pupils 121,137; teachers' training colleges 53, students 16,145; institutions of higher education: faculties 32, students 43,625; high schools 17, students 2,798. Illiteracy (1931): 45.2%.

Finance and Banking.—Budget (1949 est.) balanced at 161,953,000,000 dinars; (1950 est.) balanced at 173,746,000,000 dinars. Monetary unit: dinar with an official exchange rate of 2 cents U.S. (Dec. 1949).

Foreign Trade.—Imports: (1947) 14,435,000,000 dinars. Exports: (1947) 8,637,000,000 dinars.

Transport and Communications.—Roads (1940): 20,906 mi. Licensed motor vehicles (Dec. 1948): cars 10,600, commercial vehicles 4,200. Railways (1940): 4,319 mi. Shipping (July 1948): merchant vessels 103, total tonnage 202,615. Telephones (1948): subscribers 66,495. Radio sets licensed (1947) 220,256.

Agriculture.—Main crops (metric tons): maize (1947) 4,000,000; wheat (1946) 1,803,000; barley (1946) 194,000; oats (1946) 154,000; rye (1946) 170,000; potatoes (1947) 800,000; sugar, raw value (1948) 95,000; cotton, ginned (1948) 3,000; hemp (1947) 34,000; flax (1947) 3,000; tobacco (1945) 13,000. Livestock (Dec. 1946): cattle 2,493,000; sheep and goats 6,355,000; pigs 2,763,000; horses used in agriculture 613,000; chickens 16,000,000.

Industry.—Industrial establishments (1939) 3,254. Coal (metric tons, 1940) 421,000; lignite 6,888,000. Raw materials (metric tons): copper ore (1947) 30,000; lead (1947) 50,000; bauxite (1944) 150,000; zinc ore (1947) 30,000.

Yukawa, Hideki (1907–), Japanese physicist and Nobel prize winner, was born in Tokyo and educated at Kyoto. He became professor of physics at Kyoto university in 1939, and in 1948 went to the U.S. at the invitation of J. Robert Oppenheimer to work at the Institute for Advanced Study at Princeton, N.J. He was the first Japanese scientist to be so invited to the U.S. after World War II. During the 1949–50 academic year he was visiting professor of physics at Columbia university, and it was there he received word of his award of the 1949 Nobel prize for physics. This was given for his theoretical reasoning that anticipated the discovery of the meson, which Yukawa described as a particle "in between matter and energy."

Yukon Territory. Yukon, the most northwesterly political division of Canada, created in 1898, is bounded by Alaska, British Columbia, the Northwest Territories and the Arctic ocean. Area: 207,076 sq.mi.; pop.: (1941) 4,914, (1949 est.) 8,641 (including 1,447 Indians and 53 Eskimos). The capital is Dawson; the territory is administered by a three-member territorial legislative council, has one federal member of parliament and is controlled federally by a commissioner and an administrator.

History.—In the 1948–49 fiscal year the federal government collected $1,655,463 revenue in the Yukon and expended $3,117,335 for administration and development. To encourage tourism and protect game, the post of superintendent of game and publicity was created and filled. Effective April 1, 1949, a new old-age and blind pensions arrangement was made between the territory and the federal government, by which the latter contributed 75% of the basic monthly pension of $40 and the territory paid the rest. The federal department of health and welfare sent a mobile X-ray unit up the Alaska highway to provide tuberculosis examination for all white and Indian settlers; to reach nonhighway settlements the unit travelled by boat and air. A survey of the hydroelectric potentials of the Mayo Landing district was begun.

Transportation.—River traffic flourished during 1949, with six stern wheel steamers in operation. In 1948 there were 19,282 tons of freight moved by river, including ore, and 7,297 passengers. The rich gold-mining area of Atlin, B.C., formerly accessible only by air in summer and tractor train in winter, was connected with the Alaska highway in 1949 by construction of a $450,000 58-mi. all-weather road to Jake's Corner (Mile 867 on the Alaska route). Since the new road was 31.66 mi. in British Columbia and 26.35 mi. in the Yukon, it was jointly sponsored by the British Columbia and the federal governments, while construction was carried out by the royal Canadian engineers of the Northwest Highway system of the Canadian army. To connect the Alaska highway with Dawson and Mayo Landing, the federal government undertook conversion of the Whitehorse-Mayo Landing-Dawson trail into an all-weather road, and in 1949 the Mayo Landing-Carmacks sector was practically completed. Air transportation was stepped up slightly in 1949, and Canadian Pacific Air Lines connected Yukon points daily with Vancouver and Edmonton, and operated a twice-weekly shuttle from Whitehorse to Mayo Landing and Dawson. In addition to the military airfields and flight strips of the Northwest Staging route, 11 other regular and emergency airfields were kept open.

Furs.—Production took a decided jump from the 58,777 pelts caught in 1947 to 131,227 in 1948 (high for the 1943–47 period being 107,252 pelts). However, squirrels accounted for 94,743 pelts; muskrat was next high with 30,686; others included marten 1,433, weasel 1,377, lynx 1,190, mink 812, fox 720. The total value of the 1948 catch was $230,117.

Minerals.—In 1949 the Tantalus Butte coal deposits were worked, but production was restricted because of transport problems. Surveys were progressing for completion of a road to join the mines with Mayo Landing. During 1948 mineral production included 60,614 fine oz. of gold, 1,718,618 oz. of silver, and 4,598,665 lb. of lead. The total value was $4,265,910, compared with $2,095,508 for 1947. (C. Cy.)

Zanzibar: *see* BRITISH EAST AFRICA.

Zinc. World production of zinc advanced by 6% in 1948, to a level above that of 1939. The outputs of the important producing countries and the estimated world totals during the past several years are shown in Table I.

Smelters in most of the European countries were up to or past their prewar outputs, and the deficiencies in Germany and Poland were more than offset by increases elsewhere.

Table I.—*World Production of Zinc*

(In thousands of short tons)

	1939	1943	1944	1945	1946	1947	1948

Total	1,820	2,030	1,790	1,400	1,550	1,760	1,865

United States.—In 1948 mine output, smelter output and imports all fell short of the 1947 level, cutting the supply at the same time consumption was increasing. The salient features of the zinc industry in the United States are shown in Table II, as reported by the U.S. bureau of mines.

Table II.—*Data of Zinc Industry in the U.S.*

(In thousands of short tons)

	1939	1943	1944	1945	1946	1947	1948
Mine production	583.8	744.2	718.6	614.4	574.8	637.6	630.0
Smelter production	507.2	942.3	869.3	764.6	772.4	802.5	787.8
Domestic ores	491.1	594.2	574.5	467.1	459.2	510.1	538.0
Foreign ores	16.2	348.1	294.8	297.5	269.1	292.4	249.8
Imports	67.0	593.2	486.3	478.8	376.8	370.3	357.5
In ore	36.1	537.0	422.7	381.7	272.1	298.0	264.2
Metal	30.9	56.2	63.6	97.1	104.7	72.4	93.3
Secondary recovery	189.6	368.5	345.5	360.4	300.7	310.8	324.6
Stocks	?	261.0	298.5	328.6	269.2	149.3	117.4
Producers'	86.3	170.6	233.7	256.2	176.2	68.6	20.8
Consumers'	?	90.4	64.8	72.4	93.0	80.8	96.6
Consumption	626.0	816.8	888.6	852.3	801.2	786.4	817.7

There was another small decline in mine output in 1949, but smelter output increased slightly, assisted by larger imports of ore.

Canada.—The recoverable zinc content of Canadian ores rose from 207,863 tons in 1947 to 234,164 tons in 1948, of which 196,575 tons was produced locally as refined zinc and 37,589 tons was exported in ores and concentrates. The improved production rate was continued in 1949, with a total of 212,544 tons in the first nine months, of which 156,706 tons was refined zinc output. After midyear 1949 the exports of zinc in ore and concentrates more than doubled over the preceding rate, and reached a total of 72,365 tons through September. (G. A. Ro.)

Zonta International: *see* SOCIETIES AND ASSOCIATIONS.

Zoology. The need to counteract the effects of increasing specialization was met, at least in part, by the publication in 1949 of the first volume of an annual *Survey of Bio-*

WILD ELEPHANT (centre) newly captured in the African bush. The young captive, shown between two monitor elephants, was to be trained to work on a plantation or sold to a zoo. The annual elephant hunt undertaken by the Belgian Congo's elephant domestication station was illustrated in photographs at the Heads and Horns museum of the Bronx zoo, New York city, in 1949

logical Progress under the editorship of G. S. Avery, Jr. The International Society for Cell Biology announced a new journal, *Experimental Cell Research,* the first issue of which (supplement I) contained the Proceedings of the 6th International Congress of Experimental Cytology.

The American Society of Zoologists met jointly with the American Association for the Advancement of Science in New York, N.Y., Dec. 28–30, 1949. There were 270 papers scheduled for this meeting compared with 204 in 1948. The fact that 108 (40%) of these were concerned with cellular or general physiology should not be taken as an indication of a trend, for zoological interests were appealed to by other societies which met simultaneously—societies devoted to specialized interests in parasitology, systematic zoology, microscopy, ecology, evolution, and genetics.

Research and Publication.—No estimate of the total number of publications was available, but it may be said that research papers and books of zoological interest numbered several thousand. Only a small sample of these can be mentioned here.

Embryology and Cytology.—By mating female salamanders (axolotls) which had either one or two extra sets of chromosomes (that is, were either triploid or tetraploid) with normal males, R. R. Humphrey and G. Fankhauser succeeded in obtaining three generations of animals with extra chromosome sets. The sterility of many such females and of all such males so far obtained made it appear unlikely that a similar process would effect the formation of new species in nature.

Paul Weiss (chapter VII, *The Chemistry and Physiology of Growth,* edited by A. K. Parpart), in his review of differential growth, called for a reorientation of analytical embryology toward "greater precision, objectivity, and consistency in the description and interpretation of phenomena . . ." and carried out his mandate by interpreting growth and differentiation in molecular terms. He pointed out that growth was an ill-defined term connoting diverse processes and that "There can be no research on growth as such. We can only study growing objects."

Behaviour.—The unresolved problem of homing in birds was further investigated by D. R. Griffin and R. J. Hock who used an aeroplane to follow the flights of gannets released up to 213 mi. inland from their nesting sites on Bonaventure Island. Thirteen of the 22 released returned. The birds took off from the release points in apparent random orientation. The authors suggested that they first explored, perhaps by flying in ever widening spirals, till they reached the coast. They then may have utilized familiar landmarks to guide them home.

W. H. Thorpe worked with K. von Frisch at Brunnwinkl and confirmed the latter's remarkable studies on communication in the honey bee. Briefly, when a worker bee discovered pollen or nectar within 50 to 100 m. of the hive she executed a "round dance" on the comb; fellow workers became "excited" and left the hive to begin a random search for food nearby. If, however, food was 100 m. or more from the hive, the returning worker performed a "waggle dance" on the vertical surface of the comb. The worker followed a broad figure eight and performed waggles when crossing the connecting bar of the figure. The other bees followed in contact with the dancer and then left the hive and flew directly (with an error in direction of not more than 3°) to the food. It appeared that the direction of the waggle run gave a clue to the direction of the food in relation to the direction of the sun. Thus a vertical run meant that the food was in a direct line in the direction of the sun; a run 30° to the left of the vertical indicated that the food was at the same angle to the left of a line connecting the hive and the sun; a vertical run downward indicated that the food was directly opposite to the sun; and so on. The rate at the which waggle dances were performed was inversely related to the distance of the food. Thus, waggle runs completed at the rate of 40 per minute indicated food at 100 m., 68 per minute food at 1,500 m. and so on. The "informed" workers responded by flying to within 100 m. of the food before beginning a search. Thorpe compared the whole performance with human map making and map reading. Presumably, the bees oriented themselves by gravitational cues which they were then able to relate to the sun's direction.

Ecology and Natural History.—Of general ecological interest were Charles Elton's essay on animal community patterns and the monumental body of carefully analyzed data brought together by W. C. Allee, A. E. Emerson, O. Park, T. Park, and K. P. Schmidt in their *Animal Ecology*, a book that promised to be a landmark in the field. G. E. MacGinitie and Nettie MacGinitie published the results of years of field and laboratory study in their *Natural History of Marine Animals.*

The publication of studies based on the material collected during the Danish world oceanographical expedition of 1928–30 was continued by Grace E. Pickford's account of the external anatomy of an archaic cephalopod (a group including the octopus and the squid), specimens of which were taken at depths of 300 to 3,000 m. in tropical and subtropical waters of the Atlantic, Pacific, and Indian oceans. These cephalopods were more closely similar to certain Mesozoic fossils than to members of any living orders previously described.

Although whales had, in late years, been thought to be closely akin to the Carnivora, A. Boyden and D. Gemeroy, using precipitin tests to compare the blood sera of whales and members of 14 mammalian orders, concluded that they were most nearly related to the even-toed ungulates (*Artiodactyla*).

G. R. Seaman reported that a ciliated unicellular animal, *Tetrahymena geleii,* when adapted to growth in a sucrose (sugar) solution, appeared to utilize atmospheric nitrogen. This aroused much interest for it had hitherto been thought that such a capacity was confined to certain bacteria and blue-green algae. Confirmation would be necessary before this result would be generally accepted. (*See* also ENDOCRINOLOGY; ENTOMOLOGY; GENETICS; MARINE BIOLOGY; PALEONTOLOGY.)

Zoological Parks.—*Africa.*—Since the capture and exportation of most rare and even scarce mammals and birds had been placed under government control in British, French and Portuguese colonies, the various game departments had built small zoos in which the animals were accumulated and acclimatized before being sent abroad. The instigation of this strict and responsible management was generally approved.

Asia.—Although extensive collections had been exported from Asia to the rest of the world, the state and private collections, especially the notable ones of India, were being disposed of.

Australia.—In late years the several older zoos, and the more recently established park-sanctuaries, had made special effort to secure a great variety of native animals; they maintained these with remarkable success in spite of the special requirements and many problems which confronted them. Platypuses were shown in most collections as were the lyrebird and koala, this "difficult" species having been captive-bred and raised at Lone Pine Park, Queensland. During 1949 the two largest and most diverse collections of New Guinea animals were brought by E. J. Hallstrom and his collectors to Sydney; the collections included more than 25 kinds of birds of paradise.

Europe.—During the summer of 1949 the first incidence of plague disease in mammals within recent years was reported to have occurred in the Rome zoo. Animals imported from Italian Somaliland were rinderpest carriers; all ruminant animals in the collection were destroyed and the disease was stamped out. H. Hediger, Zoological garden, Basle, Switz., and G. S. Cansdale, London zoo, were elected president and secretary of the International Union of Directors of Zoological Gardens.

United States.—The roster of the American Association of Zoological Parks and Aquariums indicated that as of the close of 1949 there were 149 public collections maintained in the United States and Canada. At the annual meeting of this association, Mrs. Belle Benchley, executive secretary of the Zoological Society of San Diego, Calif., was elected president. Extensive building programs and the rehabilitation of old structures and landscaping effects in most zoological parks were reinstated; these included the building of a house for great apes in New York city, house and barless enclosures for the large and small cats of the world in Philadelphia, Pa., and a bird house in Cleveland, O., the latter of such capacity and with such facilities that birds of all orders and environments might be shown in it.

INDEX

The black type entries are article headings and cross references. These black type article entries do not show page notations because they are to be found in their alphabetical position in the body of the book, but they show the dates of the issues of the *Book of the Year* **in which the articles appear.** For example **"Air Races and Records 50, 49, 48, 47"** indicates that the article "Air Races and Records" is to be found in the *1950 Book of the Year*, the *1949 Book of the Year*, the *1948 Book of the Year* and the *1947 Book of the Year*. The reference **"Radiology:** *see* **X-Ray and Radiology 50, 49, 48, 47.** *See* **Radiology 46"** indicates that information on "Radiology" is to be found in the article "X-Ray and Radiology" in the *1950 Book of the Year*, the *1949 Book of the Year*, the *1948 Book of the Year*, the *1947 Book of the Year* and under the heading "Radiology" in the *1946 Book of the Year*. **All black type entries without dates indicate that the same entries appear in all the last five issues. Examples,** not **Advertising 50, 49, 48, 47, 46,** but **Advertising;** not **Abyssinia:** *see* **Ethiopia 50, 49, 48, 47, 46,** but **Abyssinia:** *see* **Ethiopia.**

The light type headings which are indented under black type article headings and cross references refer to articles elsewhere in the text (of this issue only) related to the entry listed in black type. The light type headings which are not indented refer to information in the text not given a special article. Those which show page references refer to this issue only. Those which refer to the article **Obituaries** are followed by the date of issue in which the obituary appears.

All headings whether consisting of a single word or more are treated for the purpose of alphabetization as single complete headings. Names beginning with "Mc" and "Mac" are alphabetized as "Mac"; "St." is treated as "Saint." All references below show the exact quarter of the page by means of the letters *a*, *b*, *c*, and *d*, signifying respectively the upper and lower halves of the first column and the upper and lower halves of the second column.
